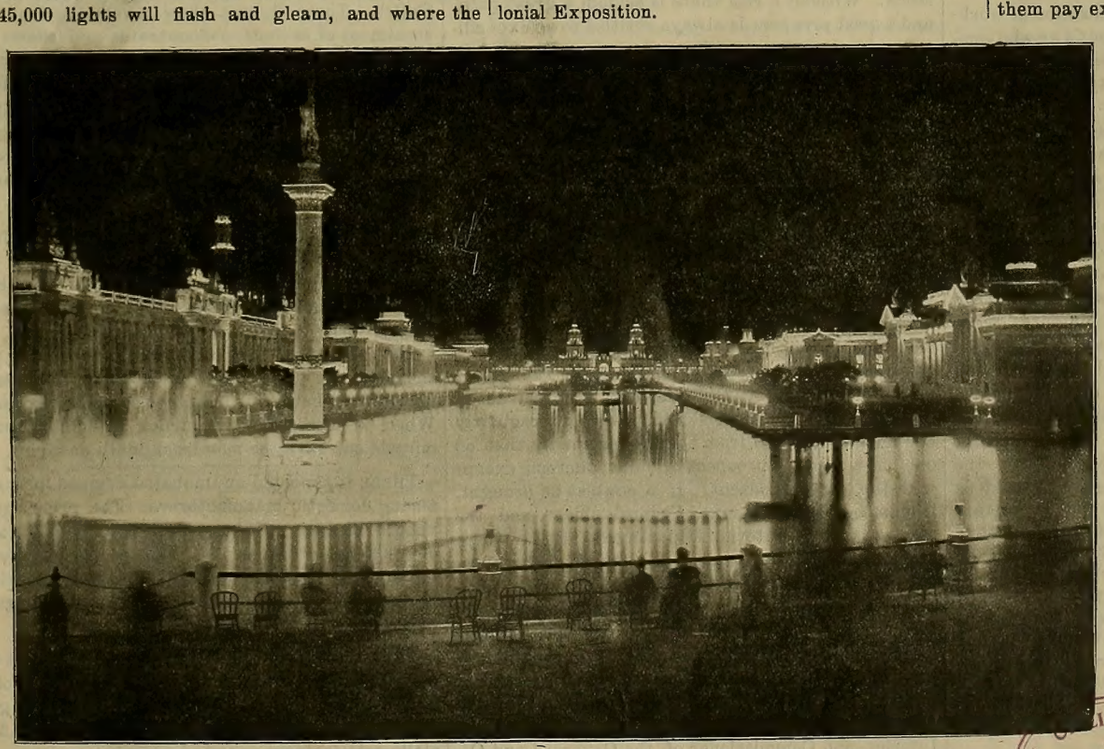
MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 2034.—VOLUME LXXIX. Number 1. SAN FRANCISCO, SATURDAY, JULY 1, 1899. THREE DOLLARS PER A... Single Copies, Ten Cent...



An Electrical Display.

The electric features of the Greater America Exposition to be held in Omaha, Neb., from July 1st to November 1st, '99, promise to maintain the high standard previously set for night illumination. Those who last year witnessed the nightly decorative lighting accomplished in the Grand Court of the Transmississippi Exposition, and even those who had vividly in memory the results attained at the World's Fair at Chicago, were pleased to acknowledge its merit. It is not intended that the results are to be attained by simply increasing the quantity of light, though a fair increase has made it possible to develop advantageously some points prohibited last year, but it is intended to bring out the many sculptured details in clear relief, with a strong effect, much as the star actress in an opera is emphasized by the calcium. Work has been progressing in the electric department rapidly, under the superintendency of Henry Rustin. To realize how much has been done, it must be understood that the wiring and plant of the Transmississippi Exposition were entirely dismantled and put in store.

ELECTRICAL DISPLAY AT OMAHA, NEB.

All the wires and lamp receptacles on the buildings in and around the Grand Court are in place and ready to be lighted up for a test. No ordinary obstacle could intervene to prevent the lighting this year being all that is hoped for. The illustrations shown herewith give an idea of the scene in the "Grand Court of Honor," where 45,000 lights will flash and gleam, and where the electric fountain will play in a radiance of rainbow tints. On the bluff tract and the Midway the lighting will be fine; a race track is being arranged and preparations made for lighting it so that races may be run at night. This will be one of the many new and novel features of the Greater America Colonial Exposition.

ELECTRICAL FEATURE OF THE OMAHA "GREATER AMERICA" EXPOSITION.

Among the several branches of the mining industry in California, that of mining for quicksilver is carried on with so little stir as to attract scarcely passing notice, and yet among the mines operating in this field an unusually large proportion are profitable and are paying dividends regularly, and some of them pay extras. Several mines operated years ago and long since closed are being reopened, notably in Solano and Sonoma counties, it is reported, with good prospects of success. Quicksilver mining is a very interesting business, and the mines are found mostly along the coast range counties from San Luis Obispo as far north as Trinity, with occurrences of cinnabar in other scattered localities throughout the State. The once great mines of New Almaden are still in successful operation, but in a comparatively small way. The occurrence of gold with cinnabar in California is of mineralogical importance only.

Barrel chlorination, which is so largely and successfully applied to the treatment of ores in South Dakota and Colorado, is not in use in California. The only barrel chlorination plant ever installed in the State was at the Mayflower mine, near Amador City, Amador county, but for some reason it did not prove a success. It may be considered rather as an experimental plant than otherwise, for all ores susceptible of treatment by the Plattner process so commonly in use are equally susceptible to treatment by the barrel process, and, it is claimed, at a lower cost.

CALIFORNIA STATE LIBRARY

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Largest Circulation of any Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.
Telephone Number, Davis 771.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....Publisher

San Francisco, July 1, 1899.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Electrical Display at Omaha, Neb.; Electrical Feature of the Omaha "Greater America" Exposition, 1. Mohegan Cyanide Mill, Red Bluff, Montana, 4. Peculiar Effects of Subterranean Corrasion of Rocks; Electrolytic Metallurgy; Some Experiences of a Working Miner, 5. Wire Wound Flywheels; Not a Menace to Non-Interfering Travelers; Luminosity of a Nernst Lamp is Deceptive; Large Dividend Payers; Gold Production of the World; Portland Cement Made from Slag; Aluminum Feed Wires for an Electric Road, 6. Latest Mining and Metallurgical Patents, 7. Amalgamated Copper Plates; Official Statement of Annual Gold and Silver Production, 8. Diamond and Gold Mining in Minas Geraes, Brazil; Electrical Equipment of Cripple Creek, Colo., District; Large Masses of Copper, 9. Index to Volume LXXIII, 10-11-12. Industrial Notes, 15. Personal; Recent California Dividends; Recent Mining Incorporations; Commercial Paragraphs; Catalogues Received; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; School of Engineering Graduates, 16.

TWO DAILY NEWSPAPERS in San Francisco, temporarily posing as "friends of labor," have joined the ranks of those who pretend to see State and Federal opposition to organized labor in the present restrictions imposed at Wardner, Idaho. The distinction is clear and well understood everywhere. There is no State or Federal fight against organized labor in Idaho. The only ones that are hurting the cause of organized labor there are the men who have taken its name in vain—men who are guilty of arson and assassination, and who deserve the punishment meted out to such malefactors everywhere. Organized labor has just the same rights as organized capital—in some cases superior rights and privileges—and the drastic measures now in application in the Cœur d'Alene country are not a menace nor an attack, but a protection. The State and Federal authorities are not fighting the Cœur d'Alene Miners' Union as a union or an organization of working men, but as a criminal crew of outlaws who commit dastardly crimes in the belief that the ægis of the Miners' Union will yield immunity from deserved punishment. Those marauders who masquerade as a "Miners' Union" do more damage to respectable organized labor than any of its other enemies possibly could do, and deserve disavowal by any and every labor union, realizing that wrongs cannot be redressed that way and that lawlessness always alienates the sympathy and support of the real "friends of labor," who do not cater to the mob spirit, but plainly tell the men who wantonly destroy life and property that the Molly Maguires were stamped out in Pennsylvania, and that the similar seven years' reign of terror in Shoshone Co., Idaho, must end; that the American spirit must be upheld and American principles must prevail. Much of this mad destruction of property is the bitter fruit of blossoms blown to us from across the seas—the dread result of old-world conditions that should be impossible under our flag. The men who perpetrate such crimes are alien in thought and action; they have no conception of the first principles of American citizenship, nor have they any apparent idea of the cornerstone of American liberty, which is that every man in this country has a right to do as he pleases—*provided* that he does not interfere with any other man's right to do as *he* pleases—a broad proposition and one that applies to encroachments of capital on real workingmen's rights, as well as attacks upon those same rights by any band of men claiming to represent the cause of labor.

Luck vs. Judgment.

The theory that a mine should be worked, or that exploration should be continued throughout an indefinite period, regardless of the results of such operations, is a good one from the standpoint of those who derive a direct pecuniary benefit from such operations, but from the position of those who are furnishing the money to carry on such an expensive enterprise a limit is often found where there is no encouragement in the development. Some veins, at first small and of no great promise, have in the end developed into rich and large-paying mines; and, again, veins which at and near the surface were more than promising on being explored have proved to be practically valueless. How far the element of luck, in the common acceptance of the term, is an important factor in the success of a mine is pretty well determined by the experience of many from among the ranks of both prospectors and capitalists. Almost any man who has any knowledge of mining and business can recognize a valuable mine when it has been developed, but it requires more than ordinary perception to distinguish between one which is really good and one which has the appearance of being good but is not. The annals of mining are full of rich and phenomenal strikes. Instances of good luck in striking a rich ore shoot by a shaft sunk at random, as at the Little Pittsburg mine, on Fryer hill, Leadville, Colo., or the pit sunk on the Mount Morgan mine, in Victoria, are not rare. The rich Hillside mine in Arizona was discovered by a prospector who hesitated for some time whether or not to climb the mountain slope to examine a small red patch of ground or to go home. He decided to climb the hill, regardless of the heat, and found the croppings of the rich vein. A soldier picked up float on the croppings of the Silver King mine in Arizona and could not find it again; a prospector who climbed a white knoll to look around the country for his burro discovered it later. He stood at the apex of an ore shoot which produced millions. Trained mining engineers are apt to be over-cautious, while the prospector and miner who do not feel so heavily the weight of responsibility, and who usually have neither much money nor valuable reputation to lose, are more inclined to take what, in some instances, looks to others like desperate chances. A courage to "stay with it" is laudable in a way, and is always praised if a strike results; but very different words are spoken of the luckless superintendent who wastes the company's money and finds nothing. The greatest ore body and the richest the world has ever known was found by the persistent determination in following a small seam for hundreds of feet until it led to the big bonanza in the Con. Virginia and California mines on the Comstock. Without a risk there is seldom a great gain, and a good prospect is always entitled to an expenditure necessary to prove its real worth. The surface plant should be as inexpensive as it is possible to have it and accomplish its object. If a rich mine is opened the mine will pay for an expensive plant. Put the money underground and follow the ore are good maxims in mining.

THE California Supreme Court decided a case last week that should never have gone to trial in any court. The facts were that in Tuolumne Co., Cal., a mining company prospected and found gold on a tract of land that was held under Government grant as agricultural land. They laid claim to it as mineral land under the mining laws, and, of course, were beaten in the State court of last resort. It ought to be well understood by this time that when a tract of land is held under an agricultural patent, regularly and legally acquired from the Government, that no one has a right to prospect or mine thereon except with the owner's consent. If a contest be brought, it must be before the local Federal officer, and the case goes to the Interior Department. It is a waste of money to institute suit in a State court, because, usually, the proof that the land is held under agricultural patent suffices to throw the case adversely to the miner. About 200 columns appeared in this paper in '94, '95, and '96, in intelligent showing of how this state of affairs could be changed, and success was nearly attained; but an adverse President of the U. S., Speaker of the House, Secretary of the Interior and Commissioner of the General Land Office was too formidable a combination even for the MINING AND SCIENTIFIC PRESS. However, nothing is ever settled till it is settled right; this matter will eventually receive just adjudication; meanwhile, in such cases as the Tuolumne one cited, no miner or mining company has any use in bringing such a suit as that brought by the La Purissima. The greatest surprise is that any lawyer claiming to know anything of mining law should encourage a client to go on to inevitable defeat.

Why Prospectors Want to Sell.

Of mines which pay comparatively few would ever become valuable without the aid of capital, and this primary requisite the claim owner usually lacks. He may have muscle and grit and may be willing to work faithfully to the end, but at best his efforts will develop the mine superficially. Those who are fortunate enough to own a claim so favorably located that the development can be accomplished by means of tunnels have an easier road to fortune than those who must sink a shaft to accomplish the same purpose. In either case cash is necessary for the purchase of tools and supplies. The facility with which a mine may be opened depends wholly upon its situation. Those ideal locations, where the vein may be opened by adits with a thousand feet of backs; where there is an abundance of fine timber to be had for merely cutting it; where a splendid water power is situated at the foot of the hill, and where every ton of ore is rich, are not often found. Good prospects, which have developed into great mines, in many cases have been situated in a region difficult of access, timberless and devoid of water, at least for power, and with every conceivable disadvantage surrounding them. These mines required capital to equip and develop them, and the result has been satisfactory to the investor. The prospector who fortunately finds a vein of ore from which he can ship with profit at once, needs no capital, indeed capital immediately seeks him and endeavors to purchase his claim, usually at a price considerably below what the finder thinks it worth. The other prospector who found a vein of low-grade ore is helpless without financial aid, and realizing his helplessness, while firmly believing in the value of his property, he looks to those having capital to invest in his mine. In consideration of these facts, the question so often put to the prospector, "Why do you wish to sell your mine if it is so good a thing?" is as absurd as it would be to ask the owner of a high-grade property, "Why do you not sell your mine since it is so good?"

THE monthly statements of the leading mines of the Rand in South Africa, which appear elsewhere in this issue, form a fair basis for comparison with large mining and milling operations in the United States. These figures show a very low cost in the treatment of tailings, concentrates and slimes, but the total cost of mining and milling reaches about $5 per ton. This apparently high cost is due to the fact that the mines are deep and the veins relatively small. In the United States there are very few mills containing more than sixty stamps where the veins, the ores of which they crush, are not large—40 to over 100 feet in width.

THE death of several miners and the serious injury of others in a Rossland, B. C., mine last week while running a power drill which struck a "missed hole," shows once more how necessary it is to exercise care after a series of blasts have been discharged. The locality of each hole is known to those who made them and the place should be carefully inspected to determine whether or not all holes were discharged. When a missed hole is struck in drilling, only a miracle can save the men from death or injury.

THERE is reported an unabated demand for copper among domestic manufacturers. The price has advanced slightly. No spot cash Lake copper can be obtained under 18¾ cents. The producers are not forcing sales, and the outlook is good for the price to remain at its present figure, at least not to go below it.

THE State of Nevada is finally realizing that if its few inhabitants would devote less time to politics and more to the development of that State's great mineral resources the outcome would be more financially satisfactory.

Concentrates.

A CUBIC FOOT of platinum weighs 1218.75 pounds.

METALLIC COPPER in bars weighs 542 pounds per square foot.

THE length of a pendulum which will beat seconds, at New York, is 39.10153 inches.

TURPENTINE mixed with black varnish makes an excellent coating for iron smokestacks.

BLUE VITRIOL, bluestone and sulphate of copper are the same thing, by different names.

THE gold output of Nevada for '98 approximates $3,000,000; that of silver about $850,000.

A LARGE area of copper-bearing land is reported to have been discovered in Archer county, Texas.

IF a shaft be divided into two compartments by an air-tight partition it will greatly facilitate ventilation.

IN Wyoming, on the Little Missouri river and elsewhere, are coal beds which have been burning for years.

MOMENTUM in any moving body is its weight multiplied by its velocity in units of distance, as by feet per second.

OLD mill plates over which any considerable quantity of gold has passed are always more valuable than when new.

NEVER clean up an amalgamated plate with a chisel unless the plate is to be melted and sent to the refinery.

WITH a copper hammer a key may be driven as well as with a steel one, and the copper hammer leaves no marks.

SHEET lead makes good gaskets for steam joints. If carefully made they outlast several leather or rubber gaskets.

THE hoisting compartment of shafts should be lined to prevent accident to men riding on cages, skips or buckets.

NO PERSON may enter upon the property of another for the purpose of prospecting without the consent of the owner.

AN element or simple substance is one which can not be resolved into any more simple substance, as oxygen, gold, carbon.

TWENTY miners' inches of water is usually considered a sluice head for sluicing gravel with a fall of about 8 inches to a 12-foot box.

WHEN necessary to cut gaskets from sheet packing, the work is rendered much easier if the knife is dipped frequently into a cup of water.

IN milling gold ore it is desirable to get as large capacity as possible while saving as much gold as possible by simple and inexpensive means.

A REPORT has been received at Nevada City, Cal., that a party of Nevada county, Cal., miners have perished from privation and exposure in Siberia.

ATOMIC WEIGHT is an expression used to denote the amount of a simple substance by weight which will unite with other simple substances to form compounds.

THE dynamo at Kelsey, Cal., was recently destroyed by fire. It was the first electrical mine application in California, and was frequently referred to.

MILL MEN do not agree upon the construction of mortar blocks. There are numerous methods of making these, and a number of ways of putting them in place.

ALL working shafts should be sunk on a uniform line whether vertical or inclined. Prospect shafts should follow the vein no matter which way the dip may change.

THE coinage at the San Francisco Mint for the fiscal year aggregates $63,862,275 — $58,258,000 in gold and $5,604,275 silver—as against $53,820,000 for the previous twelve months.

A CALIFORNIA mining paper of current issue gives two columns to a fight and four lines to the mines in its vicinage, and editorially wonders why capital is slow in investing therein.

STEAM PIPES in shafts, owing to changes in temperature when steam is on or off, are subject to great expansion and contraction, and for this reason should be provided with slip joints.

THE Western Federation of Miners is computed to now number 80,000. It is strongest in Montana, where it originated in '78. There are said to be 11,000 members in that State.

OBJECTIONABLE partners in a mining claim cannot be gotten rid of unless they fail to do or pay for their share of assessment work, when they may be dispossessed by process of law.

THE Yreka, Cal., *Journal* announces the discovery in Siskiyou county of "a tin mine." The ledge is said to be "300 to 400 feet wide." The mine is fittingly located on Little Humbug creek.

THE sizing of pulp as it leaves the amalgamating plates in front of the battery will be found to facilitate the concentration of sulphides, coarser material going to one machine and fine to another.

TO-DAY the Carson, Nev., mint is reduced to an assay office. Efforts are being made to secure authority to make assays and analysis of ores, which is now prohibited at Carson, but allowed at other assay offices.

A STORAGE BATTERY is a cell of acidulated water, into which have been introduced plates of lead. Into this an electric current is directed and stored and which it will give out when required in nearly equal amount.

OF the permits issued to the men at the Standard mine at Wallace, Idaho, last week, all but three of the applicants were native-born Americans. At the time of the strike 80% of the men employed were foreign born.

WHEN trying gauge cocks open them slowly, or you may be deceived. When opened suddenly the relief from pressure sometimes causes water to lift and run out of the cock when the real level is considerably below it.

PURE aluminum is said to possess only 67% of the conductivity of electric currents that copper has, and a very small amount of impurity reduces its conductivity very materially. One per cent impurity reduces the conductivity to 59%.

THE introduction of canvas plants at numerous mines in California has proven their usefulness in almost every instance. Fine slimes are concentrated on these tables from the tailings which have passed over concentrating machines.

ORE BINS in mills and at mines should be of large capacity and should always be kept as full as possible, so that in the event of any difficulty in the mine necessitating a shutdown the ore in surface bins may keep the mill supplied for several days.

A LARGE mine pump was recently disconnected in a Leadville mine, lowered 200 feet, connections made and steam turned in within twenty-four hours. This was done in the face of the danger of being flooded before the work could be completed.

DIVERS are prospecting the bed of the Sacramento river near Redding, Shasta county, Cal. They scoop up the gravel in buckets and it is hauled to the surface, where it is washed. This work is preparatory to putting in a dredge if prospects warrant it.

WHEN a discovery of a mineral vein is made outside of but adjoining an agricultural patent, all rights to the vein stop at the line of the agricultural ground. No extra-lateral rights can be obtained under such conditions beyond the line of the agricultural filing.

BY hard work, those who are not starved on the way nor overcome by the intense heat can pan out $1.50 per day at the San Roque placers in Lower California. Like the Klondike lies, the glittering stories from torrid San Roque are largely in the interest of transportation companies.

IF all the tailings from the Homestake group of mines in South Dakota, which have come from the several mills since the mines were first opened, were piled on a level plain, they would form a cone-shaped pile having a base of not less than 2000 feet diameter and a height of about 600 feet.

A MIXTURE of sulphate of copper (bluestone) one ounce; alum, one-quarter ounce; powdered salt, half teaspoonful; vinegar, one gill and nitric acid, twenty drops, will cut steel too hard to be filed. If applied to bright steel and washed off quickly it gives the surface of the metal a beautiful frosted appearance.

A SUBSTITUTE for galvanizing iron and steel, which consists in the use of a bath composed of zinc, tin and aluminum, produces a coating that is so firmly adherent that the sheets will permit working and will resist corrosion. It is claimed that metal thus treated can be raised to a red heat without injury.

THE grade to give a canvas table built for concentrating slimes is determined by the character of the material, fineness of the sulphides, quantity of quartzose or talcose gangue present and amount of water available. Three-fourths of an inch to the foot is given in some plants with good results.

THEORETICALLY a 1000-pound stamp dropping 6 inches, 100 times per minute, crushes 25% more ore than a stamp of 1000 pounds dropping 16 inches 30 times per minute, all other things being equal. It is claimed for the high slow drop that the character of the ore, where the method is in use in Colorado, demands greater time for amalgamation.

THERE are four idle non-trust smelters at Leadville, Colo., three in Aspen, three in Golden and one at Denver. Where money is made in smelting, where the ore exists and intelligent management can be found outside the trusts, the Colorado smelting situation will doubtless settle itself. Such things usually do, even under the rule of a "benevolent monopoly."

IN designing a quartz mill it should be remembered that the process should be automatic throughout, from the introduction of the ore at the top of the mill to its discharge at the lower floor, and the construction should be arranged with this in view. Always provide abundant dump room for tailings, unless there is a large amount of water at hand to wash them away.

EVERY group of mine and mill buildings should be protected from danger of fire by the location of hydrants at points commanding the various buildings. At some California mines giants such as are in use in hydraulic mines are located at some central point where any of the buildings or timber piles in the yard may be reached with a large stream of water under high head in case of fire.

SNAKE river dredging for gold has not proved an unqualified success. Four dredges are abandoned near Payette, Idaho, from various causes. The one at Bridge Island reports profitable returns. It is a continuous performance, seven men are employed, the average value of the 2000 cubic yards daily treated is claimed to be 12½ cents; 80% of the gold being saved at an expense of 5 cents per yard.

THE eight-hour law contest was fought to a finish in Utah, its constitutionality being finally sustained in the United States Supreme Court. A Denver lawyer who represented organized labor in that fight will represent the smelter men in the test case begun this week in Colorado. The Utah State Constitution contains a clause permitting such State legislation as the eight-hour law. It is understood that the Colorado State Constitution does not explicitly admit of such construction.

TO-DAY goes into effect a reduction of charges at the San Francisco Mint as follows: Bullion containing less than 200 m. gold, from 2 cents to 1⅛ cents; from 200 m. to 399⅛ m. gold, from 3 cents to 2 cents; from 400 m. to 699⅛ m. gold, from 4 cents to 3 cents; from 700 m. and over, from 6 cents to 4 cents; over 100 m. base metal, additional 1 cent; bullion containing less than 897 m. silver, from 2 cents to 1⅛ cents; from 897 m. to 979⅛ m. silver, from 1⅛ cents to 1 cent; from 980 m. to 997⅛ m. silver, from 1 cent to ⅛ cent.

ONE of the modern labor and time-saving additions to gold mills is in the construction of an overhead track in front of the battery line, upon which may be run a traveler carrying an iron bucket. When cleaning up, the grits, et from the mortars are shovelled into this bucket and it is moved along from mortar to mortar and finally to a point above the clean-up barrel, into which it is dumped. It saves much time and keeps the plates from being scratched and indented by shovelling the contents of the mortars upon them.

IN the Cheney coal mine, near Elsinore, Riverside county, California, ventilation was secured by sinking an air shaft from the surface to the workings on the vein, but the shaft being too small to afford the necessary volume of air, a fireplace was constructed underground and a large fire kept burning in it, the coal from the vein being used for fuel. This created sufficient draft to supply the workings with fresh air which entered through the adits.

THERE is much diversity as to the advantage of various positions for the line shaft of a quartz mill. Some believe the line shaft should be extended straight out from the engine or water wheel, on the feeder floor. Others think a short main shaft with belts to a line shaft on the cam floor is superior. The latter affords a better opportunity to make necessary repairs, and has the advantage of more light, and it is always easy to observe anything which may get out of order with the shaft so arranged.

MONTANA'S five mineral commissioners propose to have a fine State exhibit at Paris next year. F. J. N. Skiff of Chicago, who has charge of the American mining exhibit there, says he wants California to send "petroleum, borax, asphaltum, onyx, rich gold ores and gems." A special representative would also be in order. In Colorado the exposition commission is reported to have contracted for a solid gold statue for exhibition: the figure of an American girl, in 18-carat gold, the statue, with its base to be 6 feet 4 inches in height.

THE principle of the long wall method of mining horizontal veins, or those lying at a low angle, consists in taking out all the valuable mineral (coal or ore) in a single operation, maintaining open passageways by building rock walls on either side of the gangway. As the work advances the waste (gob) is thrown behind the miners, and upon this the roof settles. The face is kept open by several lines of props set between the "gob" and the face of mineral. Many of these props may be recovered under ordinary conditions and reused.

THE extracting of gold from its ores by free milling process consists of two operations: the pulverization of the ore to free the gold from its matrix, and amalgamation of the particles of gold with quicksilver. These two processes, simple in themselves, have many modifications in the practice of various districts, the variations being necessitated by the difference in the character of the ores in different regions. Concentration is wholly independent of amalgamation. Some gold ores require no concentration; others can be worked in no other way except smelting.

BULKHEADS and dams constructed in mines to hold water should be built with greatest care, and in such a manner as to resist the greatest possible pressure which they may be called upon to withstand. A channel broad and deep enough to afford secure anchorage should be cut in the floor, roof and sides of the drift where the bulkhead is to be built, which should be provided with a pipe and valve, through which water may escape while the bulkhead is in course of construction. Should a dam break under heavy pressure of a column of water, much damage may result.

DURING the month ending June 30, '99, there were received at this office 5486 issues of different publications, newspapers, magazines, etc. In these were 4462 clippings from the MINING AND SCIENTIFIC PRESS and similar publications. Of the 4462 excerpts, 3289 were from this paper exclusively; the other 1173 were from its contemporaries. That is, the quotations, clippings and selections from the MINING AND SCIENTIFIC PRESS, reprinted in the current literature of the month received, have outnumbered nearly three times those from all other similar journals combined. And this includes only what was credited to this paper.

ADJUSTABLE yokes for the support of steam, air and other pipes in mine shafts may be made by bolting together two pieces of 4x4, or, if necessary, larger dimensions, and boring or cutting out on the center line a hole having a somewhat smaller diameter than that of the pipe. The bolts may be unscrewd, one side taken off and the yoke placed in position in the shaft, the ends resting on the timbers. The bolts should have square heads and each end should be provided with a washer of sufficient size to prevent the bolt head or nut from sinking into the wood when tightened. A yoke of this kind may be changed from one set to another, if occasion requires.

THE word porphyry means purple, and is the name originally applied to the purple colored rock used in Egypt for making monuments, etc. As applied to rocks now, it has only a structural significance. As now understood, porphyry is any rock in which distinct crystals of any mineral occur which are larger than the grains or crystals of the ground mass in which they occur. The ground mass may be very fine in texture or may be quite coarse. A fine-grained, dark-colored rock in which occur white crystals of feldspar is porphyry; a fairly coarse granite in which occur crystals of feldspar an inch or two in length is also porphyry. There is also quartz-porphyry, hornblende-porphyry, feldspar-porphyry, etc. Porphyrite is a name applied to basic rocks having a porphyritic structure, as diabase-porphyrite, diorite-porphyrite, etc.

IN '93 Utah smelters cut wages 10%. When the eight-hour law went into effect arbitration resulted in a restoration of the scale paid before '93, that is, the old standard was resumed, the men being now paid under the present system two-thirds to four-fifths of what they had been paid when working twelve or ten hours per day, respectively. Bingham, Utah, miners are paid from $2.25 to $2.75 per day, according to the wetness of the ground; at Mercur $2.50 is the standard. At the Hanauer, Utah, smelter the present scale is: Day foreman, $144 per month; night foreman, $3.25 a day; master mechanic, $125 per month; engineers, twelve hours' work, $3.15 a day; laborers, eight hours' work, $1.40 a day; crushermen, eight hours, $2.40; boiler and firemen, $1.66; roaster firemen, $1.66; suppliers, $1.50; roaster helpers, $1.50; furnacemen, $2; furnace helpers, $1.50; feeders, $2; blacksmith, ten hours, $4 a day; yardmen, ten hours, $2.25; teamsters, ten hours, $2.25; unloading cars, 20 cents per hour. Up to June 1st, at the Denver, Colo., smelters the twelve hours per day wages for furnacemen were $2.75; tappers, $2.25; other yardmen $1.60.

Cyaniding Slimy Ores and Tailings.

Written for the MINING AND SCIENTIC PRESS by MATT. W. ALDERSON.

Part V.—Refining, Etc.

The gold slimes produced in the United States nearly all find their way to refineries for final treatment. With the exception of the cyanide mill at Cyanide, Colo., where the precipitates are roasted, fluxed and melted direct into bullion, there is practically no system of home treatment in extensive use but the method of reduction by sulphuric acid. This, it has always seemed to me, possesses many disadvantages. In the first place, sulphuric acid will not dissolve all the zinc, and, after pretending to cut it, a considerable portion of the zinc, as well as the sulphur, must still be gotten rid of by roasting and fluxing. A second serious objection with the product of most ores is that, even after the bullion is supposed to be refined, it is not refined, but must still find its way to the refinery, the U. S. assay offices refusing to purchase bullion of a fineness of less than 500 in gold.

After experiments with sulphuric and hydrochloric acids, the writer abandoned both in favor of nitric acid. The zinc and silver can both be dissolved with this acid. The acid is poured direct on the wet cyanides, fresh from the extractor, and sufficient water is added from time to time with the acid to carry the dissolved zinc in solution. After a little experience, it is easy to tell when the zinc has been dissolved, as it settles compactly on the bottom of the vessel after stirring until it is dissolved; or samples can be taken out and tested in a beaker from time to time. Almost every particle of silver can be dissolved, after which the acid is decanted into another vessel and the residual gold washed again and again with water until no trace of zinc or silver shows in the solution, if one wishes to carry the refining so far. The silver in the dissolving fluid and washes is then precipitated by the aid of common salt and recovered as silver chloride. The brown-colored gold paste is dried, fluxed principally with borax, melted and cast into bricks. By this method, practically the same as that employed for refining gold at the U. S. Mint at Philadelphia, one actually refines his product and has his gold and silver in separate bricks. The gold produced is marketable anywhere, and, by running one's own test of its fineness, it is easy to determine its actual value.

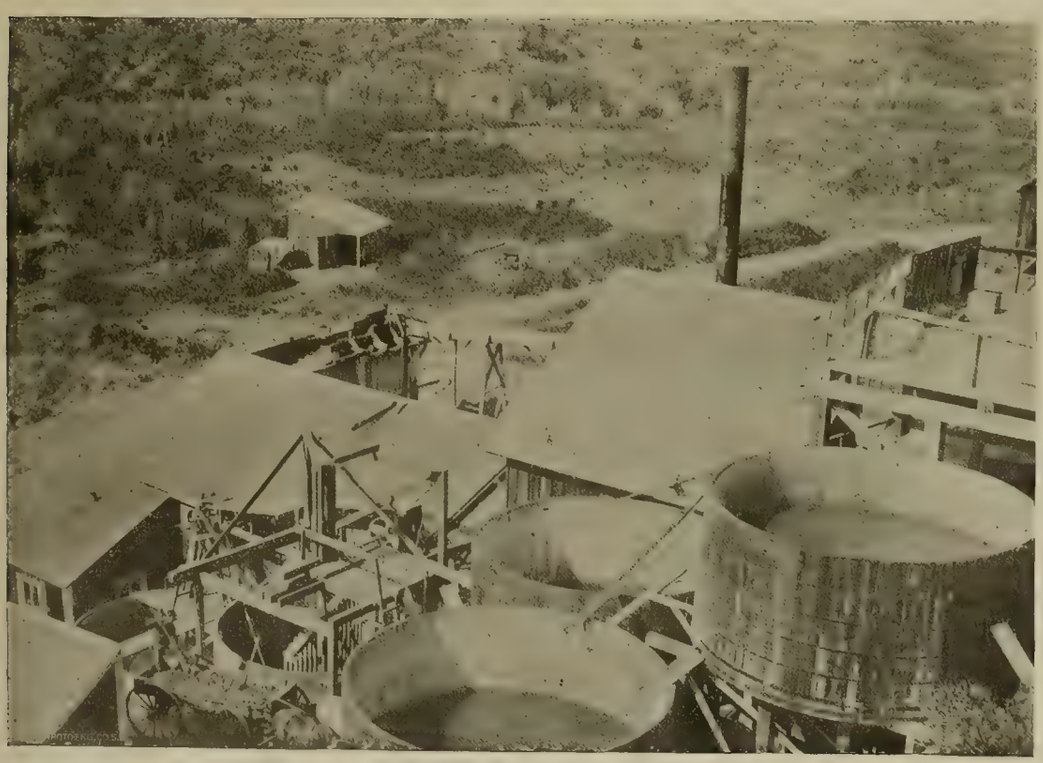

FIG. 7.—MOHEGAN CYANIDE MILL, RED BLUFF, MONTANA.

Fig. 7 is an illustration of the Mohegan mill at Red Bluff, Mont., mention of which has been made in previous issues of the MINING AND SCIENTIFIC PRESS. The agitator is so arranged as to treat tailings or take the pulp as it comes from a 10-stamp battery. All such a plant needs is an abundance of good ore. It handles the material expeditiously and economically.

If details of the system in use here and at other slimes plants in Montana seem lacking in the present article, the reader may find them in a previous contribution ("Aids to the Cyanider," MINING AND SCIENTIFIC PRESS, Oct. 15th, '98). Perfection is not claimed. Good work has been done with material not successfully handled heretofore. At the same time, in the light of past experience, better work can be done to-day. Most good things do not spring up like mushrooms, but are the outgrowth of the experiences of years and of many persons. Most of us may forget to recognize at times that the present skill in treating base ores is the accumulated skill of ages. Slimy ores and tailings are handled as successfully to-day as any other class of material, and the field for work of this character is much broader than many people imagine. There are ores, such as those at Mercur, where a splendid extraction can be secured with coarse crushing. This is an exceptional, rather than a typical, ore of the Rocky mountain region. The ores at the Republic mine, in Washington, need crushing to an impalpable powder before they will yield their values to a solvent. Roasting is essential with many ores, and roasting and fine grinding may be necessary with others before they can be compelled to surrender their precious contents. Even concentration after leaching has been found necessary in Colorado and Montana.

Very marked improvements in treating refractory ores have been made the past few years and the end is not yet. Marked as has been the improvements in handling slimy material, those most in touch with the work can see where changes for the better will soon be made, enabling a more perfect extraction to be secured at still less cost. The writer is of the opinion that the time is not far distant when a number of ores now concentrated will be cyanided. Why concentrate and then treat the concentrates and tailings separately when they both may be treated at once? With conditions right, which comes of course from a careful study of the particular ore and the fitting of the process to it, lixiviation will be the lone competitor of smelting for certain classes of material; for by one or the other of these two only, can an extraction approaching perfection be obtained, and the advantages of economy are decidedly in favor of the liquid process.

In Montana to-day are no less than twenty cyanide mills in successful operation, ranging in capacity from 400 tons a day down. Eugene B. Braden, of the U. S. assay office at Helena, who compiles the record of the mineral output of the State, says in his report for '98:

"The yield of gold from the cyanide plants is an interesting feature of the production. From a small beginning, a few years ago, this product continued unimportant till '97, when it suddenly increased to about 10,000 ounces. This was nearly doubled in '98, and a constant growth for a number of years is anticipated."

No higher compliment can be paid any process than a record of good results. They speak with an emphasis that counts. And as a part of the excellent work that is being done with cyanide in Montana it can be said of the slimes plants that they are keeping up with the procession. At the close of '99 they will come to the front with a record of more than twice the production of the year previous.

Nearly all the works on cyaniding give as their greatest objection to an agitation system that power is required. Thus, one author estimates that 1 H. P. per ton will be needed, and the latest work says: "It requires motive power, which in itself is a source of considerable expense. * * * * Agitation is only adapted to impermeable material of high grade or to concentrates, where the extraction is sufficiently good to justify the additional expense entailed by use of motive power, etc." ("Practical Notes on the Cyanide Process," Bosqui.) While these remarks may apply to some early efforts, they do not apply to agitation as practiced in Montana. No cyanide plant is complete without power to run a zinc lathe and a solution pump, and that same power would run two agitators. Ten to fifteen H. P. would be ample for an agitation plant treating fifty to eighty tons of tailings a day, and this expense for power is easily offset by the saving over percolation in the one item of discharging the material after treatment, even where, as in the latter case, it is sluiced out of the leaching vats.

(CONCLUDED.)

A Method of Arranging Mine Samples.

TO THE EDITOR:—In a paper by Geo. J. Bancroft, entitled "Notes on Mine Sampling," which appeared in the issue of the MINING AND SCIENTIFIC PRESS of June 17th, that gentleman suggests a method of averaging mine samples, based upon the relation of the number of feet sampled to the value per ton as determined by the assay of the sample. He multiplies the number of feet represented in the sample by the number of ounces per ton as shown by assay, and calls this product the "foot-ounce." Mr. Bancroft says: "The sum of all the values in foot-ounces is then taken and the sum of all the widths in feet. Both sums are divided by the number of samples, giving the average value in foot-ounces and the average width in feet. The average value in foot-ounces is divided by the average width in feet, giving the average value in ounces."

This method is perfectly correct, but in many mining regions the value of ore is calculated in the more common commercial terms of dollars and cents, and the quantities are measured or estimated by tons. In a region of large low-grade mines, the system of Mr. Bancroft would also apply, but it would involve generally the employment of fractional quantities, which, while not particularly confusing or beyond mathematical computation, are unnecessary, if the tons and dollars method be employed. The matter of averaging samples can be simplified greatly if the number of feet are assumed to represent tons, as ore going to the mill or smelter is calculated by the ton, and not by the foot. Multiply the number of feet, or fraction of a foot, by the assay value in dollars and cents per ton, and let the product represent the value of a number of tons equal to the number of feet in the sample.

Taking Mr. Bancroft's three samples for the purpose of illustration: Twelve feet of one-ounce ore, 1 foot of twelve-ounce ore, and 6 feet of three-ounce ore. Assuming, as above suggested, that the feet represent tons and the ounces be reduced to dollars at $20 per ounce, we have:

12 tons of ore, worth $20 per ton	$240
1 ton of ore, worth $240 per ton	240
6 tons of ore, worth $60 per ton	360
19	$840

This shows an average value of that portion of the mine sampled of $44.21 per ton, obtained by dividing $840, the total value of all samples, by 19, the total width in feet representing tons. By this method we reach exactly the same result as that obtained by Mr. Bancroft's method in a more simple way and with an expense of much less time and computation, and the result is in a tangible form, which suggests to the mind whether or not the operation of the mine will result in profit or loss.

MINING ENGINEER.

San Francisco, Cal., June 24th, '99.

A SCHEME for damming the Ottawa river at Mechanicsville is receiving considerable attention. It is proposed to build a dam at this point high enough to do away with the Remoux rapids. By so doing the anchor ice, which has given so much trouble to the Ottawa power houses in recent years, would be avoided, and incidentally a 40,000 H. P. would be established. Of this power, 20,000 H. P. will be on the Ontario side of the river and 20,000 on the Quebec side. This power would be utilized by digging a canal parallel to the shore, the power houses to be situated on the piece of land between this canal and the river, with the flumes emptying back into the river. When this projected enterprise is completed and the enormous power obtained, it will give Ottawa probably the largest amount of water power of any city in America outside of Niagara.—Electricity.

Peculiar Effect of Subterranean Corrasion of Rocks.

Written for the MINING AND SCIENTIFIC PRESS.

A more strange appearing region than that about Columbia, Springfield and Shaw's Flat, in Tuolumne county, Cal., would be difficult to find. To the passer-by it presents the appearance of a broad field of what seem to be strangely shaped boulders of limestone thickly strewn over the entire valley, and suggests a vast graveyard in which there are thousands of odd-looking tombstones sacred to the memory of the past.

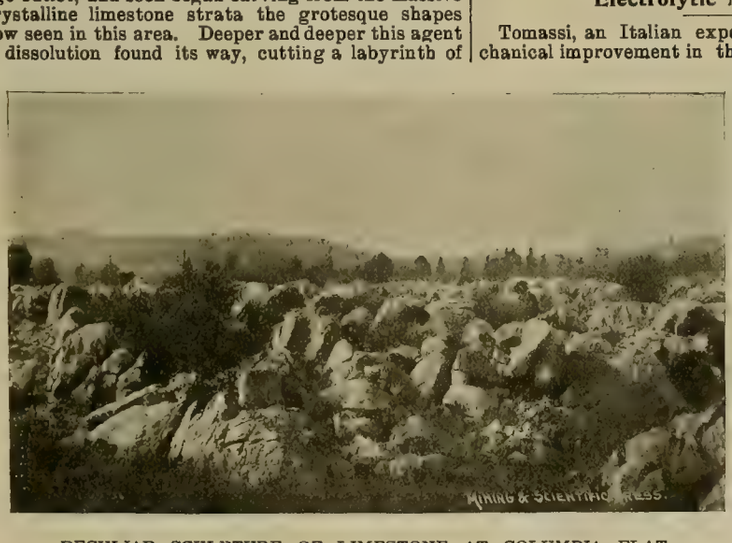
These peculiarly jagged boulder-like masses owe their present appearance almost wholly to the dissolution of the more soluble or readily attacked portions of the limestone formation by acidulated waters percolating through the alluvial deposits which formerly overlaid the limestone, and form a typical illustration of subterranean dissolution of rocks in contradistinction to erosion in its ordinary sense.

The geological history of the region, if it could be written in detail, would form a most interesting chapter, but at this time only its general conditions can be stated. It is evident that at one time the hills surrounding the valley and also the valley itself were higher than now. On the western side of the valley is the Table mountain gravel channel, which for the past fifty years has been illustrated in all geological text books as the typical form of ancient river channel in California, filled with gold-bearing gravel and overlain by a thick flow of black feldspar-basalt. When this channel was formed it must have been confined by hills rising on either side. Down the valley itself near Columbia was another gold-bearing channel which has the appearance of being older than the Table mountain channel. Immediately above the gravel was deposited a heavy flow of rhyolite tuff. What material overlaid the tuff can only be reasoned by analogy. In Calaveras county gravel channels of similar character and overlaid by rhyolite tuff have a capping of brecciated andesite cemented by volcanic mud. This capping has been entirely removed in the neighborhood of Columbia, and only a portion of the tuff remains.

There may possibly have been other channels crossing the basin, but subsequent erosion has removed all but a few remnants of the gold-bearing streams, and their golden contents have been scattered over the greater portion of the surface of the limestone which forms the larger portion of the floor of the valley.

When gold was discovered on Columbia Flat in '50 it was a broad, beautiful, park-like tract dotted with magnificent oaks and other trees. In spring the meadows were bright with the hues of California's native flora. The soil was rich and the growth of vegetation luxuriant. For centuries the seasons following each other had seen this vegetation come into life with each succeeding spring and seen it die and decay on the damp meadow. The carbonic acid generated by this decay of organic matter was taken up by the water which percolated over and among the rocks, seeking a natural drainage outlet, and soon began carving from the massive crystalline limestone strata the grotesque shapes now seen in this area. Deeper and deeper this agent of dissolution found its way, cutting a labyrinth of passages and tunnels, sometimes completely segregating masses from the main formation, these then becoming detached boulders. All this fantastic sculpturing of the rocks took place beneath the surface soil of the valley. The limestone, where exposed to atmospheric agencies, endures better than some of the eruptive rocks which traverse it. Dykes of diorite are seen in many places.

When the miner first arrived in this valley there was little in its picturesque appearance to suggest that beneath the fertile, loamy soil lay millions in gold; but the industrious pioneers were not long in finding it out and a town of 15,000 people quickly came into life. The beautiful, park-like valley soon became a mass of unsightly heaps of boulders scattered among the 10,000 tombstones, with ditches of muddy water running in every direction.



The work of the miners has afforded an opportunity for further study of the peculiar result of the subterranean dissolution of the lime rocks. As the more soluble portions were removed, the surface detritus evidently slowly sank deeper and deeper, the surface level being maintained by the contemporaneous filling in of material from the surrounding hills. The siliceous and clayey portions of the limestone, being insoluble, have remained nearly in their original relative position and have formed a peculiarly tough, compact, greenish-colored clay layer interposed between the gravel above and the limestone formation below. It everywhere coats the boulders and gravel of the lower portion of the deposit with a shining film, and constitutes a large part of the material found within 5 to 10 feet of the bedrock, though generally found to contain more or less of the gravel wash and sometimes gold.

The irregular manner in which the dissolution of the rock progressed resulted in the formation of hundreds of "potholes," in which gold has been found in more or less abundance, and it is claimed that some of the holes were too deep and the quantity of water encountered too great to permit their being bottomed; and these still contain gold, in what amount is a question.

This process of dissolution of the limestone resulted in the removal of a very large amount of material, possibly an average thickness of 50 feet or more over an area of more than a mile square. Naturally it would be expected that the carbonate of lime in solution would be redeposited at the first favorable opportunity, and such seems to have been the case; for, near Gold Spring, two miles northwest of Columbia Flat, on the upper portion of the slope of the canyon of the Stanislaus river, is found an extensive deposit of calcareous travertine, having a maximum thickness of more than 200 feet and covering several hundred acres in extent. It is clearly evident that this was derived from Columbia Flat and is merely a remnant of the original deposit, the greater portion having been removed by recent erosion.

It has been asserted by some, and believed by many, that a rich channel lies underneath the limestone of Columbia Flat; but this is not so. The only channels now remaining on the flat are those which may be traced by their remnants which appear on various portions of the field. These channels have been much disturbed, and are found faulted and tilted by dynamic forces.

Since the removal of the detritus by the miners many dykes of diorite are seen traversing the limestone. Where exposed to the weather, the dykes have suffered from decomposition and are worn by atmospheric agencies to the level of the limestone; but where these dykes have been protected by the superficial deposit of debris, they have proved more durable than the limestone and stand like walls above the level of the latter. W. H. S.

PECULIAR SCULPTURE OF LIMESTONE AT COLUMBIA FLAT, TUOLUMNE COUNTY, CAL.

Electrolytic Metallurgy.

Tomassi, an Italian expert, has proposed a mechanical improvement in the operation of the electrolytic bath used for the extraction, separation and refining of metals which may prove to be of practical value. The aim of the inventor, says the *Journal of the Franklin Institute*, is to reduce the resistance in the electrolytic cell, and thereby reduce the cost. His electrolyzer consists of a rectangular tank in which are placed two anodes, between which is placed a circular metallic disk mounted on a gun-metal spindle, and capable of being rotated. The disk is partly out and partly in the bath, and so comes in contact with the air and the electrolyte. The part of the disk outside the electrolyte comes in contact with two scrapers—one on each side—which scrape off the spongy deposit and depolarize the surface. The anodes are either in the form of plates or in receptacles containing coarse powder. When the cathode has a sufficiently thick layer of metal it is taken to a bath of molten metal similar to that deposited, and the electrolytic deposit is melted in the bath, and then the cathode is taken back to the electrolyzer. Mr. Tomassi claims that polarization is entirely done away with, that the metal deposited is removed as the deposition proceeds and that the density of the liquids is the same.

Some Experiences of a Working Miner.

NUMBER XXII.

Written for the MINING AND SCIENTIFIC PRESS.

Several years ago the G—— brothers located the D—— mine, and, finding some rich ore, became excited over their discovery. The ore occurred in a broad zone on top of a hill about 400 feet high. It could be followed without difficulty along its strike quite a distance either way from point of discovery. To the southward the hill sloped steeply off to the creek below, and here a tunnel might have been started and driven directly in on the vein. This sensible thing they did not do, but started and drove a crosscut tunnel from a neighboring gulch through 450 feet of hard, pyritiferous slate, along the sides and roof of which the marks of the drill holes could be seen almost every foot of the way. It was a hard and expensive job, worth at least $10,000, and the tunnel never reached the vein at all, as their money and patience gave out. Had they started the tunnel on the vein, they would have had the advantage of a lower level, easier ground and been in the mineral zone all the way. The principal reason for starting the tunnel where they did was that it was more convenient to their cabin.

* * *

The D—— mine was not the most simple proposition I ever heard of. The vein was large, low grade and extremely base. The ores were oxidized to only shallow depth and the sulphides presented as complex a composition as the most ardent searcher for base ores, upon which to experiment, could wish. The gangue was massive quartz, in which occurred lead, zinc, iron, copper and antimony sulphides, and also arsenical compounds of several kinds. The values were chiefly in silver, but, as above stated, low grade. The sulphides constituted 5% to 10% of the ore body. How to treat this complex metallurgical problem was a puzzle. Milling was tried without satisfactory result. The ore was roasted and milled. This was somewhat better, but too expensive. Smelting was suggested and a quantity shipped to a distant reduction works, which returned a bill considerably in excess of results, with instructions to send no more such ore to their works. About this time appeared a splendid invention with a German name. It was a smelter, but wholly unlike the common water-jacket affair which has a limited range of application. This new device embodied so many novel and sensible features as to appeal immediately to the common sense of any person—who knew nothing about smelting. This furnace was guaranteed to successfully smelt any ore containing 2½% lead with a minimum of fuel. Not only this, but it had an attachment that at once solved the vexing problem of economical separation of the various metals. This device was of such a character that the various metals in the ore would segregate to themselves. When the furnace was tapped, the molten metal would discharge into a pot, which, when filled, was wheeled to one side and allowed to cool, while another pot took its place at the furnace tap. On cooling, the pot would be overturned and a cone of metal would drop out. A few light taps with a hammer would separate the several metals, which would be found arranged in a series of layers, the gold at the apex of the cone—a beautiful mass of crystallized yellow metal; then would come in the order of their specific gravity the several other metals, as lead, silver, copper, antimony, arsenic, etc. Here was a solution of the troublesome problem, and, without further trial or even investigation, a furnace with gravity separator was purchased and set up at the mine. The furnace was blown in, and for an hour or two all was lovely, and then the antimony, arsenic, zinc, etc., manifested their disapproval of the operation and froze up the charge so hard that it had to be blasted out. No one has since had the courage to work the D—— mine and the furnace stands rusting in the weather.

* * *

When the original discoverers of the H—— mine had performed some development work on their property they needed a little assistance, and accordingly went to a merchant at D—— and offered to exchange an interest in their mine for a small amount of provisions. After some discussion, Mr. Y——, the merchant, decided to accept their proposition, and, later visiting the mine, he concluded to start some work at a new place on his own account. He employed some miners and ran a tunnel into the hill on the vein, developing a promising portion of the mine. Shortly after this a company offered to buy the property at a certain price and what at that time seemed a large figure. Mr. Y——, not being satisfied with his share of the total sum, refused to sell, demanding a higher figure. Argument was useless; he maintained his position, and called attention to the fact that he had exposed the most promising portion of the mine at his own expense, and thought he should receive some reward for his individual enterprise. At length he made a proposition to the company which was somewhat unique in a mining deal. He proposed to haul away the ore on the dump that he had had taken out at his own expense, and to con-

tinue mining and hauling from the same place for a period of twenty days; at the expiration of twenty days he would transfer his interest to the company at the price offered by them. This was agreed to, and before nightfall Mr. Y—— had every custom mill in L—— and the neighboring gulches chartered to crush ore for twenty days to their fullest capacity. All the available teams were hired and a crew of miners put to work—not in the tunnel, as the company had supposed would be done, thereby still further developing the mine. No; Mr. Y—— started a wide open cut and breasted into the hill on a fine body of ore, and as no stipulation had been made as to how much he should mine or as to how much he should take, the agents of the company could only watch the progress of operations with interest. At the end of twenty days the company promptly shut off Mr. Y—— and tendered the price agreed upon, which was accepted by the merchant with even greater reluctance than he had felt when they first offered it. As a result of his twenty days' privilege, he netted nearly as much as the company paid him, and this under the heaviest expense.

* * *

When I first visited the S—— mine my attention was called by Superintendent C—— to a fissure on which he had drifted several hundred feet. The fissure was one of the most interesting and peculiar fractures I had ever seen in any mine. It was about 2 feet wide, had smooth, regular walls, the space between being filled with crushed rock of the same description as the walls. These fragments were all angular, and varied in size from that of peas to pieces larger than one's fist. They were loosely cemented with fine material of the same rock, the result of finer crushing. Not an ounce of ore was visible throughout the entire length of the drift. When at last the face was reached the superintendent jabbed his candlestick into the crushed rock, sat drown on a projecting ledge and abruptly asked:

"Wouldn't you have run this drift had you been bossing this mine?"

My reply was as abrupt as his question:

"No; I would not."

"Why not?" he asked.

"Because there's nothing in the entire length of it," I answered.

"Yes," said he, "but you would not have known that if the drift had not been run."

"Oh, yes I would," I retorted. "This fissure is a cross fracture of comparatively recent formation. It has never been subjected to the influences of mineral solutions ascending from great depth—the solutions which form ore bodies and fill veins. Had this fissure been in existence at such a time I can imagine that it might have become a vein, and possibly a rich one, but there is not the slightest evidence of ore deposition throughout its entire length."

C—— looked at me steadily while I was speaking, and then said:

"I got h—— for running this drift."

I should think he might. MINER.

Aluminum Feed Wires for an Electric Road.

Owing to the success of the aluminum lines at Niagara Falls, and Snoqualmie Falls on the Pacific coast, the Chicago Northwestern Elevated Railway Co. has placed an order with the Pittsburg Reduction Co. for 150,000 pounds of aluminum, to be used as feed wires on that road. Three sizes of aluminum cable will be used, the largest being about 1½ inches in diameter. The order calls for over ten miles each of the two larger sizes. The feeders will be placed in a wooden box or trough covered by the board walk between the tracks of the elevated and will be supported on vitrified clay blocks, about 9 feet apart and designed with an umbrella drip. A special malleable iron chair will be used every 100 feet, the cable being carried in split-spool insulators to hold the slack. It is estimated that the aluminum will be cheaper, as forty-seven pounds of aluminum wire will answer the same purposes as 100 pounds of copper wire. This installation was caused partly by the rising price of copper and will be the first electric road in the country that has attempted the use of aluminum for feed wires.—The Engineer.

Portland Cement Made From Slag.

Portland cement from iron slag has been so profitably and successfully produced from the refuse at the Sparrow's Point Works in Maryland, and at the works of the Illinois Steel Co., that a plant is to be established at Birmingham, Ala. The supply of slag will be drawn from the Emsley furnaces of the Tennessee Coal & Iron Co., the plan being to have an initial capacity of 1000 barrels a day. Machinery has been ordered for the plant, which will be in working order, it is expected, in about four months. This utilization of what was heretofore a useless by-product of pig iron works is one that promises to add largely to the profits of the iron makers, even though the production of the cement, as in this Birmingham case, is turned over to an independent company.—Boston Transcript.

Gold Production of the World.

The gold production for 1899 is estimated at $340,000,000. The returns for the first four months of this year shows that the ratio of increased production continues and will add $50,000,000 to the production of 1898, which was $290,000,000, bringing the 1899 production up to $340,000,000.

The increase in Africa alone, if maintained the rest of the year, will make the output of the country $26,000,000 more than it was in 1898. The period of thirty years (1861–1890) the average annual production in the world was very evenly maintained at $115,000,000, never running below $90,000,000, nor above $130,000,000.

For the seven years (1893–1899) the annual average was double that, or $230,000,000, increasing from $157,000,000 in 1893 to $340,000,000 in 1899.

Mint Director Roberts estimated that in 1897, 25% of the production went into manufactures and arts; 75% of the estimated production of 1899 at the same ratio will supply for monetary uses this year $255,000,000. This annual production, simply maintained without increase for nine years and added to the actual addition made to the monetary gold since 1893, will make the monetary gold in the world in 1907 double what it was in 1893.

The average annual production for the 150 years ending in 1850 was $13,666,000, and for the following ten years $133,000,000, or ten times the old average. New fields were found then. Now new fields and new treatment for immense bodies of ore have been found.

In the report of the Mint for 1898, Director Roberts says: "There is the best of reasons for believing that this increased production is permanent, in the sense of being probable for years. The recent increase has come from discoveries in methods of reducing ores. The known deposits of these ores, which formerly defied treatment, but which must now yield up their treasures, give assurance that the present rate of production is not likely to soon decline. On the other hand, gold production under these conditions has, in great fields lately unknown, assumed the character of a staple manufacturing industry, and capital is available for it in sums which promise unexampled development in the future."

No attempt is made to indicate the tremendous probabilities of this inflation, without precedent in human experience, but it should be noted that the United States is getting its share of gold.

Director Roberts states the stock of gold in the United States is estimated to have been on July 1, 1897, $696,000,000; on Nov. 1, 1898, $915,100,000, making the gain $228,800,000 in sixteen months. This is a gain of $3,333,000 a week.

Luminosity of a Nernst Lamp is Deceptive.

A singular property of the Nernst lamp, that is not alluded to in Mr. Swinburne's recently published paper describing it, is pointed out by T. J. Johnston of Schenectady. Mr. Johnston says that its candle-power is, to use his own words, "enough to deceive the very elect. Persons looking at it and at its apparent illuminating power upon the walls of a room, etc., have made the wildest and most extravagant guesses at the photometer reading. I know that," he continues, "although I have had considerable experience with the photometer, both in gas and electric lighting work, I guessed fifteen candle-power when the Nernst lamp was giving three. I heard one man, of more experience than myself, guess thirty-two candle-power when the photometer was reading five. And another thought it was eight candles when the reading was only three-fourths of one candle-power. Why this is so, I cannot pretend to say."

UNITED STATES CONSUL MCCOOK, writing from Dawson City, says of the difficulties which miners have to overcome in that Arctic region: "The principal drawback is the crude way of mining the frozen ground, as it is necessary to build fires to thaw it out and then wait till summer before it can be sluiced. This requires time. The price of labor in this country is on an average $1 per hour and the cost of living is exorbitant, every necessity of life costing at least five times as much as in the outside world. In addition to all this is the 10% royalty, which must be paid to the Government on the gross output. A claim in the Klondike must therefore be very rich to yield a profit."

ASSUMING the diameter of the earth to be 8000 miles and the thickness of the solid crust to be 200 miles, the crust then represents but one-fortieth part of the earth's diameter. A hollow sphere 40 inches in diameter, representing the earth, would have but 1 inch of shell to represent the earth's crust and the deepest ocean would be represented by an ordinary coat of paint, or varnish; the highest mountain chain would be a mere wrinkle on the surface scarcely noticeable, and the deepest mine an infinitesimally small pinhole one-two-hundredth of an inch in depth.

Not a Menace to Non-Interfering Travelers.

"Is the Blue Lakes power line a menace to travelers who may chance to touch the wires connecting with the ground?"

F. A. C. Perrine, the chief engineer of the Blue Lakes, Cal., Power Co., answers the question as follows:

"Referring to the inquiry regarding possible danger to persons living near or traveling along our pole line leading from the plant near the Big Bar bridge on the Mokelumne river to Stockton Cal., I beg to call attention to the following facts as regards its construction and to the immunity from danger to passers-by afforded by the type of construction we have adopted:

"The top wire of all is a barbed wire, stapled to the top of the poles and connected at every fourth pole to the ground plates under the pole itself by a small galvanized wire. The wire and its ground plates are for the purpose of protecting the poles and lines from lightning disturbance, and amount to a continuous lightning rod forty-three miles in length. The four wires on the crossarms, supported by large glass insulators immediately below this lightning guard, are the power wires and carry a current of 25,000 volts. This pressure is dangerous, and the probabilities are that any contact with these wires would be fatal. But no one can come into contact with these wires without deliberate intent; and as they are the only dangerous wires on the pole line, it is hard to see how anyone can be injured except when purposely subjecting himself to risk.

"Below the power wires is a crossarm on which telephone wires are suspended, which do not differ from other telephone circuits.

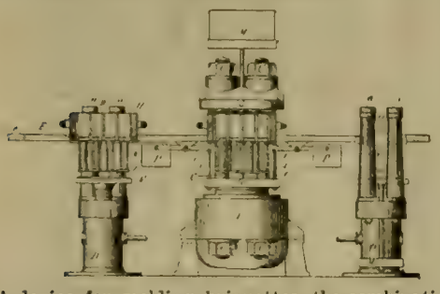
"There remains only to speak of the guy wires which are attached to the polehead and run into the ground, taking up part of the strain at corners in the line. The manner in which these wires are fastened into the ground insures their being safe at all times, since even should they become charged, which we consider impossible, they would immediately conduct the current to earth, and installed as they are, they are no more a source of danger than are the tracks in an electric railroad system. The same observation applies to the grounded barbed wire described above.

"It is necessary, however, to point out that any malicious injury to the line or insulators endangers the lives of our operatives, who must always take some risk in making repairs, and it is difficult to see much difference between deliberate shooting at these insulators or other injury to the line and an equally deliberate act of murder, since such mischief may at any time result in a fatal accident."

Wire Wound Flywheels.

In view of the attention that has, of late, been devoted to accidents from the bursting of flywheels, and the various designs that have been proposed to prevent them, it seems a bit strange that only passing notice should have been given to wire-wound rims for such wheels. Several wheels of this character have been turned out and have been at work with good results for a sufficiently long time to take them beyond the purely experimental stage, but still they have remained isolated examples of a possibly excellent type. Cost of construction may have something to do with this, for their cost was, in all likelihood, comparatively high. But if they thoroughly accomplish the attainment of safety, as they seem to have done, they represent an investment quite as profitable as any that might be made with the saving in cost of a wheel of ordinary construction and the usual uncertainties of behavior. What a flywheel rupture is capable of doing in the wrecking of its surroundings has been shown by a long list of costly accidents. The wire wound flywheels that have been used thus far have been of the homemade variety; that is to say, they have been made by their users, and none, so far as is known, have been offered for general service, so that possibly one additional reason why there are so few of them may be lack of advertising and lack of information, to any appreciable extent, of their good points.—Cassier's Magazine for July.

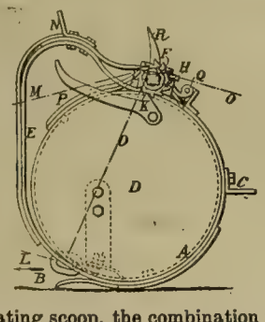
Large Dividend Payers.



It is said that the largest dividend payer excepting one among the mining companies in America and probably in the world last year was the Calumet & Hecla, which distributed among its stockholders during the year $7,000,000. This amount is exceeded by the De Beers consolidated mines, which paid in dividends last year a total of $7,687,300. In addition to this the latter company paid $862,500 as interest on its bebentures and $642,400 for retiring a portion of its bonded debt, making a total of $1,504,400, bringing the total payments in the nature of profits to $9,192,200, or $2,192,200 more than the Calumet & Hecla. The proportion of profits to the capital stock of the De Beers Co. was 40% when that of the Calumet & Hecla was 280%, the capital stock of the latter being rather small.

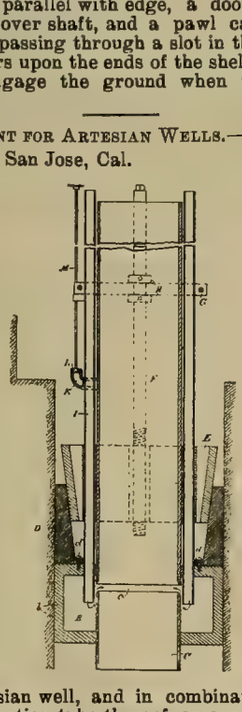
Latest Mining and Metallurgical Patents.

Patents Issued June 20, 1899.



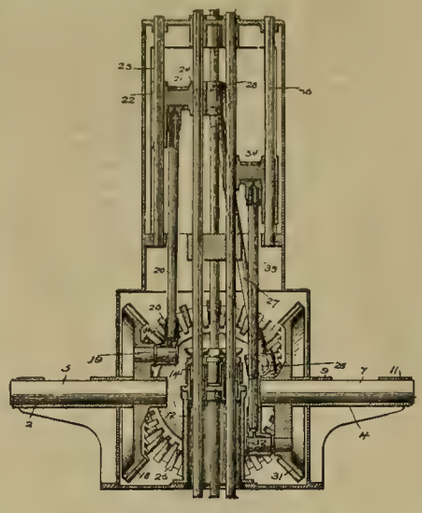
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR MAKING BRIQUETTES.—No. 627,130; F. J. Muller, Bubna, Austria-Hungary.



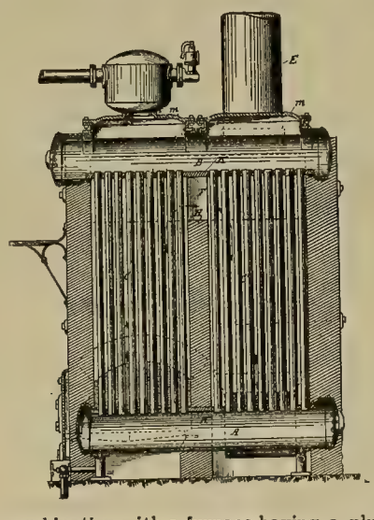
A device for molding briquettes, the combination with the mold *H*, plungers *K* below the same, the press head plate *G*, and the weights *P* for pressing the mold *H* against the head *G*. A mold having depending plungers, a molding press having the head plate *G* and press head *Q*, the weights *P*, supporting levers *f* abutting against mold, and connections between press head *Q* and levers *f*. The combination with a mold, the supporting standards *C*, the press head plate *G*, a press head *Q*, an ejecting plate *N*, the standards or uprights *D* having the fingers *a*, *a'* thereon, arranged above ejecting plate, and the mold supporting tracks *E*, *E*, connecting standards *D*, *D*, and *C*, *C*.

EXCAVATING SCOOP.—No. 627,387; J. E. Brown, Alton, Eng.



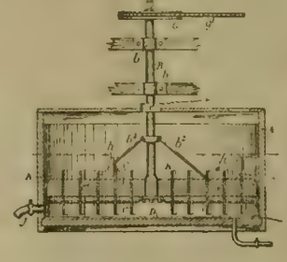
An excavating scoop, the combination with an approximately semi-cylindrical shell having sledge runners at its ends, of a shaft external to the shell but parallel with its axis, draft chains extending from a common shackle to connections at the ends of the shell near its digging edge, ropes diverging from the common shackle to worm bosses on the external shaft, and a ratchet and pawl to hold the shaft at any point to which it is turned, the pawl having a handle by which it may be disengaged. The shell open on one side and provided with an outwardly curved digging edge, of a shaft external to the shell and parallel with edge, a door hinged on shell to close over shaft, and a pawl catch pivoted on shaft and passing through a slot in the door. The sledge runners upon the ends of the shell having projections to engage the ground when the scoop is emptied.

ATTACHMENT FOR ARTESIAN WELLS.—No. 627,250; F. Cavallaro, San Jose, Cal.



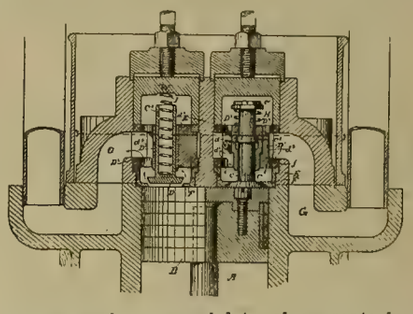
In an artesian well, and in combination with the casing and suction tube thereof, an annular chamber surrounding the lower end of the suction tube fitting loosely within the casing, an expansible gasket fixed to the upper surface of the chamber and an expanding cone with means whereby it may be depressed into the gasket to expand it and make a tight joint within the casing or removed therefrom, of an annular chamber loosely fitting within the well casing, a suction pipe, to the lower end of which the annular chamber is secured, an expansible gasket and means by which it is secured upon the top of the chamber, a movable cone by which the gasket is expanded to make a tight joint between itself and casing, air tubes extending down into the interior of the casing and perforations made through the sides of the casing and connecting with the casing whereby air is admitted into the interior of the suction tube, pipes through which air under pressure may be forced into the interior of the chamber and discharged thence into the suction tube, a gasket fixed to the top of the chamber, and an expanding device whereby a tight joint is made between the gasket and the interior of the casing, and a valve-controlled elbow pipe opening through the side of the suction pipe to admit water from the outside.

TRIPLE PISTON DEEP WELL PUMP.—No. 627,315; W. C. Woodward, Los Angeles, Cal.



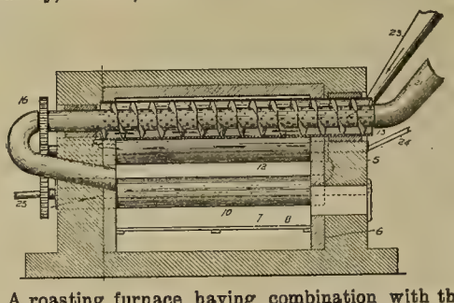
In a lifting pump, the combination with a single pump cylinder, a triple set of valved pistons axially mounted within cylinder, of a triple set of intermeshing miter gears, means for operating gears and a series of piston and connecting rods independently connecting each gear with its respective piston. The gear wheels, independently connected to their respective pistons, and means for simultaneously rotating gear wheels, so as to independently reciprocate pistons.

BOILER.—No. 627,321; M. P. Boss, San Francisco, Cal.



The combination with a furnace having a plurality of flues for the products of combustion communicating to give alternate currents in opposite direction, of a lower water cylinder extending from one flue into the next flue, an upper cylinder extending from one flue into the next, and a group or nest of vertical water tubes in each flue connecting the upper and lower cylinders, the first nest of tubes and first flue being directly above the furnace combustion chamber. A removable plate or cover in one of said cylinders opposite said tubes, whereby upon removing said plate or cover any tube of said group may be withdrawn through the plate opening. The combination with a furnace having a double fire chamber, and a central vertical flue, of a boiler comprising a mud drum located to form the dividing bridge wall of said double fire chamber, a steam drum in the upper part of said vertical flue and vertical water tubes in said flue connecting said drums.

PROCESS OF ELECTROLYTICALLY TREATING ORES.—No. 627,442; L. Pelatan, Paris, France.



A process for treating ores, the treatment of the charge by first passing an electric current through an agitated mixture of pulverized ore, or the like with water, and salt, and then adding a neutralizing agent, if the sludge be acid, and afterward adding the solvent and continuing the agitation and the passage of the current. The improvement in processes of treating ores electrolytically consisting in adding to a sludge, consisting of ore and water, a solvent and piric acid as an oxidizing agent and then passing an electric current therethrough. The process for the treatment of ores by first agitating the charge consisting of pulverized ore, water and salts, heated to a temperature of from 80° to 100° C., and passing therethrough an electric current of or about the density stated, the sludge being neutralized for acid, and afterward adding the solvent agent and continuing the agitation and passage of the electric current.

SAFETY SUCTION VALVE FOR PUMPS.—No. 627,454; C. S. Booth, Oakland, Cal.

In a compressing pump, inlet valves, seats in the cylinder head against which they are closable, cages having vertical central openings within which the shanks of the valve are movable, annular enlarged chambers formed within the length of central bores and collars formed upon the valve shanks intermediate of their ends and fitting and movable within chambers; inlet valves closable upwardly against seats in the cylinder head and centrally bored cages through which the valve shanks are movable, collars formed around the shanks intermediate of their length, annular chambers formed in the length of the bore of the cage having a length equal to the longitudinal movement of the valve in opening and closing, nuts or collars fitting upon the upper ends of the valve shanks and springs intermediate between the cages and nuts whereby the valves are closed after each opening thereof; the cages being formed in two segments, whereby they may be separated for the introduction of the valves and bolts by which they are held together after the valves are in place.

ROASTING OR DRYING FURNACE.—No. 627,333; W. Harvey, Denver, Colo.

A roasting furnace having combination with the combustion chamber and a number of conveyors journaled therein, means for delivering the material to one of the conveyors, means for discharging the material from one conveyor to the other, means for rotating the conveyors, whereby the material is made to travel through the adjacent conveyors in opposite directions, and a conduit communicating with the combustion chamber and leading to one end of the uppermost conveyor, whose opposite extremity communicates with the smokestack; conveyors journaled therein, each comprising two open-ended tubes, one placed within the other and connecting by an interposed screw thread, the inner tubes being perforated.

Amalgamated Copper Plates.

The bane of the mill man is the collection of oxides of certain insoluble salts upon the amalgamating plates. There are numerous remedies applied for the purpose of removing these patches of discoloration, some of which are good and some are bad. The continued use of cyanide of potassium is injurious to the plate, and this material should not be employed when a harmless substitute will perform the same function and do no damage to the plate. The following paper, written by Mr. N. S. Keith of San Francisco, Cal., treats the subject from a practical and scientific standpoint and cannot fail to be of both interest and value to mill men everywhere. The various suggestions made are the result of his own practical experience, are inexpensive and readily applied:

The discovery of the utility of amalgamated copper plates in the treatment of auriferous rock in the stamp mill has so simplified and cheapened the metallurgy of gold that it is now profitable to mine and reduce many gold-bearing ores and rocks that formerly would not pay the necessary expenses of manipulation by the old processes of amalgamation in arrastras, Chilian mills, amalgamators, barrels, etc. By the aid of the plates, in a majority of cases it is made unnecessary to submit the ore to a separate and distinct amalgamation after the operation of pulverizing, with all the attendant expenses of handling, loss, wear and tear of machinery, power, loss of quicksilver, etc. Instead, the amalgamation takes place in, as it were, the same apparatus which effects the reduction, and in a practical and effectual manner. This is the case, of course, after the gold is freed from its matrix. These virtues are not claimed in the case of ores in which the gold is mineralized (if there are any such) or covered by substances which prevent the contact with quicksilver.

The principal difficulty with which the mill man has to contend is the discoloration of the surface of the plate by oxides or various insoluble metallic salts, when it is so necessary to keep it bright and free from any film or covering preventing the easy and sure contact and adhesion of the particles of gold and amalgam as the pulp passes over. A new plate, then, is not considered in "taking condition" until it will remain bright for at least some hours after "dressing." With most plans of preparation this desideratum is not attained before a firmly adhering layer of gold amalgam has attached itself to the plate, which usually takes place after the loss of much gold, labor and time. The following described plan of preparation and treatment has been found most effective, and at the same time inexpensive, as compared with silver plating.

Composition plates made of copper, with a small quantity of zinc, have been used. Though they are very easily kept clean and are effective, they have been found too expensive, as they are easily broken. Their brittleness is caused by the union of the quicksilver with the zinc alloyed with the copper.

The conditions necessary to be observed in the preparation and care of amalgamated copper plates, that they may be put and kept in most effective order, are these: Quality of copper; method of amalgamating the plate; method of "dressing" the plate; purity of mercury; purity of water; character of ore or rock. In selecting the plate, take only the purest, softest copper, free from dark, rough spots of iron, etc. The quality known to the trade as "brasiers' copper" is the best from which to select the pieces. Do not take that which has been rolled with special care to make the surface smooth and hard, as that will not absorb the quicksilver so well as the softer and consequently more porous. It is best, for efficiency and durability, to select plates weighing not less than three pounds to a square foot; thicker is better. For inside plates, use that which is two or three times as heavy, as not being so easily bent and torn from position. If possible, buy copper which has been annealed subsequently to the last rolling. If not, then anneal the plates by exposing them to heat on the under side, sufficient to ignite sawdust laid upon the upper side. This may be done over a blacksmith's fire, but more handily over an open fire of wood or charcoal. Be sure to subject every part of the plate to the heat. This will soften the plate, making it more porous, and consequently capable of retaining more quicksilver and amalgam than it otherwise would. As the efficiency of copper plates is in proportion to their ability to hold quicksilver, this point must be carefully attended to. After this, straighten the plate by laying it on the table and using a wooden block and hammer. Do not strike with the hammer directly on the plate, but interpose the block, so that the face of the copper may not be compressed or drawn out of shape. Fasten then to the table with iron screws, or, preferably, copper nails long enough to clinch on the under side of the table. In either case, have the heads of screws or nails flush with the face of the plate. Do not use brass screws, as quicksilver soon penetrates and makes brittle the heads so that they will not hold. The minor inequalities may now be removed by the use of the block and hammer.

Next scour the plate with wood ashes and fine sand or tailings, using a scrubbing brush or coarse rag. Bad spots may be scoured with the ashes and sand, and the end of a small block of wood. Continue the scouring until the coating of oxide is entirely removed and the bright, metallic copper exposed. Caustic soda, the concentrated lye of the shops, or sal soda, may be used instead of ashes, the object being to remove all traces of oil or grease by action of alkalies. After washing with clean water, apply with a soft brush, or swab, a solution of cyanide of potassium, say one-half ounce of cyanide to a pint of water. The plate may be readily amalgamated by the use of the following mixture: Fine sand or tailings, powdered sal ammoniac, equal parts, and containing a small quantity of quicksilver sprinkled therein. With the scrubbing brush and this mixture continue the scrubbing until all parts of the plate are amalgamated. During the operation sprinkle on the plate as much quicksilver as the plate will absorb, and water enough to make a thick mud of the mixture. I have used lime with this mixture, but cannot say that the addition is of any special benefit. It is unpleasant, to say the least, as ammonia is set free in great quantity. Allow this mixture to remain on the plate for an hour or so, and then wash it off with clean water and the brush. Follow with the soft brush and cyanide solution, adding quicksilver, if the plate will hold it. By continuing this treatment for three or four rounds, the plate will be found to have taken up or absorbed as much quicksilver as ordinarily after many weeks' running. If fine gold amalgam can be spared, it is well at this stage to rub some upon the plate, using a cloth rubber wetted with a solution of sal ammoniac, in the proportion of four ounces to the pint of water. If the amalgam be heated and rubbed in a wedgewood mortar, so as to insure the solution or minute diffusion of the gold, it will be the more readily attached to the plate. I have used silver amalgam in the place of gold amalgam, with excellent results. Silver amalgam can be made as follows: Dissolve a piece of silver—coin will answer—in the smallest possible quantity of dilute nitric acid. Heat will hasten the solution. Dissolve the resulting crystals of nitrate of silver in water, and pour into the vessel enough quicksilver to reduce and amalgamate the silver in the solution. This reaction will be completed in a few hours. Wash the amalgam with clean water, to remove all traces of nitrate of mercury, and strain to remove the surplus quicksilver, leaving in the cloth a pasty amalgam of very pure and finely divided silver. Use this as directed for the gold amalgam.

The rationale of this plan of treatment may be stated as follows: The first scouring removes oxides and grease, and exposes the pure, bright metal, which by the annealing has been rendered capable of holding a comparatively large quantity of quicksilver and amalgam, by virtue of its porosity. The sal ammoniac, by reason of its property of dissolving oxides, assists the amalgamation by keeping a bright metallic surface, allowing the quicksilver and amalgam to penetrate the copper, filling the minute interstices, and combine in atomic proportions, so as to form an alloy of copper, gold and quicksilver. Thus air, water and various salts are kept from acting directly upon the copper, preventing the formation of oxide and carbonate of copper to coat the plate. This is accomplished in a longer or shorter period, depending upon the mode of preparation and upon the richness of the ore and the ease with which the gold in the ore may be amalgamated. It is probable that the galvanic current due to the contact of two dissimilar metals plays an important part in influencing the chemical reactions and assisting the amalgamation of gold, but as its exact action is not defined it is needless to discuss the point in this article.

The point aimed at in this plan of preparation is to hasten the union of a sufficient amount of gold and quicksilver with the copper. If allowed to take place slowly, the unavoidable loss of gold makes the expense much greater than if forwarded by the use of the needful amount of amalgam, before running any ore over the plate. If an old, well-used plate be cut or broken the amalgam will be found to have penetrated perhaps half, and in some cases completely, through the copper.

Corrosive sublimate, nitrate of mercury, sulphuric acid, and common salt, muriatic acid, sodium amalgam, cyanide of potassium, and other acids and salts, have been used in amalgamating copper; but though the amalgamation may be accomplished in some cases quite easily, the plate cannot be brought to a good working condition so soon, if at all, as in the way described.

The subsequent treatment of plates, amalgamated as described, should be varied to suit the circumstances of kind and quality of ore and purity of water. Water containing carbonic acid discolors plates readily, forming an insoluble coating of carbonate of copper. Though an infinitely thin film, it is sufficient to prevent the contact and adhesion of gold and amalgam, unless in particles sufficiently large to break the coating. The worst form of discoloration of plates proceeds from the action of sulphates or iron and copper present in many ores from the natural decomposition of the pyrites. The addition of lime to the water introduced to the battery, as much as will dissolve therein, will neutralize the carbonic acid and decompose the sulphates. It may be necessary to add lime to the ore to furnish enough to react on all the sulphates.

When the mill is in operation the plates should be "dressed" every six hours, or oftener, should they become discolored. After stopping the mill and washing the plates with a stream of clear water, apply with a soft brush (a whitewash brush is handy) some of the solution of sal ammoniac. Allow the sal ammoniac to remain on the plate a few minutes, wash with clear water, and apply with the brush enough of the solution of cyanide of potassium to brighten the plate. The plate should have upon it as much quicksilver as it will hold without gathering in drops or running off. Experience in this matter will teach the niceties of manipulation to the mill man.

It is essential to use quicksilver entirely free from "base metals," such as lead, zinc, tin, copper, etc. The presence of gold and silver is, of course, desirable. The base metals, when combined with quicksilver, oxidize very readily, especially when the amalgam is finely divided, exposing a large surface to the action of water, air and other oxidizing agents. Thus, with impure quicksilver the coating on plates may arise from the amalgam, instead of the copper itself.

To test the purity of quicksilver, put a small quantity on a sheet of paper while dry; if, when moved upon the paper, by inclining it in various directions, a film adhering to the paper is left on the track, the quicksilver is impure. Another test: Put half an ounce or so in an ordinary iron "gold pan," and by a quick up and down jerk separate the mercury into small globules; if, on inclining the pan, they do not readily run together, the sample is impure. To purify, first retort the quicksilver, and add to it after retorting a few ounces of dilute nitric acid (acid one part, water three parts). An ordinary acid bottle is a handy vessel to hold mercury and acid, as it may occasionally be agitated to hasten the purification by bringing the acid in contact with the impurities. The acid, by reason of its greater affinity for the base metals, removes them by forming nitrates. Some days may elapse before the quicksilver becomes purified. Samples may be tested from time to time by the plans I have mentioned. Before using the quicksilver it should be repeatedly washed with water to remove all traces of nitrates. It is a good plan to keep a supply of quicksilver under treatment, putting all which has been used into the bottle, and drawing from it such an amount of purified as may be required.

A stock of needful chemicals should be kept at the mill. The following list comprises those necessary for the preparation and treatment of plates and quicksilver: Cyanide of potassium (fused), sal ammoniac (powdered), caustic or unslacked lime, caustic soda or "concentrated lye," and nitric acid (commercial acid is sufficiently pure). Cyanide of sodium may be substituted for cyanide of potassium; common salt for sal ammoniac; wood ashes, or the lye therefrom, or sal soda, for the lime and soda, and sulphuric acid and saltpeter for nitric acid. These substitutes are but "makeshifts" at best, and consequently should not be used when the others are at hand or can be procured. It is well to keep ready prepared the solutions of sal ammoniac and cyanide of potassium in well-stoppered bottles. The cyanide solution, being especially liable to decomposition, should not be prepared in large quantities at a time. It should also be carefully kept and labeled as poison, to prevent accidents.

Official Statement of Annual Gold and Silver Production.

Director of the Mint Roberts has announced his final estimate of the production of gold and silver in the United States for the calendar year '98 as follows:

State.	*Gold.*	*Silver, fine ozs.*
Alabama	$ 5,000	100
Alaska	2,524,800	9,200
Arizona	2,465,100	2,246,800
California	15,637,900	642,300
Colorado	23,185,300	22,815,600
Georgia	128,600	500
Idaho	1,716,900	5,073,800
Iowa	100	.....
Maryland	600	.....
Michigan	100	32,400
Minnesota	100	.....
Montana	5,126,900	14,807,200
Nevada	2,944,500	805,000
New Mexico	539,000	425,300
North Carolina	84,000	700
Oregon	1,177,600	130,000
South Carolina	104,200	300
South Dakota	5,699,700	152,300
Tennessee	900	.....
Texas	300	472,900
Utah	2,285,400	6,485,900
Virginia	4,500	.....
Washington	766,200	254,400
Wyoming	5,300	100
Totals	$64,463,000	54,438,000
Totals for '97	57,333,000	53,860,000

The commercial value of silver bullion for '98 was 59 cents per fine ounce, while for '97 it was 60 cents. The above estimate shows an increase in gold for '98 over the previous year of $7,130,000, and 578,000 ounces of fine silver.

Diamond and Gold Mining in Minas Geraes, Brazil.

NUMBER III.

It is impossible to obtain exact information as to the present output of the Diamantina field. No statistics are kept, and the buyers are so numerous and scattered that they cannot be reached. The same was true of the ancient production. The statistics which have from time to time been published by Europeans are merely estimates.

The extensive mining of diamonds in Brazil began in 1740, when the first lease was made by the Portuguese Government. The period of greatest production was between 1750 and 1770, under Caldiera Brant, sole contractor, and his successors. These contractors made a practice of concealing from the Government the amount of their production, and of using a greater number of slaves than that to which they were limited by their contracts. Tradition alone preserves an approach to the truth as to the extent of their operations. If it can be trusted, the production of 1740 to 1750 was not less than 50,000 carats a year, and that of 1750 to 1770, 150,000 a year. From 1771, when the Government began extraction on its own account, until that system fell into disuse, we have fairly trustworthy statistics of the Government production But contraband mining flourished at the same time, and its extent can only be estimated. Between 1771 and 1795, the Government mined 40,000 carats a year. For the next ten years it fell to 20,000 carats a year. During this period, the contraband production was believed to be as large as the legal. From 1807, the disorganization of the Portuguese administrative system and the increasing sentiment of local liberty in Brazil, both largely due to the Nepoleonic wars and the flight to Brazil of the royal family, sapped the efficiency of the Government "extraccao," and private mining gradually but completely took its place. During the present century, the production has varied from year to year. The freedom of mining has tended to increase it; but, on the other hand, alluvial mining has on the whole decreased with the exhaustion of the easily worked beds and known localities. This latter tendency has not been counteracted by the introduction of improvements in the method of working, nor by any great energy in searching for fresh fields. Sir Richard Burton, who visited Diamantina in 1867, reported it to be very prosperous and quotes an estimate made by an exporter, of an annual production of 80,000 carats. The best local estimates of the present output approximate 25,000 to 30,000 carats a year.

Until thirty years ago, there was no diamond cutting in the district. It is now carried on extensively in Diamantina and the neighboring villages. The quaint little mills are supplied with power by overshot water wheels. The process of cutting does not differ from that employed in Europe. The machinery comes from Holland. The work is fairly good and very cheap. Most of the stones are cut into the brilliant shape. In this, they lose about 50%. The rose shape loses 15% more by making an additional row of facets.

Gold Mining.—The principal gold-producing territory of Minas begins 250 miles north of Rio de Janeiro and extends along the Sierra de Espinhaco and much farther toward the north. Gold is found and mined in other localities, but the bulk of the past and present production of Brazil is from this district. The discovery was made in 1693 by slave hunters from the province of Sao Paula, who were after Indians. There was an immediate inrush of adventurers, and by the beginning of the eighteenth century thousands of them with their slaves were scattered all over the territory which has since been so productive. Until 1760 the production continued to increase rapidly, in spite of the exorbitant and tyrannical exactions of the Government and the rude and superficial methods of mining employed. At its maximum, it amounted to more than 320,000 ounces a year. After 1760 it declined, at first slowly and then after 1800 rapidly. The industry revived in the years following the independence of Brazil, in 1822, with the introduction of foreign capital and underground mining. While modern production has never been as extensive as that of the last century, it has been and continues to be fairly profitable and prosperous.

The earliest mining was from the placers in the beds of the small mountain streams. These were exploited in a manner substantially similar to that used for diamonds. At first, the gravel was washed in small wooden or metal plates and the gold picked out by hand. Later, the "batea" was introduced, probably from Africa by slaves. In this, a fairly complete separation of the metal was possible by the use of water and the familiar gyratory motion. When the bed of the stream was exhausted, the miners went up the sides of the valley finding deposits left in abandoned beds of the river or higher up the flanks of the hill. In following the gold the miners finally came to the veins. In Brazil, these are often of friable material, which can easily be pulverized with the aid of running water, and the country rock on either side of the vein is also frequently of the same character. Where such veins were found, the ancient open mines so characteristic of Brazilian gold mining are encountered. It is evident that the miners knew nothing of underground mining, and, except in rare instances, their excavations are open to the top. These great gullies were made with the assistance of running water, brought from considerable distances in canals carried along a high level of the mountain flank. The water was conducted to the point where the lower outcrop of the vein began, and, as it flowed, with the aid of a pick and shovel the ore and surrounding material was cut away. This process was continued backward up the hill until the gully became so deep that the debris was unmanageable. The extent of some of these excavations is enormous. One at Sao Joao de Chapada, a few miles south of Diamantina, is 150 feet deep, 1000 feet wide and 2000 feet long. The mass of material washed down was concentrated in the rudest conceivable manner. Even the use of the sluice was not understood, and in its place the gravel was given its first wash in a "canoa." This is merely a level section of the canal in which the gravel and debris is carried down. The water is allowed to fall into this level space over a lip a few inches high, and a workman stirs with a sort of rake the gravel at that point. Below the "canoa" there is an inclined plane covered with hides laid with the hair up, in order to catch the gold that does not sink to the bottom. In addition to the loss of gold inevitable with such a system of washing, the miners labored under the disadvantage of being likely to lose their vein by the falling in of the side rock. And not only did they lose the clew, but it is lost forever. Many of these old mines are undoubtedly still rich, but the veins are so covered up by the debris that their outcrops cannot be found and traced.

An interesting feature of the larger hillside mines are the "mondeas," rectangular masonry reservoirs 50 to 80 feet square and 10 to 20 feet deep, made to catch and hold the material washed down from the mine until it could be conveniently worked. They were necessary where the amount of water was large. In the few instances where the old miners exploited veins for which no water was available, they simply dug an open pit, carrying out the mineral and earth upon the heads of slaves.

The running of underground galleries and scientific mining did not begin until the Baron de Eschwege, a German expert sent by the Portuguese Government in 1815 to examine and report upon the mining industry, came to Minas and devoted himself to its development. While the enterprises he set on foot were not successful, he gave to the scientific and mining world valuable information concerning the gold deposits of Minas. After 1822, when Brazil became independent, the laws were made more liberal, and foreign companies were permitted to enter the field. With the formation of the Imperial Brazilian Mining Association in 1824, the company that afterwards owned the celebrated and rich Gongo Seco mine, began the introduction of foreign, and especially of English, capital. The major part of the exploitation since has been by foreign companies.

The gold-bearing mineral of Minas is principally of two kinds—quartz in veins and itaborites, or "jacutinga," a nearly pure peroxide of iron in beds. The quartz is sometimes of the ordinary free-milling varieties, white or smoky in color and little mixed with other mineral, or else in the form of quartzite. The principal mines in this kind of quartz are the Boa Esperanca, Carranca and Juca Vieira, near Caethe, and the Banderinha, near Diamantina. The Juca Vieira has lately been producing about 600 ounces annually and the Carranca half as much. The other mines are even less important.

Of greater importance than the free-milling quartz mines are those in veins where the quartz is mixed with pyrites. The vein of the Morro Velho, the largest mine in Brazil, is of this character. The ore is composed of fine-grained quartz and iron and arsenical pyrites, mixed with pyrrhotite and copper pyrites, siderite and calcite. Over 2,000,000 ounces of gold have been extracted from this mine by the Saint John d'El Rei Company, an English corporation formed in 1830. Brazilians worked it during the last century, employing the old open cut method. It is related that when powder could not be obtained, fires were built and the quartz cracked by throwing cold water upon it. In 1818, the mine had been abandoned; but about 1830 it was bought by an Englishman who sold it in 1834 to the present company for £56,000. The mine came into full operation in 1842, and from then until 1867 an annual dividend of 25% was paid upon the capital of £135,000. In 1867 the shafts had reached a depth of 1200 feet, when operations were interrupted by the burning out and falling in of the mine. The destruction was so complete that it was found necessary to sink two new shafts to the same depth as the former ones in order to reach the vein. The cost was about $430,000. In 1874 the payment of dividends was resumed. They averaged 31% until 1882, when difficulties with water began to be met with on account of the depth (nearly 1900 feet) the mine had reached. The ore also became poorer. In 1886 the mine once more caved, and the ruin was again so complete that for the second time new excavations had to be made. G. Chalmers, the present manager, undertook the work. He drove a drift 1100 feet long and put down two shafts, one 2190 and the other 2310 feet deep. Mr. Chalmers abandoned the old milling machinery and has installed a 100-stamp mill of California design and an extensive chlorination establishment, which has proved effective in reducing the refractory portion of the ores. Power is furnished by Pelton wheels operated by water collected by artificial canals from a wide area of mountain. At times this proves insufficient, and it is helped out by steam engines which burn wood cut in the neighboring forests. Since 1890 the mine has once more been profitable. The ore now being extracted yields, under the scientific treatment employed, $\frac{9}{10}$ of an ounce per ton. The annual output is about 50,000 ounces. The form of the ore body is interesting to mining engineers. It consists of an oval swelling in a vein. The vein itself is vertical and the "chimney" is inclined at an angle of 45° in the vein. At the surface its outcrop is 800x60 feet, and it varies considerably in size as it descends, but always maintains an ample width. The average dimensions of the "chimney" are about 50x500 feet. Having such a large ore body in a single mass, the mine is unique in the tremendous extent of the open excavations from which the mineral has been taken.

The mine is situated fifteen miles south of Bello Horizonte, the State capital, and may be reached from there on mule back over a mountain trail. A more convenient route is from the nearest station on the Central railroad, from which it is distant only a few miles by a wagon road. Of the employes, seventy-five are English.

(*To be Continued.*)

Electrical Equipment of Cripple Creek, Colo., District.

To the Editor:—There are four electric power plants whose field of operation comprises Cripple Creek district. That of the Colorado Electric Co. is at Canyon City, thirty-five miles distant, whose source of energy is the Arkansas river. Its capacity of 2000 H. P. is generated at a pressure of 500 volts and is transformed to 20,000 volts for line transmission. At the two distributing stations, one on Globe hill and the other on Bull hill, it is retranformed down to 500 volts for use at the motors. Each distributing station is equipped with three step-down transformers. Thus equipped, this company makes a speciality of supplying power for hoists and mine and mill machinery generally.

The power station of the Cripple Creek Electric Railway Co. is at Lake Moraine, near the foot of Pike's Peak. From this plant the power is transmitted over the line at a pressure of 6300 volts to midway station, where it is transformed down to 350 volts by static transformers, and is then transformed to direct current by rotary converter to 550 volts for car line service. The rails on this line are about eighty-six pounds. The cars have double trucks with two motors on each.

The plant of the La Belle Mill, Water & Power Co. is at Goldfield, and comprises two direct connected, three-phase generators, 600 K. W., of the General Electric revolving field type, and are equal to 801 H. P. They are driven by a McIntosh-Seymour cross-compound engine. Power is generated at a pressure of 6600 volts and will be transmitted at that voltage, transforming to about 440 volts at mines and other points of application in the district. The switchboard is a special type and all the apparatus thereon is designed for this plant, possessing the novel feature of having no high-tension parts within reach or in any way exposed. The steam plant consists of six Babcock & Wilcox boilers, each of about 400 H. P., having automatic stokers, the coal being supplied from hoppers suspended in front and above the boilers, which are features of economy. The plant includes a cross-compound compressor of the E. P. Allis type, but with Ingersoll-Seargent cylinders, being of thirty-drill capacity. By this auxiliary compressed air is to be transmitted to various large mines of the district.

The main province of this plant is supplying hoisting and drill power to the mines and motive power to the mills. It is estimated there are about sixty electric hoists operated in the district. While the three plants named incidentally furnish light for various plants and the last named for various towns of the district, the plant of the Cripple Creek Light Co. at Cripple Creek, operates for lighting purposes exclusively. WASCOTT.

Cripple Creek, Colo., June 17th, '99.

Large Masses of Copper.

It is now claimed that the largest mass of copper ever found in the Lake Superior region was taken from the Phœnix mine, and not from the Minnesota mine, as commonly supposed. It weighed 665 tons, considerably more than the Minnesota mass. A piece weighing 11 tons was sent to Boston and placed on exhibition. Forty kegs of common black powder were required to dislodge the chunk in the Minnesota mine, in 1857. The mass weighed 527 tons, was 39 feet long and 9 feet thick. Thirty men were employed on it at one time and twelve months were consumed in cutting it up and getting it to the surface.

Mining Summary.

ALASKA.

On Gravina Island a copper ledge is being developed by Boston capitalists. There are four claims and a 21-foot ledge of ore. Assays from the discovery show copper and $5 gold. Mgr. White says the main body of ore is within a few hundred yards of the seashore and near it runs a creek carrying water to develop 100 H. P.

The Sea Level M. & M. Co.'s property is on Thorn Arm, sixteen miles from Ketchican. The company has a 50-foot ledge.

Victoria *Times*: Miners who, under E. S. Ingraham of Seattle, were sent north by Prince Luigi, nephew of the king of Italy, report having struck it rich near Port Clarence. A letter received from C. E. Chard says the find has been made on an unmapped creek near Port Clarence, one of the United States government reindeer stations. Fourteen claims have been staked. In five hours Chard and two others took out $20 from the discovery claim with a rocker. At Golovin bay 1500 people are said to have reached that district, many of whom have gone to Port Clarence, where they purchased all of the fur clothing to be had at that station.

ARIZONA.

The Phœnix G. M. Co. has arranged to reopen the Phœnix gold mine, eighteen miles north of Phœnix. The ore is low grade, but the veins are large. The development is superficial. There is a 70-stamp mill on the property and a small cyanide plant, which will be used. W. Christy of Phœnix is Pres. of the company which controls the mine.

A fire, originating in the reverberatory furnace building of the United Verde copper mine at Jerome, Ariz., communicated to a pile of 800 tons of coke in bins near the works, and, it is reported, spread to the upper works of the mine, when it was finally gotten under control. The country is hot and dry and water scarce. The fire is said to have resulted from friction of a belt on a pressure blower.

It is reported that the Old Dominion smelter will be shut down for the reason that the fluxing ore of the Continental mine, recently acquired, is not yet available for smelting purposes, and that pending the time when the Old Dominion can use this ore as a flux the smelter will be closed. There is said to be a loss of 2 to 3% of copper under present method of treatment.

A strike is reported in the Quijotoas, where it is claimed a large mass of rock crops boldly for two miles, which all contains gold.

Yuma *Sun*: M. Winsor has gone to the Copper Mountain country to investigate mining claims in that section.——The King of Arizona Co. will soon have the pipe line from the new well to the mine complete. The machinery at the mine is being placed and will be ready for the ore by July 20th.——G. H. Miles and F. O'Brien have gone to the Tule Wells district to do development work on copper prospects they have discovered. —— Marcus Daly of Butte, Montana, has a bond on a group of mines in the northeastern portion of Yuma county on which his agent is doing development work.——A group of mines in the Castle Dome mountains, twenty-two miles north of Gila City, belonging to Modesti & Avila, has been worked in a small way for the past four years and is developing into a good lead mine. Two shafts have been sunk 110 and 50 feet with a tunnel connecting from the bottom of the 50-foot shaft. The ledge is 2 feet wide. The ore is solid and runs 50% lead with a small amount of silver. Returns from two carloads of ore shipped to Pueblo show a profit of $2,623.99. Two carloads are being sacked and will be shipped. As soon as the 200 level is reached a steam hoist will be put in.

Arizona *Star*: A strike was made recently at the Blue Jay mine. A new shaft has been sunk farther up the hill, and in this a vein of ore was found. A sample was assayed and found to run 170 ounces in silver.——J. R. Holmes has located five miles west of Kirkland three gold prospects. The ledge he describes as an ore body carrying shipping ore from the grass roots down. Mr. Holmes recently sold the Monarch mine to A. W. Fisher. The Monarch adjoins the Monte Cristo.

CALIFORNIA.

Alpine.

Winnemucca *Silver State*: Dr. Loope of Bessemer, Mich., will put men to work on the old Lincoln mine at Boulder hill under the superintendency of P. Curtz. With an extension of 300 feet they expect to tap the ledge on which Musser & Lewis made the recent strike.

Amador.

Sutter Creek *Record*: At the Central Eureka mine, near Sutter Creek, the vein has been reached in the north drift on the 1350 level, 25 feet from the shaft.——A strike has been made in the Baltimore mine, formerly the Tripp mine, near Blue Lakes City, on the Mokelumne.——The Tellurium at Pine Grove has been shut down. It is reported that operations will be resumed in July.——M. Tangerman, who bought the Boyrie property at Clinton, is ready to start hydraulicking. ——The McPherson Bros. at Pine Grove have men at work on the gravel claim they are operating there.——The Spagnoli shaft is down 115 feet. The station at the 100 level has been cut and sinking resumed.

Amador *Ledger*: At the Bay State, four miles north of Plymouth, operations are being pushed. Thirty men are on the payroll. At 700 feet in the shaft a crosscut is being run to the vein, and the sump, 50 feet below, is being cleaned out that sinking may be resumed, the objective point being 1100 feet. A bulkhead has been put in at the 300-foot level to hold the water.——L. A. Gross, who went East a few months ago to organize a company to operate the Centennial mine near Drytown, telegraphed to Mr. McWayne at Drytown to have the water taken out. This was accomplished when Mr. Gross returned this week. New York and Boston capitalists have been interested and when the shaft is repaired sinking will be commenced to develop to 1000 feet.——Col. Ranlett at the Newton mine is reopening the property rapidly. The shaft has been repaired and they are taking out ore. On the surface tracks are being laid and preparations made for the erection of the 80-ton smelter.——Supt. S K. Thornton of the Shenandoah mine near Plymouth has the shaft down 125 feet in a body of white quartz which is 9 feet thick and prospects. This is the property formerly known as the Easton mine.——The Tellurium mine was closed down on June 10th.

Amador *Dispatch*: Supt. Marsh of the Butte Mountain mine near Clinton reports the tunnel in 384 feet, and that he does not know the width of the vein at that point, as there are no walls visible. Where the ledge was encountered it was 8 feet thick and has grown wider as the tunnel advanced. An upraise has been finished and shows a body of ore 200 feet high that assays $6.40 a ton. The ore in the breast of the tunnel assays $7.60 a ton. There is a 10-stamp mill at the mine, five stamps of which are dropping. Mr. Marsh will have the other battery in operation in a few days. —— The shaft at the Spagnoli mine, Clinton, is now down 120 feet and still sinking. It is expected the shaft will tap the ledge at 200 feet.

Amador *Republican*: It is reported that the Amelia G. M. Co. near Jackson will resume work at the Amelia mine within sixty days. ——A new strike is reported in the Central Eureka mine near Sutter Creek.——The Eureka mine, owned by Mr. Steele of San Francisco, which is near Pine Grove, will be started up to prospect the property.——The MacPherson Bros. are running their gravel mine near Pine Grove with a full force. It is said the former operators could not pay expenses.——M. Tangermann has the preliminary work finished and will start hydraulicking on the gravel mine purchased from Mrs. Boyrie at Clinton.

Butte.

A new 4-stamp mill is being built on the Lawton quartz mine near Hurleton.

Calaveras.

The extensive work of the Melones M. Co. at Robinson's Ferry is causing considerable activity there, and increase in the population.

At the Shuman gravel mine, three miles from Mokelumne Hill, a tunnel is being run 1100 feet from Old Woman's gulch towards Happy Valley to drain the mine.

Burton, Maxoli & Co. are operating a hydraulic mine in Chili gulch. The company owns the Green Mountain mine, famous for its quartz crystals. The company also owns a gravel claim at Camanche, where they will operate this season.

Three years ago J. Crannis and M. Hultodo, while prospecting on the Vorlander ranch near the Calaveras river, struck quartz that assayed $20 per ton. They sunk 45 feet, and sold out to G. W. Provard and Dr. Lewis. Dr. Lewis recently secured control and during the last six months has been sinking a shaft on the ledge. A contract for an additional 100 feet has been let to Wm. Fuller for $1000. Ninety acres of the Vorlander ranch has been purchased for mill site, etc.

The Lamphear mine is one and a half miles southeast of Mokelumne Hill on Spring gulch. A shaft has been sunk 250 feet in the footwall, from which a crosscut 35 feet reached a vein of quartz 8 feet thick with 4-foot gouge. The fissure is found at contact of granodiorite with slates of the Calaveras formation. Mr. Harris, manager and part owner, reports the mine paying. This mine was discovered in working the gravels overlying by hydraulicking.

At the Esperanza, 2½ miles east of Mokelumne Hill, which has been shut down for a short time, a drift on the north side of the shaft at the 950-foot level has reached a 6-foot vein of quartz. Heretofore all the prospecting has been done south of the shaft and results were unsatisfactory. A force will continue the drift and test the ore while a new hoist is being erected, and if developments warrant an addition will be made to the mill.

A number of gold specimens, ranging in value from $1 to $50, have recently been found in the southern part of the county by C. Schroebel.

It is reported that operations are to be resumed at the El Encino gravel mine, near the Junction, in Chili gulch, two miles from Mokelumne Hill.

Calaveras *Citizen*: It is reported that C. D. Fontana has sold the copper property owned by C. Braids to the Ames family for $27,000. The Braids property divided the lands of the Union Copper Co., owned by Ames, which has been shut down since '93. It is reported the mines are to be reopened.

Colusa.

The Mammoth Copper M. Co. has been incorporated to operate copper mines in the Coast Range in this county.

El Dorado.

The electric power plant of the Boulder M. Co., which furnished power for mines near Kelsey, was destroyed by fire recently.

Georgetown *Gazette*: Work on tunnel No. 5 of the Josephine mine is being pushed.——It is reported that work will be resumed on the Two Channel mine at Kentucky Flat.——Five men are at work on the Gentle Zephyr mine, near Josephine.

Placerville *Nugget*: A strike has been made in the Bluebird mine, near Placerville. The property, owned by Mr. Morey, is being worked by Mr. Niedecker.

Placerville *Republican*: The Balmacedo, near Nashville, under Supt. R. Smith, is showing good prospects. He is developing a pay chute which has not disclosed its full proportions.——It is said that the Richmond, near Nashville, which has been idle for some time past, will resume operations.——T. Higgins' Yellow Pine mine, near Nashville, continues to pay. A new mill is being considered.——An addition has been made to the force at the Montezuma this week.

Inyo.

Randsburg *Miner*: Gordon Bros. have a mine in the Slate range, where they are putting up a 2-stamp mill. They had been shipping ore. They have water at Borax lake, a mile and a half from the mine. Their ledge is flat.

Kern.

Randsburg *Miner*: The Little Butte Co. has shut down. The reason is not given.—— The Stanford mine, owned by Kuffell, Nixon, Mann & Wilson, has had 125 tons of ore crushed at the Red Dog mill, which returned a brick worth over $2800.——The Kinyon mill is running on twenty tons of ore which is estimated to turn out between $200 and $300 to the ton.——At the Yellow Aster work is going forward steadily. The Hercules crosscut is connected with the west drift on the Trilby on the same level. The working force has been reduced by twenty-five men, the development making it posible to keep the mill running with a smaller working force. Development work at the wells will be suspended as soon as connection is made between the shaft now being sunk 300 feet distant from the first well and the tunnel. The water supply is now abundant and the mill could be run without pumping back from the reservoir.

Los Angeles.

(Special Correspondence).—A cyanide plant has been built on Mount Gleason, several miles southwest of Acton, at an altitude of 6000 feet.

The King of the West shaft at the side of the track of the Southern Pacific Railroad, half a mile west of Acton, is to be reopened by English people. The work is in charge of Mr. Woodside.

The Esperanza mine at the head of Acton valley has opened a 2-foot vein of rock which runs $30 per ton.

It is reported that a vein of gold rock has been found in Aliso canyon, southeast of Acton.

The Old Padre mine on Mount Gleason is once more being cleared out by Mr. Jones. The vein occurs in a peculiar felspathic rock and varies in width from a seam to 8 feet of solid quartz, which appears in a succession of lenses. The rock carries free gold and auriferous iron sulphide, but it has never had a fair trial in experienced hands.

Acton, June 26th, '99.

Madera.

It is reported Madera will have the smelter to be erected by the California Copper Co. on the north bank of the Fresno river. It is to be of 100-ton capacity and to be in operation Oct. 1st, '99.

Nevada.

The Supt. of the North Star Mines Co. reports a shipment of bullion for the first half of June, the estimated value of which is $16,400. They have struck rich ore in Stockbridge No. 15 and ore is reported improving in the Central.

Otto Woehler is opening the McKillican copper mine near North Bloomfield; 100 tons of ore have been taken out which will be shipped.

Placer.

Attention is being given to the porphyry dike four and one-half miles southeast of Colfax. The Nisson and Wise & Partridge claims produce well when water can be secured. The width of this dike is from 50 to 100 feet and it can be traced from near Colfax to Butcher Ranch, ten miles.

H. J. Wise, J. H. Butts and G. Thompson are developing a group of claims across the American river from Colfax, embracing the Adelaide, Alma, Gladys and Bassil. Water will be brought 4000 feet from Owl creek; 2000 feet of the ditch has been graded and 1600 feet of flume will be built.

Supt. J. J. Sullivan reports that he has forty-four men on the payroll at the Pioneer mine, near Damascus, and says miners are scarce. Main No. 5 tunnel is in 4369 feet, running west 2569 and bearing south 1800 feet. Sinking on the ledge from the No. 4 tunnel is in progress, down 250 feet, and is 1250 feet from the surface.

Auburn *Herald*: The ore at the Grass Ravine mine is improving. It is rich in galena sulphurets.——The Polar Star is paying, the returns being larger than expected.——The Morning Star and the Big Dipper mines near Iowa Hill are working the usual number of men and paying the usual dividends.——The Red Point mine near Damascus is paying.—— The Marguerite mill will be started up again. ——Three shifts are working at the Jupiter Con. The machinery is in place. Sinking the slope is in progress.

Sacramento.

Folsom *Telegraph*: Another gold dredging machine will be built in the vicinity of Folsom. The Boston Exploration Co. last week closed a deal for 100 acres of Sailor bar, which was very closely prospected for the precious metal recently. The style of dredge to be used has not been decided upon. The company has under bond and is prospecting several other properties in the vicinity.

San Bernardino.

A. G. Campbell, Supt. and owner St. George and Gold Bar mines at Vanderbilt, says they have improved rapidly and that the output is limited by the supply of water, for which he is compelled to depend on the mines themselves. The flow has increased with depth, and during the past season he has handled twenty tons daily with gratifying results. He confirms the report that he was offered $300,000 for his property at Vanderbilt.

A new hoist is to be placed on the Sidewinder mine, ten miles east of Oro Grande station. This mine contains an auriferous ore which has proven rich enough to ship. It is several miles from water and timber.

A strike is reported from the Winchester mine in Providence mountains, north of Fenner station. The old Bonanza King is in these hills. The Hidden Hill mine is a small vein of high-grade gold rock.

San Diego.

It is reported that I. Trumbo will get the Golden Cross mine, near Ogilby, and that as soon as the receivers can wind up their accounts possession will be restored to him.

The Donohue mine near Dulzura is being worked after a long idleness. The veins of this district occur in felsite, along zones of fracture and crushing. The ores are oxidized near the surface. In depth sulphides appear, notably arsenical sulphide.

Shasta.

(Special Correspondence).—M. A. Hearne has given to a Boston company, through C. D. Galvin, a working bond on seven copper claims seven miles south of Kennet. The transaction was closed last week and ten men put to work. Three development tunnels have been run by the owner aggregating 300 feet—the longest, 120 feet, all in ore. The vein matter is 65 feet wide. The ore assays $3.25 gold, two to five ounces silver and 5% (average) in copper.

Some encouraging indications were found last week in the Golinsky properties, being developed by Lewishown Bros.

A. G. Myers has secured an option on fourteen copper claims near Kennet from G. Graves and is doing prospect work.

Kennet, June 26th, '99.

(Special Correspondence).—C. D. Galvin of Montana and J. Fillus of Denver, Colo., have bonded the Shasta King group, lying north of the Balakalala property on Squaw creek. The capital comes from Boston and the company will erect its own smelting plant. The property consists of eleven claims on the south fork of Squaw creek, and this creek will be utilized for power when a compressor plant is put in.

Redding, June 27th, '99.

Redding again reports that another smelter is to be built on Sillwater creek, twenty miles from Redding, in Shasta county, by a German company.

Supt. S. F. Sheppard of the Old Spanish mine is sinking a double compartment shaft in new ground of the Old Spanish.

B. Swasey, who has a lease on the Thompson mine near Shasta, is finding good ore. The first shipment of rock to the Keswick smelter went $14.60 to the ton. There is another lot of fifty tons at the smelter.

Redding *Searchlight*: C. D. Galvin and F. Grotefend are developing three copper properties. Twele men are employed at the King Copper above Copley, eight at what is known as the Galvin group and ten at a new camp started on the Heorne, Stevenson & Schneider property. At these mines day and night shifts are being worked.

Sierra.

The Thistle Shaft Co. has a boring machine at work locating the gravel channel and determining the distance to bedrock, along the ridge, below the works, within the boundary lines of the company.

Spencer & Gould are credited with a big cleanup on the head of Hopkins creek.

Corbett & Carmichael are piping with a fair head of water at Sawpit, where they have goodground and expect a satisfactory cleanup.

Downieville *Messenger*: At the York mine at the mouth of Slug Canyon nine men are at work driving the main tunnel. The shaft near the mouth of the tunnel is down 75 feet. The mill is running daytimes. A self-feeder has been put in.

Sonoma.

Cloverdale *Reveille*: The work of reopening the Cloverdale quicksilver mine is going on. C. B. & H. B. Lawley are at the head of the enterprise. At present one furnace will be operated, but later a large one will be put in. Two of the old tunnels have been cleaned out. Twelve men are now employed; the number will be increased.

Siskiyou.

Yreka *Journal*: A man named Lewis of Oro Fino has found a ledge above the Sheba mine on Patterson creek, from which he took out thirteen tons, and sold the claim for $5000. He then had the ore crushed, which realized $2000.——The Sheba mine continues to yield $10,000 a month, with a 10-stamp mill.——G. M. Foote has made a strike in the Merrimac mine on Humbug, the quartz showing much gold. Mr. Foote is one of the principal stockholders of the Golden Star mine.——C. Gentry and R. O'Neill are mining near the head of Greenhorn creek, and find good prospects.—— The old Campbell mine, in Quartz valley, is being worked under supervision of A. C. Brokaw. He is piping a 60-foot bank in Felty gulch, and expects to run until the last of July.——Page & Co. are working at the Abe Erno mine in Quartz valley, and have sunk a shaft 70 feet. They are troubled with water, but have pumps and engine. They will have a new boiler to furnish more steam.——Morrison & Carlock are running their mill in Quartz valley day and night, employing twenty men. The quartz is paying.——Thornton & Co., having a bond on the Dave Jones mine at Quartz valley, made an $8000 cleanup for past month and have thirty men employed. ——The superintendent of the Siskiyou hydraulic mine on Klammath river, sixteen miles below Happy Camp, had a $6000 cleanup last month. Twelve to sixteen men are working.——The Minetta B mine, above Happy Camp, Klamath river, is working with two giants. Ten men are employed, with S. Gardner of Oro Fino as Supt.——The Gumboot mine at Scott Bar, bonded by Baker & Co., has sixteen men employed.——F. D. Fraser is operating the old Golden Eagle mine at Indian Creek, with twenty-five men in the mine and six at work putting up a new mill.

Four hundred tons of quartz are on the dump. ——The Grider mine at Selad has been fitted with a new elevator, which has been started. ——Harris & Co., an Oakland company, are wingdamming and sinking a pit at Hamburg Bar, Klamath river, with twenty men.—— Several China claims at Hamburg and several other points along Klamath river are being worked.

Trinity.

Weaverville *Journal*: Fifty flasks of quicksilver constitute the first shipment of the season from the Altoona mines, near Cinnabar. The mines have a normal production of 350 flasks per month.——The Unity M. Co. of New Jersey, Pennsylvania and New York have begun operations on quartz property in the Bullychoop district.

Tuolumne.

Supt. W. R. Dorr of the Boston & Tuolumne G. M. Co., reports that one shaft is down 200 feet on the foot wall of the vein. The other is down 75 feet, in pay ore all the way. A drift has been run from this shaft 50 feet on a vein 7 feet wide, which averages $6 to $8 per ton. A stamp mill is to be erected.

At the Hihapoo mine, on the Stanislaus river near Columbia, Messrs. Reed, Ponce and Day took out a $1000 pocket a few days ago with prospects for more.

Another strike is reported at the head of Deadman's gulch.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—The Nancy M. & M. Co. have completed the new shaft house and have the hoist in place on the Gillard shaft, and will start men sinking Monday. They are putting in a compressor and boiler at the mouth of the Hastings tunnel and have let a contract to drive the tunnel 600 feet or more to the intersection of the Gillard vein, and are putting in a hoist on the Tom Boy. These properties are located at Wall Street.

Wall Street, June 23d, '99.

The Cold Spring M. Co. have bought an eight-drill compressor for work on the tunnel now being driven on the company's property at Gold Hill.

CHAFFEE COUNTY.

The mines of Granite district mostly contain free milling ores, and rich bodies recently opened in several of them have had the effect of increasing operations. The mills are all at work.

CLEAR CREEK COUNTY.

Copper discoveries on Bear creek, near Morrison, and near the Governor Evans ranch, are attracting attention. For years indications of copper have been known, but no effort made to open up the veins. S. E. Roberts of Denver is opening the Boston claim and has a showing of copper. The pay streak is 18 inches wide, having increased from a few inches at the surface. The first tests of the vein matter gave 40% copper. The new belt runs through the lower corner of Clear Creek county, Jefferson and over into Park. A Central City man is working a force on another discovery and has good mineral. A shaft is being sunk. Several men are opening veins near Mount Evans which carry copper and gold. The Bear Creek section is thirty miles from Denver—the nearest mining camp to the capital of the State.

CUSTER COUNTY.

The Bassick mine, at Silver Cliff, is working steadily with ten-hour shifts.

EAGLE COUNTY.

The Iron Mask mine, at Red Cliff, has been equipped with a 22 H. P. gasoline engine and hoist. A small force is working on the mine, shipments having been stopped on account of the closing down of the smelters.

Battle Mountain district shipped fourteen cars of smelting ore recently. The total shipments since Jan. 1st is 138 cars, amounting to 4147 tons.

EL PASO COUNTY.

C. H. MacNeill, vice-president and general manager of the Colorado-Philadelphia Reduction Works at Colorado City, announces that the company has purchased a gas plant which will cost $30,000, and that the company will make its own gas for use as fuel, in place of coal and oil, heretofore used. Other improvements in the reduction plant will bring the total cost up to $50,000. The gas plant will consist of four generators, with a capacity of 50,000 cubic feet per day. The work of putting in the plant will commence in a month. The generators will be placed in a brick addition 50x75 feet, to be built on the south side of the furnace room. The change from coal to gas will save expenses through the fact that thirty-five tons of coal per day will be required to generate the gas which is to be used as fuel, whereas when coal is used for fuel direct, as at present, the daily consumption is fifty tons. This will be the second time that gas will have been utilized as fuel in Colorado, the first time being in the Union mills at Aspen, which have been closed for several years, owing to the drop in silver. Twenty new concentrating tables have also been contracted for.

GILPIN COUNTY.

The water in the California mine has been lowered to the 1500-foot level and is going down at the rate of 3 feet per day. As soon as it reaches the 1700-foot level connection will be made with the Hidden Treasure. The shaft is 2200 feet deep.

During May the Cook mine produced 3400 tons of milling ore, yielding 675 tons of concentrates and 133 tons of smelting ore. The mine is the second producer of the county, the Kansas-Burroughs being the first.

GUNNISON COUNTY.

G. Farnham has made a strike in the Songbird, at Ohio City. He has driven a crosscut tunnel 110 feet and cutting an ore body running $190 to the ton, mostly copper, with some silver and gold.

The Eureka No. 2, in the Quartz Creek district, has opened a vein of decomposed quartz 3 feet wide, carrying values in silver and gold. The tunnel is in 175 feet in porphyry.

The Jessie mine, in the Gold Brick district, is a sample of a grass roots mine. The vein in the breast of a 20-foot tunnel is 10 inches wide, the ore is honeycombed quartz, carrying free gold of an average value of $200 to the ton.

Crystal *Silver Lance*: The machinery for the Cramer concentrator has been taken to Scofield and the treatment of ores will begin in July. Several mines of that section have ore ready for the mill.——The Laura tunnel, which contractors Ford & Kline are driving, is in 380 feet, working two shifts, accomplishing good work.——At the La Plata mine there is a large amount of ore on the dump to be shipped. The first shipment will be made next week. The La Plata is located in Paradise gulch.——At the Black Queen the two pumps have been started to unwater the mine, which will require several weeks.

HINSDALE COUNTY.

Lake City *Times*: Mgr. D. A. Farrell of the Lellie mine, near Lake City, has let a contract for 50 feet of work on the lower tunnel, preparatory to erecting a power plant. ——W. A. Byal, working the Varden Belle under a bond and lease, has three carloads of ore to ship. Assays run in silver and copper. ——G. D. Bardwell, owner and operator of the J. J. Crook mine, Copper mountain, reports the outlook promising. He has copper ore ready for shipment.

LAKE COUNTY.

The first shipment has been made from the new discovery in the Lillian mine on Printer Boy hill, Leadville district. The shipment was thirty tons, running 30% excess iron, seven ounces silver and two-tenths ounce gold. The ore body is 3 feet thick.

The company interested in the Golden Rose mine of Leadville is endeavoring to form a combination with the Matchless, Robert E. Lee and Dunkin mines on Fryer hill. The Robert E. Lee holds the record for the heaviest production ever made in one day from a Colorado mine—$117,000 in seventeen hours, and the Dunkin was one of the big shippers of early days. They will sink for the second contact.

The Home M. Co. of Leadville, was started a year ago with no property of value, but to furnish capital for unwatering the down town mines. The discoveries made in its leases are so rich that the stock now has a market value of $1.75 per share.

The Castle View on Carbonate hill, Leadville, is still shipping ore. It sends thirty tons per day to the Philadelphia smelter, averaging $4.50 per ton.

Leadville *Miner*: The output of ores from Leadville district during the strike was 600 tons per day, including the steel iron shipped to South Chicago, Ill., and the zinc ores sent to Upland, Ind., and to the Vieille Montagne Zinc Co. at Antwerp, Belgium. The ores are from the Moyer shaft. Mr. Colley, Mgr. for Colley & Golob, expects to ship zinc concentrates to Rotterdam, Holland. Trial lots shipped as an experiment have given satisfactory returns.

MONTROSE COUNTY.

It is reported that high-grade silver ore has been found in the Huntsman copper mine in La Sal mountains.

At the Pinto King and Pinto Mammoth, recently bonded to P. McCourt, E. G. Miller and A. L. Searles, located twenty-five miles from Blake, ores have been found that show 10% to 30% copper, sixty ounces silver and $1 to $3 in gold.

MINERAL COUNTY.

The drills from the Last Chance shaft have reached the Amethyst ninth level. The work was done from the eighth level of the Last Chance, and had been going on for five days. It is thought that the mine will be drained completely within four days, excepting about 100 feet, which it is said will be tapped when the water is down to the ninth level.

OURAY COUNTY.

The Calliope mine at Ouray has been shut down pending settlement of the smelter difficulty. During the temporary stoppage, an addition of ten stamps and two tables is to be made to the mill. The old shaft will be pumped out and repaired and work commenced on two veins. A new shaft will be sunk 500 feet from the tunnel and a drift run to the old shaft. When the smelters resume operations, the force will be doubled and work resumed on workings abandoned three years ago.

The richest find ever made in the Bachelor mine at Ouray was made recently. The new shaft has been sunk 100 feet and a drift run 8 feet from the bottom, cutting a body of silver-bearing galena that averages 200 ounces silver to the ton.

PARK COUNTY.

H. Weber, operating the Weber tunnel at Puma City, reports that little has been done in Puma during the last year, but a number of properties are now working and several will be shipping before the close of the season. The Weber tunnel is in 165 feet. Mr. Weber has taken a lease and bond on the Barnaby tunnel, which he will work during the season.

The June, which has been idle for some time, has 75 feet of water in the shaft. Mr. Williams of Oklahoma, the principal owner, has equipped the property with a steam plant and will commence working when the mine is drained, two shifts to be put on development.

The Boomer, which has also been idle, is working two shifts.

PITKIN COUNTY.

Glenwood parties have taken a lease and bond on the Munn tunnel, on Snow Mass, twelve miles west of Aspen. This property carries gold, copper and silver.

A report comes of a rich discovery of copper ten miles north west of Aspen, on the range skirting the north bank of the Roaring Fork. Samples of the ore assayed 45% copper.

SAGUACHE COUNTY.

The Biedell mill at Bonanza is running full time, concentrating five tons of ore into one, with abundance of ore in sight, principally from the Bonanza mine.

SUMMIT COUNTY.

Breckenridge *Journal*: Eighteen months ago Fair & Ferris secured a lease on the Gold Dust, on Little mountain. At first they were compelled to do considerable dead work, but have been shipping ever since the lease was secured. They have the property in shape to produce seventy-five tons per month, with a force of seven men. They have sunk a 150-foot shaft and extended the tunnel on the vein 125 feet. In making this extension of the tunnel, they were following the vein and had some ore, but were 4 feet beneath the large body of ore, which extends along the entire distance, and from which they are now shipping.

TELLER COUNTY.

A strike of shipping ore was made Tuesday by the Princess Alice G. M. Co., when they found 8 feet of gold ore that runs high. The find was made on the Lafayette claim, which is leased and bonded to the Princess Alice Co. for $30,000.

Fifteen different companies in the Cripple Creek district have within a few months installed electric hoists ranging in capacity from 5 to 30 H. P. The Matoa Co. has put in large electric hoists. There will be several other electric hoists put in shortly. Among them will be a 15 H. P. hoist on the O. W. Blackenstaff lease on the Little Pearl; S R. Bartlett will put a 5 H. P. hoist on the Manitou, and F. O. Woods will install a 5 H. P. hoist on the Hendrie. On the Deadwood claim the Con. G. M. Co. will change the 5 H. P. to a 15 H. P. electric hoist. The Anaconda G. M. Co. has purchased a 30 H. P. electric hoist, which has been placed on the Excelsior of that company.

A rich strike on the 600 level of the Moon-Anchor at Cripple Creek is reported.

V. Hemert, leasing on the Ironclad, has opened what is supposed to be a new shoot of ore on that property. From the sixth level at 450 feet he put down a winze 80 feet, crosscut a short distance and found 5 feet of mineral, from which a shipment was settled for at three ounces. A crosscut at the sixth level reached it again.

Victor *Record*: The Pueblo syndicate that recently acquired the Reardon, Hight & Simms lease on the Lonaconing of the Kimberly Co., will make a 20-ton shipment from the drift at the 225-foot level of the mine, which will be marketed in two grades, of which two-thirds will average an ounce and the remainder from $40 to $50 a ton.——On the Old Hickory claim Miliken and others of the Arequa mill, holding the lease, are cutting a station at 200 feet, from which they will drift to the old Bruner workings.

Denver *Republican*: A strike is reported to have been made in the Grace Greenwood, on Gold hill. The property is being operated under lease by the Jerseyville Leasing Co. of Jerseyville, Ill., under direction of J. Birch. The strike was made in the 185-foot level, where an ore body has been cut. The Jerseyville Co. operated a profitable lease on the Mary McKinney and distributed a large sum in dividends. At the expiration of this lease their manager secured a three years' lease on the Grace Greenwood. Part of the old plant was removed from the Mary McKinney and improvements were made at the mine. A shaft and ore house were erected, a force was employed and mineral left by the former lessee was hoisted and shipped; but the returns were unsatisfactory. Mr. Birch decided he was on top of the shoot and commenced sinking.——E. Templeton and associates, subleasing from the Iowa capitalists who are operating the Pride of Cripple Creek, are sinking a shaft on a good lead. The vein has been followed a depth of 27 feet and is 2½ feet wide. Nine tons of quartz, good for 1¼ ounces to the ton, have been saved.——Lessee Selbach will ship forty tons from the Trachyte. The mineral is from the main drift, estimated at two ounces to the ton.——Returns on a carload shipment recently made by the Alert Leasing Co., operating the Diamond, of the Damon Co., give ten ounces to the ton.——The Lexington Co., at Cripple Creek, have commenced work on the Clara D. for the first time in the history of the corporation. The property has until recently been operated on a lease by Horner & Black, who have succeeded in developing a mine and making profits by their investment. The lease has a few months to run and has been acquired for the company, which commenced operations with twenty men. The lessees in May produced ore of a gross value of $8206.——On the Jack Pot the leasing company is curtailing the production of high grade and increasing that of the lower grade ore.——The Los Angeles mine of Cripple Creek has been leased to a company of Montana men, represented by D. P. Glidden. The lease is for two years, the lessees stipulating to sink the shaft 400 feet and expend $25,000 on development during the first year.——A sample taken across 5 feet of mineral in the breast of the drift at the second level on the Lansing, of the Pinnacle Co., at Cripple Creek, assayed 32 ounces to the ton. The ore body in this level is showing up better than above, often being 7 feet in width. A full force is working, numbering thirty men, distributed between the old and new workings. At the new workings a steam hoist has been installed and a shaft house erected. Work resumed in the new shaft with three shifts to connect with the first level run from the old shaft; 40 feet of sinking will have to be done before this connection can be made. A two-story ore house is in course of erection, which will have a capacity of seventy-five tons. Since ore was found in the second level the lessees have marketed six carloads—part from the first level.——Work is to be resumed at the Half Moon. It is understood that the ground opened has been well stoped out and that new lifts will have to be sunk before production on a large scale can be attempted. The shaft is down 580 feet.——Chicago parties have purchased the Bell interest in the Scott & Bell lease on the Teutonic. The shaft has been sunk 60 feet on a promising lease. The first shipment will be made soon.——The Raven G. M. Co. has shipped 125 tons, graded from two to six ounces to the ton. This is the heaviest shipment marketed by this company in some time.——Development work only is under way at the Lillie mine. The force has to be reduced one-half, and no ore is being broken. The mine is on the broad gauge road, and it is understood the management could not arrange for marketing of the product at the mills on this road. The narrow gauge line is now building a switch to the property. The shaft will be put down 200 feet.

IDAHO.

The Moose creek placers, owned by C. P. Richardson, have been mined for thirty-five years. There are 21 miles of ditch with the property. There is a 2½-foot flume, with a 6-inch grade per box. The two giant nozzles are 4 and 2½ inches respectively, washing 40 to 65 feet of old channel gravel. Fifteen men are employed, working eight months per year.

Ten miles from the Moose creek placers are the Montana placers, owned by R. G. Huston of Spokane. He is running a 2-inch and a 4-inch nozzle with a 3-foot flume of 9-inch grade in 12 feet. He has 200 feet of gravel bank.

In the Elk City district, on the borders of the Newsome district, is the Buffalo Hill placer, owned by R. Leggett of Butte. E. L. Dickey is Supt. Near by is the American Hill property, which is under the management of H. Pope. Work is going on day and night. The flume is 3 feet with a 7-inch grade. The work consists of stripping 4 feet of top gravel and the balance is run through a hydraulic elevator.

Spokesman-Review: J. M. Klotz, one of the owners of the Griffith claim on Snake river, reports samples from it to assay $8.26 on the surface. The ledge is 9 feet wide.——D. C. Stevens, operating in the same section, has on the Myrtle on Johns creek a ledge 12 feet wide.——Work is being done on the Crackerjack on the Hump, which is under bond to Clark & Sweeny of Spokane. It is reported that a body of good ore has been struck in that property 30 feet from the mouth of the tunnel.——High-grade copper ore has been found near the Salmon river by J. R. Adkinson. It is a green carbonate of copper, running into a copper glance. The claim is nine miles below White Bird and three miles from Shorty's Bar, on the Salmon.

Boise *Statesman*: Johnson & Summercamp of Weiser have bonded a mine near Banner. A good ledge has been opened and the ore is rich. ——The Idaho Democrat mine, near Hailey, is showing up well. The mine is owned by Watt & Brennan. There is a large body of silver-lead ore which runs high. It has recently been opened. The ore runs 140 to 400 ounces of silver a ton and carries from 40% to 60% lead.

MICHIGAN.

The management of the Franklin M. Co. expects to have the new stamp mill at Grosse Point in operation by July 15th. The mill will have three stamps, each of which, it is estimated, will have a capacity of 400 tons rock per day.

MISSOURI.

A Joplin dispatch says that as a result of the edict issued by the Missouri-Kansas Zinc Miners' Association, about 90% of the mines have stopped work for two weeks. This is the Zinc Miners' Association's method of forcing the smelters to terms. The smelters have refused to pay schedule prices. The miners' association arranged to export 5000 tons of high-grade zinc ore as soon as it can be sacked. This will remove the surplus of unsold ore, and, with a two weeks' shut-down, the miners think they can bring the smelters to time. The smelters have advanced the prices of ore to schedule rates—$43 per ton for 60% ore in the bin.

MONTANA.

Helena *Independent*: There are 300 sacks of ore on the dump at Copperopolis awaiting transportation. The principal portion of this came from the 150-foot level last winter from tunnel work, no stoping having been done.—— J. Devlin and wife and M. E. Reilly have conveyed a five-eighths interest in the Minnie Healey mine to F. A. Heinze for $76,000.—— A new concentrator is being built at Garnet. ——The Bonanza Leasing Co. shipped a carload of ore recently to the East Helena smelters which netted $580.——Butte men have bonded several of the ranches on Gold creek, with a view of putting in steam dredges. It is estimated that the ground and dredge will cost about $80,000.—— Sansberry & Dashley are working a lease on the Shamrock waste dump and producing second-class ore which milled at the Mussigbrod mill $15 per ton, and first-class ore $100 in gold. They have a large box full of water, in the top of which is a screen. The waste is shoveled into the screen and agitated a moment, the fine stuff going to the bottom and the coarse rock is washed and sorted. The leasers are working three men besides themselves, and are making money.

Hamilton *News*: Placer diggings have been discovered on the south fork of the Burnt Fork, across the range and northeast of Hamilton, within Ravalli county. Forty locations have been made. J. Condon made the discovery four months ago. The diggings can be reached from Hamilton by way of the Willow Creek trail. W. H. Brennan, H. W. Johnson, W. P. O'Brien, B. Ferrel, E. A. Chilson and others of Hamilton have taken claims.

Deer Lodge *Silver State*: R. W. Dunlap of Colorado has a bond and lease on a group of placer claims at the head of Dry Cottonwood, fourteen or fifteen miles southeast of Deer

Lodge. The claims are the property of L. Grand Pre, and carry gold and sapphires. The bond is for $5000 and runs till 1900. Mr. Dunlap has gone to the property with supplies. Mr. Grand Pre some months ago leased his upper claim to Gilchrist & Co. of Oregon, who are working the property and have made two satisfactory clean-ups of coarse gold and sapphires.

NEVADA.

In the Con. California mine the work of following the ore in the upraise above the 1750-foot level was suspended Monday in order to enlarge the openings for more extended operations. The objective point in the Con. California mine is the 1800-foot level. The work of reopening that level, through the winze from the 1750-foot level, has been commenced. There has been some delay in pumping operations the past week, owing to irregularity of water for power supplied at the surface.

A 100-ton copper smelting plant is to be installed at Sodaville, Esmeralda Co.

Copper veins are being prospected on Granite creek, twenty-two miles from Golconda. There are fifty men at work there, the Colossus Copper Development Co. of Chicago employing thirty.

C. A. Hitchcock of San Francisco has a bond on the iron mines near Lovelock for ninety days for $55,000.

The new compressor at the Dexter mine, Tuscarora, is to be in operation next week.

White Pine *News*: At the Robust mine another cave has been discovered. It was found in the main drift on the 70-foot level, 80 feet from the shaft, and extends almost to the surface. The cave is 200 feet long and 75 feet wide in the widest place. Its walls are covered with white lime crystals, lined with ore of a high grade.——The mill upon the Star group, near White Pine, has started up and is in full operation. The plant has a capacity of 100 tons of ore daily and is four miles from the mines, the concentrates going to the smelter at Golconda. The company has a steam wagon to transport ores.——It is reported that tests at the Chainman mill are proving satisfactory. The rock will be crushed dry instead of wet, as heretofore. The company has secured the rotary dryer formerly used in the Martin White mill at Ward, and is placing it is position.

NEW MEXICO.

Elizabethtown *Miner*: Good ore has been found in the Tom Boy near Elizabethtown. ——M. & W. Walsh are sinking on a 6-foot vein on their Denver lode.——W. Wells is taking ore from the Little Wonder, on the head of Willow creek.——The new Confidence mill at Elizabethtown will start up. —— S. Mathews has stopped work at the Uraca placer on account of the scarcity of water.

OREGON.

The Wong Back Fawn mines, at the mouth of Sailor creek, have been sold to the Canadian Co., Ltd., of London, Eng., for $16,000. The land includes several bars on the Illinois river, twelve miles south of Kerbey. The Illinois river bars have never been mined, though the tributary streams have been dug over for forty years. The dredge to be used will excavate to a depth of 60 feet and is said to have a capacity of 3000 yards of gravel per day. The sale was made through S. N. Butters, who is interested in placer ground in the vicinity, known as the Hanseth property.

The dredge operating at Weatherby is said to be in successful operation, hoisting 4000 cubic yards daily.

Monroe & Morgan of Seattle, Wash., have bought the Grand Applegate ditch near Medford. It is 12 feet wide at the top, 6 at the bottom, 6 feet deep, 7 miles long. A part of the Squaw Lake mine is to be worked from it this summer.

In Bohemia district it is expected that 300 men will be employed this season.

SOUTH DAKOTA.

Terry *News*: The Buxton Co. is sorting the Big Bonanza dump, shipping two cars a week. ——It is reported that H. O. Alexander and J. Lundberg will work the Big Bonanza under lease.——M. Schnitzel is working the Little Tornado under lease, making three mines he is operating successfully.——The Golden Reward has commenced shipping from the Little Bonanza, the first ore that has been sent from this mine for several months. The Golden Reward Co. has taken charge of the Deadwood & Delaware Co.'s mines and smelter, and the entire business is under the management of the former company, the D. & D. having dissolved. Mr. Blatchford is Gen. Mgr. of the mines.

Custer *Chronicle*: G. L. Millhouse, R. Lewis and M. Daly have discovered a gold-bearing vein three miles northeast of Custer and have located six claims. They are sinking a shaft. The principal claim is known as the Wild Rose. W. Peterson also made a strike near Calamity Peak, on the same belt as the Wild Rose.——The Holy Terror and Keystone mills have started up again, after being idle for two weeks on account of a shortage of wood. ——The Golden Slipper mine, near Hill City, has been bonded to M. E. Pinney. The gold taken from the development work has paid all expenses thus far. —— A group of twelve claims seven miles north of Hill City and two miles south of the Bullion mine, it is reported, are to be sold for $60,000. Development has opened a ledge of free-milling quartz that assays well. The ground has been held for fifteen years by a man named Kimball. It is the intention of the owners to erect a mill.

UTAH.

(Special Correspondence).—The main shaft at the Star Con., near Silver City, is at a depth of 600 feet. At this level a 75-foot drift is being made to cut the ore body which was opened at the 400 level. Since May 24th sixteen cars of ore have been shipped. It is stated this ran from $12 to $15 gold, fifteen ounces silver and 9% to 15% lead. A strike was made by lessees in the old tunnel workings recently which was 15 feet wide, samples of which ran eighty-nine ounces silver, $4 gold and 16% lead.

The Tesora mine, located on Treasure hill, managed by J. T. Hodson, is now equipped with a modern hoist and pumping facilities. The shaft is down 150 feet and sinking is to be continued. This is in a portion of the district containing wet mines. The ores from the Tesora run well in gold and copper.

Silver City, June 22nd, '99. WASCOTT.

(Special Correspondence).—The New Mammoth, near Bingham canyon, in charge of Supt. J. E. Beveridge, is being developed through a shaft and tunnel. The shaft sinks on the vein to the depth of 400 feet from the top of the ridge. From a point on the slope of the hill the tunnel is driving between two parallel veins to connect with the shaft at 550 feet depth. The tunnel is in 600 feet, with 300 feet yet to go. The veins here are from 4 to 8 feet wide, being oxidized quartz, carrying gold values which are to be extracted by cyanide solutions. The company's new cyanide mill is about complete, being equipped with crushers, rolls, eight solution vats, eighty tons capacity each, and is to be operated by electric power from the Jordan Narrows plant. It is expected the mill will start up by July 1st.

The Fortune group, situate near the New Mammoth, is under the management of E. Hill, and has enlarged its development considerably since last year. Its two main tunnels, 64 feet apart vertically, go in 1600 and 1300 feet respectively on the vein, which stands between porphyry and quartzite walls, carrying silver and copper in iron and copper sulphides. One car shipped recently ran 15% copper and fifty-eight ounces silver.

The Highland Boy is producing from 250 to 500 tons of ore per day, delivering same to the railroad over their 12,500-foot wire rope tramway. This company's smelting plant, built near the Jordan river, is operating, though not at its full capacity as yet.

WASCOTT.

Bingham, Utah, June 26th, '99.

Salt Lake men have sold to a Denver syndicate a large tract of placer ground on the San Juan river in southeastern Utah. The consideration was about $250,000. The Denver company intends to work 5000 yards per day.

The Swansea M. Co. during the past fiscal year showed net earnings of $94,451.41, distributed dividends aggregating $65,000 and has a cash surplus of $27,286.11.

R. J. Evans has bought the Ophir claims at Stateline and will organize a company.

W. H. McIntyre has sold his holdings in the Mammoth mine to his brother Samuel for $250,000.

Eureka *Miner*: P. Ryan has arranged to resume work on the Mountain View. Sinking will be resumed, the shaft being down 270 feet.——J. Knight is reported to have purchased for $45,000 of D. Evans a half interest in the South Mammoth, West Mammoth, Black Jack and Trail claims. They are surrounded by producers and traversed by a strong ledge.——It is reported that the Centennial-Eureka property will change hands for $3,000,000. It has paid over $3,000,000 in dividends. Recently deposits of copper and gold ores have been uncovered in virgin ground between the 400 and 600-foot levels, and throughout the mine are bodies of milling ore. A concentrating plant has been considered by the management for several months, but no definite action was taken.

WASHINGTON.

A copper strike is reported on Palmer mountain, Okanogan county. Outcropping copper ledges were discovered there several years ago. The tunnel being driven into the mountain has cut eleven veins. Drifts have been run along five of these and in all of them copper and gold ores were found.

W. M. Darling of Oakland, Cal., is preparing to put men at work on thirty-two copper claims which he and associates have purchased, in the Carbon River district, eighty miles southeast of Tacoma. They have croppings which run in gold and copper. One ledge has a 12-foot vein exposed for 2000 feet.

Spokesman-Review: On the south half of the Colville reservation the tunnel being run on the properties of the Byrne M. & M. Co. on Jackass creek, three and a half miles from Keller, is in 50 feet, and making an average of 3½ feet per day. The lead has the same appearance as where it cropped on the surface, carrying silver, lead and pyrites of copper. The tunnel will be run 400 feet. The company is negotiating for a small smelter. ——The Lloyd properties, adjoining the Byrne group, have an incline shaft down 65 feet. The owners intend to crosscut at the 75-foot level to the footwall, where the best values are found.——Major Gwyder of Spokane, accompanied by F. L. Smith of Riverside, Ill., and G. W. Bentley of Michigan, have been looking over mining property in the Palmer mountain district.——Work has been resumed on the Admiral Dewey at Republic under the management of D. A. Mills. A shaft is to be sunk on the ledge some distance from the old shaft, the new superintendent having uncovered a different strata of quartz.

WYOMING.

Grand Encampment *Herald*: Two discoveries have been made the past week near Grand Encampment, one by the Fleming Bros., the other by Peterson and Tenant. The Fleming property, the Bonanza, is located near the Cushman ranch. The lead does not show at any place above the surface, being covered with soil. At a depth of 2 feet they struck copper sulphide ore. The ore is scattered through jasper 4 feet in width. The Peterson and Tenant discovery is in the same locality, farther west, bordering on the North Fork. The vein is as large as in the Bonanza, with quartz gangue.——Mr. Walters is developing a gold prospect on Cow creek. He has a shaft down 20 feet on a quartz vein carrying sulphide gold ore. It is located on the level prairie four miles north of Grand Encampment.——J. A. Fairchilds has struck copper in the O. K. on North Fork. He has a 20 inch vein carrying copper sulphides.——At the J. Smith discovery, on the plains west of town, the shaft shows the vein widened to 4 feet, carrying copper glance.——Ten men working night and day shifts are working on the Home Fraction shaft. The lead has widened to 7 feet and the rock is stained with copper.——The Copper Glance on Miner creek, owned by G. Garoutte, is beginning to show copper at the end of a 200-foot tunnel.

FOREIGN.

BRITISH COLUMBIA.

The Blackcock Mines, Ltd., a company capitalized at $1,000,000, has been formed to operate the Blackcock mine at Ymir. The directors are: A. J. McMillan, Pres.; A. Julien, Vice-Pres.; C. O. Lalonde, A. Audet, J. L. G. Abbott. No. 1 shaft has been sunk to a depth of 55 feet; the main shaft is down 110 feet. Twenty-five tons of ore went $14.18 per ton, twenty-four tons went $17.88, twenty-one tons went $45.50. Altogether 238 tons have been shipped from the mine with an average yield of $17 per ton.

The Granite and Royal Canadian groups have been incorporated under the name of the Granite Gold Mines. The two groups are among the richest free-milling propositions in the Nelson district. On the Granite three shafts have been sunk. Seventy-one sacks of ore from the Granite vein sent to London assayed an average of $70 to the ton. The average assays taken in the mine show $39.45 per ton. The Royal Canadian group is being developed by three tunnels. No. 1 is in 278 feet, No. 2 is 370 feet and No. 3 is 234 feet. The assays have averaged $16.63 per ton. Sixty-one sacks of ore sent to London returned $58 per ton. It is proposed to erect a 20-stamp mill, for which water power and millsite have already been secured.

Victoria *Times*: A piece of rock which had been lying on a dust-covered shelf in the cabin of Mr. Hawkins, on Cormorant island, was recently assayed, returning $6300 gold and $150 in silver per ton. The rock was taken from a quartz vein discovered by an Indian on Hyde creek, a feeder of the Nimpkish river, six miles from its source. An effort will be made to find the ledge. Prospectors in that vicinity are getting good results from Kingcombe inlet. Assays of ore sent from there went as high as $65 per ton. Numbers of prospectors are searching the shores of the inlets and bays of the northern coast—the majority in small sloops—for ore.

SOUTH AFRICA.

Johannesburg *Mining Journal*: There are rumors in circulation concerning the deep-level farms Diepkloof, Misgund and Olifants Vlei. Inquiry from some of the peggers points to the possibility of mining at a depth of 8000 feet. Another is a belief in the occurrence of reverse faulting on the southern edge of the Klipriviersberg mass of amygdaloidal diabase. A number of claim holders on the northern portion of Olifants Vlei have been offered £1000 apiece for claims.

The Robinson Central Deep shaft is now over 300 feet deep and is estimated to cut the reef between 1500 and 1600 feet. Many of the buildings are nearly ready. Construction work is progressing in every direction, and much of the machinery not immediately essential—such as the battery and the crusher-engine—is arriving. The 100 heads of stamps of this company are to be erected at the Crown Deep battery.

At the Village Deep the west shaft is down over 530 feet and the east shaft 770 feet. The tramline connecting them is complete.

At the Geldenhuis estate operations for the month of April show: Working cost per ton, 17s 4.933d; value of yield per ton, 46s 9.584d; profit per ton, 29s 4.651d; profit for month, £27,308 8s 11d; mine development for month, 103 feet. The Mill—120 stamps ran 29 days 12 hours, crushing 18,585 tons; tons crushed per stamp per twenty-four hours, 5.25; bullion yield, 7199.93 ounces; bullion yield per ton, 7.74 dwts. Cyanide Works—Tons of tailings treated, 12,223; bullion yield, 3191.15 ounces; bullion yield per ton, 5.22 dwts.; working cost per ton treated, 2s 8.97d; concentrates treated, 1400 tons; bullion yield, 930 ounces; bullion yield per ton, 13.28 dwts.; working cost per ton treated, 3s 3.47d per ton. Slimes Plant—Tons treated (current), 4343; bullion yield, 540.81 ounces; bullion yield per ton, 2.49 dwts.; working cost per ton treated, 2s 8.97d; tons accumulated slimes treated, 867 tons; bullion yield, 107.95 ounces; bullion yield per ton, 2.49 dwts.; working cost per ton treated, 3s 4.43d. The small tonnage of accumulated slimes treated is due to bad settling and alterations being made to the treatment vats.

The Crown Reef report for April shows: Number of feet driven, sunk and risen, exclusive of stopes, 461 feet; quartz mined, 21,296 tons; quartz on hand at surface, April 30th, 2980 tons. Mill—Number of days (twenty-four hours) working 120 stamps, 29 2 24; tons crushed, 17,041; tons crushed per stamp per twenty-four hours, 4.874; yield in smelted gold, 8131 ozs. 11 dwts.; equivalent in fine gold, 6985.948 ozs.; yield per ton in fine gold, 8.198 dwts. Cyanide Works—Tons sands and concentrates treated, 14,162; yield in smelted gold, 4244 ozs. 6 dwts.; equivalent in fine gold, 3460.771 ozs.; yield per ton in fine gold, 4.887 dwts; working cost per ton, 3s 2.460d. Slimes Works.—Tons slimes treated, 2689; yield in smelted gold, 491 ozs. 2 dwts.; equivalent in fine gold, 400.258 ozs.; yield per ton in fine gold, 2.977 dwts.; working cost per ton, 3s 5.644d. Profit for month, £25,284 4s 7d. Total working cost, 23s 7.739d per ton; value of yield, 53s 3.833d per ton. Profit per ton, 29s 8.094d. During the month 4113 tons of waste rock were sorted out from the tonnage mined. The waste rock was of an average assay value of 27 grs. per ton. The rock sorted was equivalent to 19.313% of the total rock handled.

Industrial Notes.

—Serious drouth continues in New Mexico and southern Colorado.

—Vladivostock, Siberia, is being superseded in business importance by Port Arthur.

—The San Francisco Mechanics' Institute fair opens Sept. 2nd and closes Oct. 7th, '99.

—Fresno, Cal., papers claim a higher temperature for that town than that of Yuma, Ariz.

—C. Garff of Ogden, Utah, has a municipal lighting contract and will put in an electric light plant.

—A circuit from Mercur to Tintic is the latest plan of the Provo, Utah, Power Transmission Co.

—Tramps are begging for dimes in San Francisco. California farmers are unable to get men to harvest the crops.

—Los Angeles, Cal., has abandoned its project of municipal light distributing, but proposes to issue $2,000,000 water bonds.

—Chicago capitalists are declared to be behind a proposition looking to the formation of a trust in redwood lumber on the Pacific coast.

—Last week the Port Angeles, Wash., Eastern Railway disbursed $12,000 to employes. Work on the line is expected to be completed to Olympia in 1900.

—Electrical engineers and motormen are going from San Francisco to Seoul, Corea, to work on the electrical railroad now being completed in the capital of the hermit kingdom.

—The Alaska-Treadwell Co., Douglas Island, Alaska, will carry its own coal in steel barges and is also credited with intention to establish a home foundry and there make shoes and dies.

—Chicago men are figuring on buying the Colton, Cal., cement works. It has a monthly capacity of 8000 bbls., the wholesale price of which is $2.85 per bbl; eighty men are employed.

—During May the Canadian Pacific Railway sold 39,400 acres of land for $124,800. The Canadian Northwest Land Co.'s sales for the same month aggregated 52,000 acres for $28,500.

—The regular summer rumors of Vanderbilt railroad extension to the Pacific coast now take the form of alleged consolidation of the Chicago & Northwestern, the Union Pacific and the Oregon Short Line.

—Beginning to-day West Australia admits duty free, asbestos covering composition for steam pipes, boilers, etc., gauges and screens for mining and machinery, and appliances for lubricating and cleaning wire ropes.

—A new $400,000 mill is to be erected at Colorado City, Colo. Evidently the trust is not going to have everything its own way in Colorado and Utah. The Pacific coast smelters never were in the trust combine and never will be.

—The Canadian Pacific and Great Northern Railways are reported to have agreed that a joint line shall be laid to connect the Boundary Creek mining camps of British Columbia with the Republic district in Washington, to be thirty-five miles long.

—The South African Customs Union has announced that ad valorem imports which have already paid duty at one port of entry, shall on production of a certificate to that effect from the customs house, be admitted into other parts of the union without the payment of further duty.

—The Yuba Electric Power Co. will put in a plant near Dobbins' Ranch, on the Yuba, Cal., river, capable of developing 15,000 H. P. There is a fall of 700 feet; there will be six 30-inch pipe lines, the lower sections of which will be 2 inches thick and weigh 400 pounds per foot. A. M. Hunt and Wynn Meredith have charge of the installation.

—To-day the Santa Fe system acquires the San Francisco & San Joaquin Valley Railroad, the officers in charge of the traffic of that line will be as follows: E. Chambers, general freight agent, Los Angeles, Cal.; J. J. Byrne, general passenger agent, Los Angeles, Cal.; John Moss, assistant general freight and passenger agent, San Francisco, Cal.

—Public ownership of the San Francisco water is again advocated. Several embryo propositions are made: The El Dorado, Cal., Water & Deep Gravel M. Co. offer a system delivering 35,000,000 gallons of water a day, 100 feet above the city base for $11,950,000 and 450 feet above the city base for $13,490,000—exclusive of the distributing system. A. W. Von Schmidt offers to put in 30,000,000 gallons a day from Lake Tahoe for $13,000,000.

—The News Bureau says: A "Boston concern is shipping insulators to the Pacific coast on a contract—$15,000 for porcelain insulators alone—to carry several miles of wire on one of the largest electric power transmission schemes in the West. These insulators have a heavy groove to carry a No. 2 aluminum wire which will be wholly used in this electric power transmission." In this power transmission scheme there are seventy-five miles of double pole lines, each pole line carrying six aluminum wires.

Recently Declared Mining Dividends.

Tamarack Copper Co., Michigan, $240,000; June 28.

Calumet & Hecla, Michigan, $2,000,000; June 28.

Sacramento M. Co., $5000; July 1. Total $100,000.

Mammoth M. Co., Utah, 20 cents, $80,000; July 1.

Pennsylvania M. Co., Nevada county, Cal., No. 30, 20 cents, $10,300; payable July 3.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JUNE 20, 1899.

627,451.—BICYCLE SADDLE—M. A. Baker, Los Angeles, Cal.
627,454.—PUMP VALVE—C. S. Booth, Oakland, Cal.
627,321.—BOILER—M. P. Boss, S. F.
627,007.—GAS CUT OFF—V. E. Campbell, Winnemucca, Nev.
622,250.—ARTESIAN WELLS—F. Cavallaro, San Jose, Cal.
627,251.—ARTESIAN WELLS—F. Cavallaro, San Jose, Cal.
627,101.—SEWING MACHINE TREADLE—H. Cramer, Sonora, Cal.
627,254.—FRUIT GRADER — Cunningham & Barngrover, San Jose, Cal.
627,257.—ELEVATOR CAGE ESCAPE — Haines & Creighton, S. F.
627,258.—ROPES AND CABLES—A. S. Hallidie, S. F.
627,131.—HOPPLE — T. J. F. Miller, Portland, Or.
627,270.—RAISIN SEEDER—J. B. Rice, Fresno, Cal.
627,209.—BEET PLOW — W. F. Schmidt, Salinas, Cal.
627,276.—BOX—D. F. Sherman, Newcastle, Cal.
627,277.—LETTER FILE—W. Shyvers, Santa Barbara, Cal.
627,270.—PENCIL SHARPENER—J. D. Stassart, Portland, Or.
627,214.—APPLYING INSECTICIDES — J. B. Steele, National City, Cal.
627,360.—TALLYING APPARATUS — C. L. Sturges, Escondido, Cal.
627,282.—MOTOR CARRIAGE—W. E. Twichell, St. Helena, Cal.
627,284.—HAND TRUCK—L. B. Walker, Glendora, Cal.
627,166.—TEA BALL—Caroline A. White, Redondo, Cal.
627,373.—HEATER—C. T. Wise, Sr., New Bridge, Or.
627,315.—PUMP—W. C. Woodward, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAFETY SUCTION VALVE FOR PUMPS.—Charles S. Booth, Oakland, Cal., assignor to the Oakland Iron Works. No. 627,454. Dated June 20, 1899. This invention is designed to provide a safety device by which the inlet valves are prevented from dropping into the pump by reason of its disconnection or breakage of parts, and is applicable to that class of pumps designed to compress air, ammonia, or other gases, or like fluids. It consists of inlet valves having shanks with surrounding collars intermediate of their length; cages centrally bored to guide the valve shanks or stems having annular chambers corresponding with the chambers, these chambers having a length sufficient to admit the movement of the valve in opening and closing. The cages are formed in two segments so that they may be separated by the introduction of the valves and bolts by which they are held after the valves are in place. Suitable springs serve to close the valves after they have been opened by the inwash of air.

ATTACHMENT FOR ARTESIAN WELLS.—Francisco Cavallaro, San Jose, Cal.; one-third assigned to Ignazio Trapani of San Francisco, Cal. Nos. 627,250 and 627,251. Dated June 20, 1899. This invention relates to attachments which are especially designed for use in connection with artesian wells, and particularly that class of wells in which the water does not rise to the surface. It enables the operator to attach devices by which air under pressure can be applied to raise the water within the suction pipe to a point near to or above the top of the well. Interior to the casing of the well is a concentric suction tube with an expansible gasket surrounding it. An annular chamber loosely fits within the well casing and the gasket is mounted upon its upper side. A conical expander fits within the gasket, and mechanism is applied by which to move the expander to force it into the gasket or withdraw it therefrom. By means of air pipes extending down exterior to the suction pipe and through the closure into the space below, the pressure of air can be applied which will cause the water to rise by displacement until it stands high enough to be reached by the pump.

MACHINE FOR MANUFACTURING ROPES OR CABLES.—A. S. Hallidie, San Francisco, Cal. No. 627,258. Dated June 20, 1899. This invention relates to the manufacture of wire ropes and cables and a means for shaping the individual strands so as to present a larger surface to the parts with which they come in contact such as the grooves of pulleys or wheels over which they may pass. It consists principally in the employment of compressing rolls by which the individual strands are compressed and flattened into shape in spiral lines and then laid up to form the rope without being themselves twisted. The spiral formation coinciding with the lay or twist of the rope, the drawing-off mechanism controls the operation of the compressing mechanism so that they act in unison, and when the cable or rope thus made is laid up, the outer surface will have a curvature dependent upon the diameter of the rope with a very small proportion of interstices such as are found where the ordinarily formed strands are laid up into the rope without other treatment.

ELEVATOR CAGE ESCAPE.—Byron W. Haines and Wm. D. Creighton, San Francisco, Cal. No. 627,257. Dated June 20, 1899. This invention relates to an elevator attachment which is designed to facilitate the escape of inmates therefrom if the elevator should become fixed at points intermediate between the regular floors or landings and in other positions of peril. It consists of a ladder section pivoted with relation to a track which is formed in the upper part of the cage and so disposed that in case of necessity the trap may be closed and the ladder connection availably placed so that the inmates of the cage can escape at the top, and in connection with this may be a supplemental ladder from the top of the cage which will reach to a point of escape from the elevator shaft or well. These devices are so arranged that under ordinary conditions the cage will be normal without any special appearance of these attachments, but they can be instantly brought into use when needed.

MOTOR CARRIAGE DRIVING MECHANISM.—Walter E. Twichell, St. Helena, Cal. No. 627,282. Dated June 20, 1899. This invention comprises an improved means for transmitting power from the main driving shaft of a motor to a supplemental or countershaft and a means for transmitting the power from this countershaft directly to the wheels to be driven, also mechanism for reversing the apparatus when required. The vehicle wheels are turnable upon their axles, the rear axle being fixed and the front one having short spindles hinged to it so that the front wheels are turnable with these spindles. Power is transmitted from the countershaft to sprocket wheels on the forward wheel hubs and the chains pass over grooved direction pulleys so that the direction of the chains from the countershaft sprockets to the wheel shafts is changed without the interposition of any other mechanism or wheels. A peculiar arrangement of sinuous curved yokes is employed with connecting pitmen reciprocated thereby and arms diverging from the pitmen ends, links with which the opposite ends connect, and rack bars connected with and reciprocated by the arms. The movement of the rack bars is transmitted through pinions and a pawl and ratchet mechanism which converts the reciprocating into a continuous rotary motion.

FRUIT GRADER.—L. Cunningham and H. M. Barngrover, Los Gatos, Cal. No. 627,254. Dated June 20, 1899. This invention is designed for grading of fruits of various kinds, such as prune plums and other drying fruits. It consists in the combination of a plurality of separable frames disposed in line and provided with chutes. Independent shaking screens are fixed above the frames with openings of progressively increasing size. Hangers serve to pivotally suspend the outer ends of the frames, and means are constructed by which the connection between the frames and the power devices can be made or broken. Suitable grading compartments are arranged with relation to the screens so that the various sizes can be collected therein, and means by which the operation of grading can be readily inspected. The screen frames can be detachably connected with each other without disturbing the action of either and by means of turnable direction boards the product can be directed to any desired point.

Personal.

W. LAWSON is now analytical chemist for the Alameda, Cal., Sugar Co.

W. F. JOHNS, Supt. Plumas-Eureka mine, has returned from Reno, Nev.

CAPT. WM. JAMES left Johannesburg, S. A., June 5th, en route to Redding, Cal.

A. M. HUNT is now Gen. Mgr. Independent Light & Power Co. of San Francisco, Cal.

COL. D. H. JACKSON has begun development work at the Darling mine, Placerville, Cal.

FRANK JONES is now Supt. of the reduction works of the Anaconda Copper Co., Montana.

GEO. D. BURTON of the Electric Mining & Reduction Co. is still experimenting at Oreana, Nev.

W. N. HESKEY of San Francisco, Cal., is in Arizona making examinations of Copper Mountain property.

DR. MOLENGRAAF, State Geologist of the South African Republic, is investigating glacial phenomena in that region.

A. G. CAMPBELL, owner of the St. George and other mines at Vanderbilt, Cal., has gone to Deer Lodge, Mont., where he has mining interests.

LIEUT. G. W. MCELROY comes from Washington, D. C., to the Union Iron Works, San Francisco, in connection with the construction of the battleship Wisconsin.

CONGRESSMAN DEVRIES of Stockton, Cal., is part owner in the Lucas mine, Mokelumne Hill, Cal., in which has recently developed some remarkably rich ore.

GEORGE MITCHELL, formerly smelter Supt. at the United Verde mines at Jerome, Ariz., is interested in a company which is erecting a smelting plant eighteen miles south of Bisbee, Ariz.

MESSRS. TAYLOR AND O'DONNELL of Denver, Colo., are looking for nickel in Nevada and Utah, and are locally credited with intention to enlist Boston capital in the development of the Lovelock, Nev., nickel deposit.

CAPTAIN PETER H. SCOTT and Mr. Conrad Hansen, both well-known master millwrights, left Denver for the sunny South last week, to superintend the erection of plants built by the Edward P. Allis Co. Captain Scott has gone to Dahlonega, Georgia, to put up a 120-stamp mill, and Mr. Hansen to southeastern North Carolina, to put up a similar plant, though of a smaller size.

RICHARD A. PARKER of San Francisco, Cal., consulting engineer of the United States M. Co., and Bert Holden, the managing director, are at Bingham in conference with Supt. J. W. Neill regarding equipment. A large power plant in the Jordan canal is contemplated. It has now been determined that reduction works will not be built this season. Mr. Parker is expected to return to San Francisco, Cal., next week.

Commercial Paragraphs.

CHAS. H. FIELD of the Risdon Iron Works, San Francisco, Cal., will build a 10-stamp mill at the Maiden's Dream mine, Granite district, Baker Co., Oregon.

GEO. O. BRADLEY, Salt Lake manager for the Gates Iron Works, reports the shipment of crushers, rolls and jigs to Anaconda, Mont., for the concentration mill of the Anaconda Copper Co. The old steam stamps are to be taken out of one section of the mill and supplanted by the machinery named.

THE Pacific Tank Co., 35 Beale St., S. F., and 348 E. 2nd St., Los Angeles, Cal., recently furnished a twenty-five-ton cyanide plant to the Warrington mine, Havilah, Cal., a plant of fifty tons capacity to the Jackson & Lake View M. Co. at Lundy, Mono Co., Cal., and a ten-ton plant to Six-Mile canyon, Virginia City, Nev., the latter operated by Messrs. Moore & Fisher.

AMONG recent shipments made by the Union Gas Engine Co. was one Union hoist and one stationary engine to Progresso M. Co., Mexico; two 15 H. P. Union hoists to M. P. Boss, City of Mexico; one 40 H. P. hoist to the Tenabo M. & M. Co., Nevada; one 10 H. P. hoist to the Sidewinder mine, San Bernardino Co., Cal. There will soon be shipped by this company to the Yellow Aster M. & M. Co. at Randsburg, Cal., a 130 H. P. Union hoist, believed to be the highest power gas engine plant for mine hoisting so far put out.

THE Westinghouse Type "C" electric motor has an established reputation as a standard machine. It is employed extensively in the U. S. government navy and in naval yards. This motor is absolutely sparkless, and can be safely operated in powder mills, grain elevators, paper mills, and wherever inflammable and explosive material is present. At the Indian Head proving grounds, in the U. S. government factories for smokeless powder, Westinghouse Type "C" motors are largely used. The Silver Spring Bleaching & Dyeing Co., Providence, R. I., have recently ordered several Westinghouse Type "C" motors as an addition to their plant, which already uses a considerable number. The Kia Ora Gold Dredging Co., Oroville, Cal., have ordered a number of Westinghouse motors; one of 50 H. P. will operate the dredge, others will be used for centrifugal pumps and rocking the washing trays. The electric current to operate the motors at Oroville is transmitted from Butte creek, twenty-three miles distant. Water turbines generate the current. The Bedrock Dredging Co., Boise, Idaho, are extensive users of Westinghouse electric apparatus for generating current and carrying on the dredging and gold washing processes. The Marigold Dredging Co. are also largely using Westinghouse electric apparatus for dredging; a 75 H. P. and a 50 H. P. Westinghouse Type "C" motor are employed to operate dredges and pumps. A further order for several motors for the Marigold Dredging Co. has recently been received by the Westinghouse Electric Manufacturing Co. Nikola Tesla has ordered a small Westinghouse Type "C" motor to be dispatched to Denver, Colo., for use in his laboratory. The Telluride Power Transmission Co., Colo., have ordered a 75 H. P. Westinghouse Type "C" motor to operate part of their plant. The Continental Tobacco Co. have added to recent large orders for electric apparatus five more Type "C" motors for their Danville, Va., factory. The American Tobacco Co. have contracted for four more motors to be dispatched to their Durham, N. C., factory.

Catalogues Received.

"Roasting, Smelting, Refining Methods, Machinery," 4th edition Catalogue No. 3; Fraser & Chalmers, Chicago and London; 168 pages, heavy plate paper, artistic halftones and line engravings, descriptive matter; everything up to date; worth reading. Send to Fraser & Chalmers, Fulton and Union Sts., Chicago, Ill., and get a copy.

School of Engineering Graduates.

The Van der Naillen School of Engineering, 933 Market St., San Francisco, recently completed its thirty-fifth year. Following is a list of the graduates:

Mining—A. R. Gurrey, Shasta, Cal.; E. Matteson, Nevada, Cal.; F. J. Kellett, St. Helena, Cal.; H. G. Moss, Orange, Cal.; J. L. Stubbs, Lower Lake, Cal.; J. F. Williamson, Seattle, Wash.; I. L. Ryder, San Jose, Cal.; R. P. Turney, Campbell, Cal.; C. P. Christensen, Randsburg, Cal.; O. R. Lawson, Gold Hill, Nev.

Surveying — H. Koenig, Oakland, Cal.; George B. Kearney, Santa Barbara, Cal.; Paul E. Lepoids, Los Angeles, Cal.; E. H. Bushong, George Colbert, San Francisco, Cal.; E. W. Nolan, Callahans, Cal.; G. Winter, Yolo, Cal.; F. W. Saunders, Empire City, Or.; E. B. Olney, Chico, Cal.; C. S. Winter, Berkeley, Cal.; J. R. Myers, Honolulu, H. I.; C. A. Call, Fort Bragg, Cal.; Carl G. Bell, Colfax, Cal.

Assaying—W. S. Lauritzen, San Jose, Cal.; H. T. Ledgley, Siskiyou, Cal.; A. M. Thompson, E. L. Howard, A. Campbell, S. T. Parks, H. F. Lyon, E. M. McNaught, San Francisco, Cal; W. H. Irwin, Oakland, Cal.; A. C Turney, Virginia City, Nevada; M. Jones, Paris, Ill.; G. M. Rolph, Grass Valley, Cal.; J. M. Landis, Callahans, Cal.; R. C. Hicks, Corning, Cal.; W. S. Pascoe, Mexico; George J. Probasco, Baker City, Or.; G. H. Call, Fort Bragg, Cal.; C. B. Volkert, Dyea, Alaska; H. G. Siskron, Lower California.

Electrical Department—D. M. McVean, A. Gilmartin, C. E. Severeen, G. H. Wadman, Charles R. Forge, J. G. Finley, W. J. Shea, J. F. Galvin, M. Johnson, William Mullan, Martin Johnson, C. Brown, P. J. Concannon, A. E. Daniels, A. Thomas, C. M. McIntyre, C. F. Nelson, F. A. Brenner, P. Norton, J. Peacock, J. Fuite, F. J. Walsh, Roy H. Craig, Enos Woods, C. P. Hunt, San Francisco, Cal.; William Bulson, Stockton, Cal.; R. E. McDanil, Cresswell, Or.; E. H. Lowe, Knights Ferry, Cal.; E. M. Cleary, Oakland, Cal.; R. H. Cunningham, Arizona; A. McLukie, New Zealand; H. W. Riblet, Sonoma, Cal.; H. C. Hasselbach, Biggs, Cal.; G. B. Von Boden, San Jose, Cal.; H. Bernhardt, Oakland, Cal.; P. Donelon, Sacramento, Cal.; J. Ponnott, Seattle, Wash.; J. W. Reay, New Zealand.

Recent Mining Incorporations.

Cherokee Gravel & G. M. Co., Soulsbyville; capital stock, $300,000; W. K. Fletcher, J. H. West, J. W. White, E. G. Dell, H. K. Fletcher.

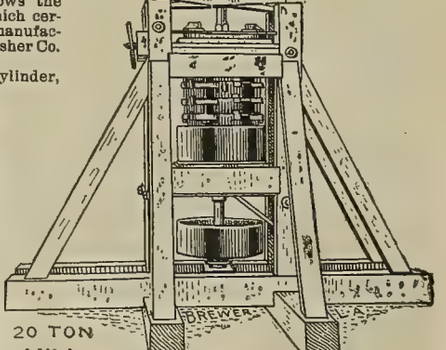
Illinois & Josephine M. Co., San Francisco; capital stock, $20,000; B. F. Gilman, J. J. Scrivner, H. A. Griffin, D. B. Richards, J. C. Sullivan.

Placer Oak South Extension M. Co., San Francisco; capital stock, $100,000; W. E. Mies, R. S. Moore, D. J. Staples, J. Mason, J. J. Mason.

Herron Hill Oil Co., Los Angeles, Cal.; capital stock, $50,000; R. H. Herron, G. C. Orr, F. S. Herron, R. E. Sinell, C. H. Farland.

Mercy Oil Co., Fresno, Cal.; capital stock, $200,000; J. J. Mercy, G. Herminghous, G. L. Hoxie, S. McKay, M. K. Harris.

San Joaquin Oil Co., Hanford, Cal.; capital stock, $50,000; W. J. Garner, G. E. Garner, J. E. Garner, R. F. Covert, J. G. Covert.



Eureka Oil & Gas Co., Hanford, Cal.; capital stock $500,000; subscribed $100; A. R. Orr, D. S. Fish, W. W. Parlin, M. J. Newport, W. B. Charles.

Southern California Marble & Lime Co., San Bernardino, Cal.; capital stock $100,000; subscribed $500; B. H. de Jersey, F. W. Armitage, H. Ingram, H. O. Maynard, H. F. Bradburn.

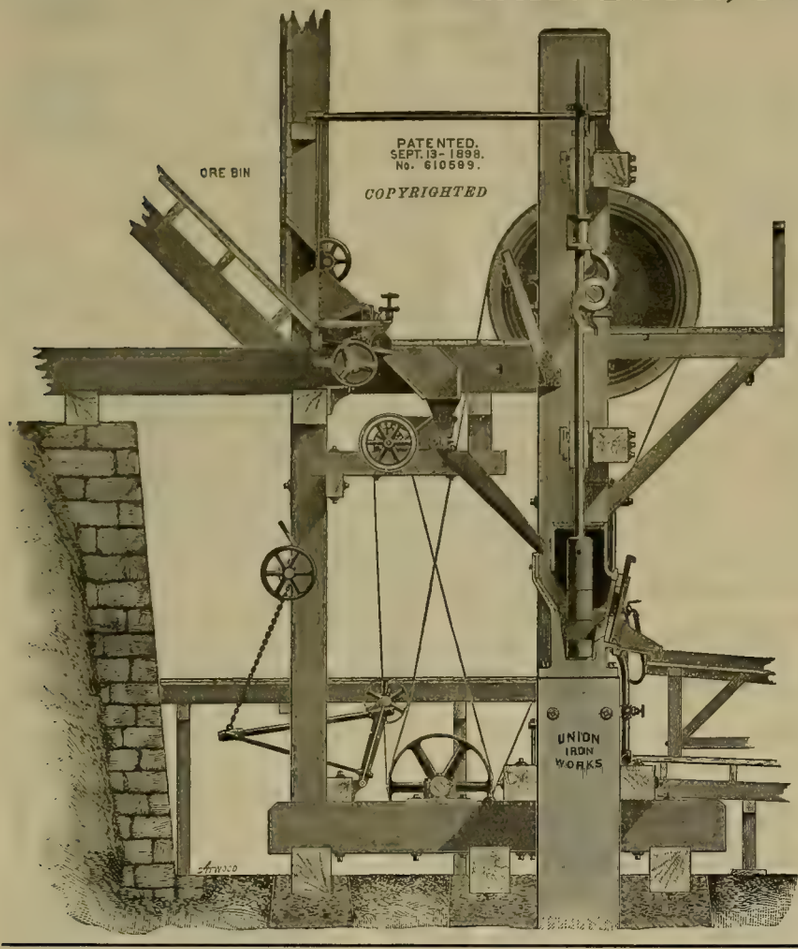
Stanley Oil Co., Fresno, Cal.; capital stock $200,000; subscribed $110,000; E. R. Snyder, E. Vogelsang, E. Kreyenhagen, H. Kreyenhagen, H. L. Chadwick, J. M. Hendrickson, R. H. Herron.

Mystic Rotary Quartz Crusher.

The accompanying illustration shows the Mystic rotary quartz crusher, for which certain advantages are claimed by the manufacturers, the Mystic Rotary Quartz Crusher Co. of Los Angeles, Cal.

This crusher consists of a cone and cylinder, mounted on a ball-bearing, and revolved by a square shaft passing through the cone loosely. The power is applied directly to this shaft. The outside and inside of the mill revolve in the same direction, at the same rate of speed, thereby avoiding any friction or grinding—reducing the wear to a minimum. The cone is slidably mounted on the shaft, which permits the wearing parts to approach each other, thereby taking up the wear automatically.

There are a number of these mills at present in operation at various points in California, both for cyanide and for dry concentrating; also wet for amalgamating. All are giving great satisfaction, and the owners are speaking in the highest terms of them and could not be induced to adopt any other system of crushing.



The ore can be fed to the mills right from the mine, without going through a rock breaker, the mill taking the rock as large as an ordinary rock breaker and reducing it to pulp instantly.

The cost of crushing ore by this mill is much less than of any other known process, the wear and tear being nominal. The pulp is taken from the mill by an elevator and carried to screens on top, the coarser material returning to the mill, and the pulp going by gravity to whatever point desired. The mill is well balanced, runs smoothly and makes no noise. It can be framed in with the ore bin, if desired. Pick points or broken drills will not injure the mill in any way. Mills can be framed together in battery form to any desired capacity; 100 tons, or 50-stamp size, occupying a space of about 4x20 feet. The actual horse-power consumed will not exceed one-half H. P. per ton of ore crushed, and when a number of mills are running the power required will be much less.

This mill is put up in Los Angeles, Cal., by the Mystic Rotary Quartz Crusher Co., with main office at No. 132 South Broadway. *

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

15C-2

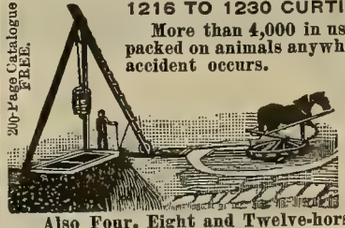
SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ¼ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.



Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

THE GUTTA PERCHA RUBBER AND M'F'G CO.,

30 and 32 FREMONT STREET. Telephone Main 1813. SAN FRANCISCO, CAL.

THE J. H. MONTGOMERY MACHINERY COMPANY.

1216 TO 1230 CURTIS ST., DENVER, COLO., U.S.A.

More than 4,000 in use. Made of wrought iron and steel. Can be packed on animals anywhere. The deadlock holds the load when an accident occurs.

Price of One-Horse Whim, complete, with shieves..... $90.
Two-Horse Whims, complete, with shieves..... $150.
Pumping Attachment with Pipe for either..... $40.
Blower Attachment with Pipe for either..... $30

Also Four, Eight and Twelve-horsepower Whims.

For Valves, Whistles, Lubricators, Oil Cups, Grease Cups, Oiling Devices, Brass and Iron Steam Specialties,

Go to Headquarters.

ALL goods bearing the name "Lunkenheimer" are warranted first-class, and endorsed by intelligent steam-users everywhere. Specify Lunkenheimer make. Our catalogue will post you. Write for one.

The Lunkenheimer Company,

BRANCHES: NEW YORK, LONDON. GENERAL OFFICES AND FACTORIES: Cincinnati, U. S. A.

PROPOSALS ARE INVITED FOR THE CONstruction of a pumping plant and pipe line at Minas Prietas, Sonora, Mexico. Length of line, about 16¼ miles; delivery 275 feet higher than intake; capacity 300,000 gallons per 24 hours, with margin to allow of increase to 600,000 if required; pumping plant of sufficient power to do work required with most economical use of steam, and pipe of suitable strength to allow a safe margin over pressure it may be called upon to stand. Contract for material and installation will be let as a whole, or separate contracts will be made for furnishing material and installation, as the company may determine. For further information, profile of line, etc., address W. T. BARRETT, Minas Prietas Water Co., Torres, Sonora, Mex.

Tenders for Placer Mining Claims on Dominion Creek, in the Yukon Territory.

SEALED Tenders addressed to the undersigned and marked on the envelope "Tender for a placer mining claim" will be received at this Department until noon on Friday, the 1st day of September, 1899, for placer claims and fractions of claims on Dominion Creek reserved for the Crown.

The following is a list of the numbers of the claims and fractions and the approximate frontage thereof as surveyed by Messrs. James Gibson and R. W. Cautley, Dominion Land Surveyors:

BELOW UPPER DISCOVERY.

No.	Length in ft.	No.	Length in ft.
1A	5	10A	33.3
2A	19	15A	42.25
3A	30.5	31A	43
8A	87.4		

ABOVE LOWER DISCOVERY.

No.	Length in ft.	No.	Length in ft.
1A	13	6A	35.00
2A	59.1	10A	143.25
4A	1.25		

BELOW LOWER DISCOVERY.

No.	Length in ft.	No.	Length in ft.
1A	56.3	75A	24.7
2A	7.2	76	500.
2C	20.3	77	449.8
8A	34.00	16C	033.3
9A	39.25	18A	164.7
11A	98.4	78A	3.6
13A	68.5	80	451.3
16A	40.25	81A	15.3
20	202.1	83	500.
21A	71.9	84	500.
22	500.	85	500.

36	500.	93	500.
37	500.	94	500.
38	352.	95	500.
68A	94.7	96	500.
69A	40.5	97	500.
70A	72.6	98	500.
71	414.4	99	500.
73A	12.3	100	478.7
74A	21.3	101	119.

Each tender shall specify the numbers of the claims and fractions tendered for and also the amount of bonus offered for each claim and fraction. The tender may be for the whole lot or any one or more of the claims and fractions and must be accompanied by an accepted cheque in favour of the Minister of the Interior for ten per cent of the amount offered, one-half of the remainder to be paid into the Department of the Interior at Ottawa or to the Commissioner of the Yukon Territory at Dawson within thirty days from notice of acceptance of tender, and the balance within six months thereafter with interest at the rate of four per cent per annum.

Entries for the claims and fractions will be granted in accordance with the Placer Mining Regulations on acceptance of tender.

The entries will be subject to the usual royalty and the provisions of the said Regulations from time to time in force, except as to representation provided for by Clause 39, which will not be required.

The claims and fractional claims for which entries may be granted shall not include any portion of the beach or hill claims for which entry may have been previously granted.

The highest or any tender not necessarily accepted. JOHN R. HALL, Secretary.

Skeleton Mining Report.

NEEDED BY EVERY MINING MAN.

FIFTY CENTS POSTPAID.

Mining and Scientific Press, 330 Market St., S. F.

Mining and Mechanical Engineer of twenty years' experience desires engagement, for family reasons, in locality below an altitude of 6500 feet. Mining and concentration a specialty. Address "Concentrator," care Mining and Scientific Press.

Mining Superintendent, Assayer and Millman

of twenty years' experience wishes position. Eight years at last place. Best of reference. Address A. J., care Mining and Scientific Press.

Wanted Situation,

AS DRAUGHTSMAN or **Assistant Chief Engineer** by a graduate of Zurich Polytechnic, Switzerland, in mechanical and electrical engineering; has a few years shop and board experience; speaks English, German, French and Holland Dutch. Address "M," P. O. Box 720, Hartford, Conn.

MINING ENGINEER,

with eighteen years' practical experience in all branches of mining work, wants position as superintendent, assayer, surveyor or bookkeeper. Address "Cupel," care Mining and Scientific Press.

AN ACCOUNTANT

Of seven years' experience with mining company desires a position in any country. Good references. Address C. G., this office.

WANTED POSITION as Timberman, Tool Sharpener or Mine Foreman by steady, competent, conscientious man. Experienced in all lines of underground work. Highly recommended by former employers. Address W. B., this office.

Mining Properties,

GOLD AND COPPER.

J. N. ROSA, BOX 5,.....SHASTA, CAL.

MACHINERY — FOR SALE OR LEASE, all or half interest in the Cripple Creek Machine Shops and Foundry. This is the largest and best equipped plant in the district; or will trade for good mining property or stocks in the Cripple Creek district. Party must be practical and competent to take charge of and manage the business, as owner is giving his attention to mining. Address the Cripple Creek Machine Shops, Cripple Creek, Colorado.

FOR SALE.

One 150 H. P. Corliss engine, in first-class condition; size of cylinder, 18x48. Also, one Buckley condenser. For particulars, apply O. N. B. & C., P. O. Box 2096, San Francisco.

FOR SALE,

Second Hand 3-Inch Compound Centrifugal Pump.

GOOD AS NEW—$80.

Address PUMP, Box A, care of this office.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.

For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

Mines and Machinery for Sale at Public Auction.

The Harqua Hala (Arizona) Gold Mining Company will on Monday, August 14th, 1899, at 12 o'clock noon of that day, at the Court House door at Yuma, Arizona, offer for sale to the highest bidder all its mines, mill site, pumping plant, 40-stamp mill, cyanide plant, engines, boilers, machinery (fixed and movable), and stock of merchandise situated at Harqua Hala, Yuma Co., Arizona. Inventories and information may be obtained from C. Dallman, agent at Harqua Hala, or Lindley & Eickhoff, attorneys, 530 California St., San Francisco. Terms of sale: Cash, U. S. gold coin, payable twenty per cent on acceptance of bids, balance on delivery of possession. Title to mines U. S. patents. By order of the Board of Directors.

..CRIPPLE : CREEK..

FOR SALE—CYANIDE PLANT,

100 tons daily capacity; in first-class condition to handle Cripple Creek ores.

Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

THE BLAZED PATH.·.

IS A GOOD ONE TO FOLLOW.

The money-making manufacturers advertise in this paper with most successful results. Results are what count.

You can buy advertising space for less money elsewhere, but you can't buy a CHEAPER advertisement. Cheapness is not regulated by what you pay, but by what you get for what you pay.

In the MINING AND SCIENTIFIC PRESS you reach over 25,000 probable customers fifty-two times a year.

No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

KEYSTONE DRILLER CO., Beaver Falls, Pa.

Dewey, Strong & Co., Patent Agents,

330 Market St., San Francisco, Cal.

THE BRYAN ROLLER QUARTZ MILL.

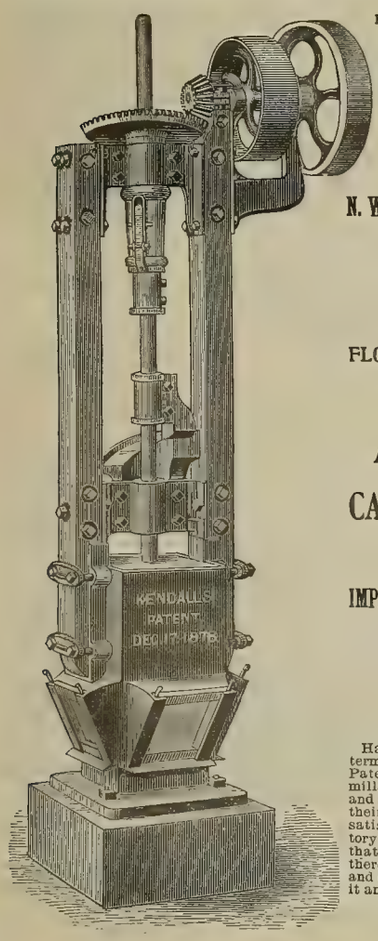
We are the sole manufacturers of this Mill. A test made by the Bullion-Beck Co. of Eureka, Utah, with this and the Huntington Mill proved conclusively every claim we made for the Bryan Mill, viz: that the Bryan would crush more ore with less repairs, less power and less slimes than any Mill made. Result — they are now operating three of the five-foot Bryan Mills and find them superior and more satisfactory than any Mill they ever used. L. C. Trent & Co., who had formerly sold the Huntington Mill, immediately manufactured a Mill infringing our patent. Suit brought in the U. S. Court resulted in a verdict in our favor, and we shall prosecute to the full extent of the law any infringement of any character whatsoever in the MAKING, USING or SELLING of the same. : : : : : : : : : : :

Strong.
Economical.
Simple.

MANUFACTURED BY

The BRYAN MILL is constructed on the principle of the Chili Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post. We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. : : : :

Send for Catalogue No. 8



THE RISDON IRON WORKS, Beale and Howard Sts. SAN FRANCISCO, CAL., U. S. A.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: GATES IRON WORKS, Dept. UU, 650 Elston Ave., CHICAGO.

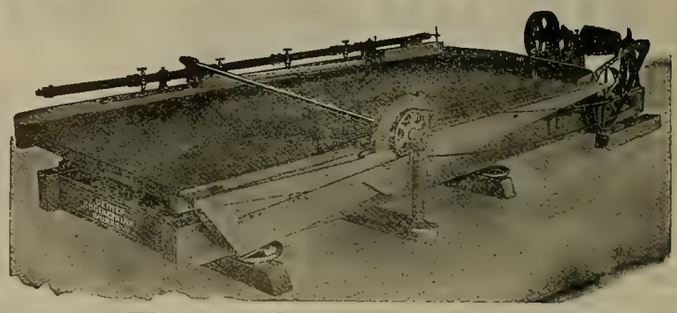
MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

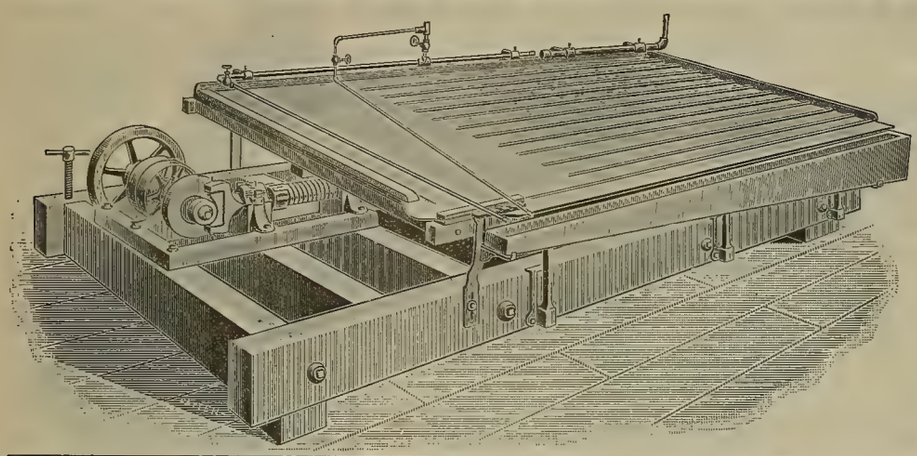


MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : : :



The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : : :

Thoroughly Protected by Strong Patents. Write for Circular.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

30th and Blake Streets, - - - - DENVER, COLORADO.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

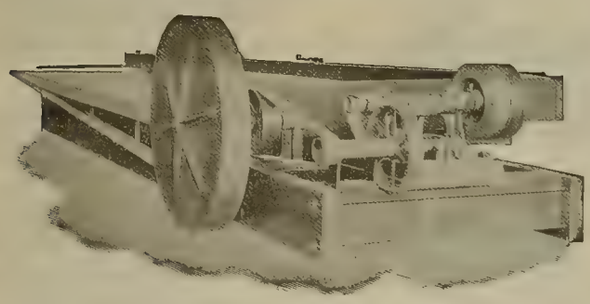
SIMPLE IN ITS CONSTRUCTION. | SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. | CAPACITY FROM 5 TO 10 STAMPS.

GEORGE E. WOODBURY,

Send for Catalogue. No. 141-143 First St., San Francisco, Cal.



WHITE, ROGERS & CO.,

Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

Market Reports.

SAN FRANCISCO, June 29, 1899.

SILVER.—London, 27 11-16d; New York, 60¼; San Francisco, 60¼; Mexican Dollars, 49¾@50¼; New York exchange, sight, 12½; telegraphic, 15 cents premium.

LEAD.—New York reports very quiet, $4.45 bid, $4.50 asked; brokers' price, $4.25.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6½c; bar, 6.50c.

COPPER.—New York reports Lake unchanged at $18 bid, $18.50 asked; brokers' price, $18.25; mill copper plates, 23½c.

Copper remains dull and practically unchanged. The demand for the metal is maintained regardless of high price, and the output has not shown large increase.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—12½@13c per pound.

TIN.—Quiet, $26 bid, $26.15 asked; pig, 31c per lb.; Bar, 35c. New York weak, $23.35 bid, $25.50 asked.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $43; export, $39.00 @39.50; carload lots, special rates.

The steady and profitable production of quicksilver in California has had the effect of reopening several old mines which for years had been idle. The universal interest in metal m ning has also stimulated the industry somewhat, no doubt.

PLATINUM.—London, 63½s per ounce; York, $16.25; San Francisco, $16.75.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¾c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$7 50	Cumberland	$9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd..	14 50	Welsh Anthracite.	12 50
Scotch	8 00	Rock Springs	7 60

COKE.—Foreign, $13; domestic, $12 per ton.

CHEMICALS.—Cyanide of potassium, jobbing, 32@33c per lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 4½@5c per lb.; borax, refined, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¼@1½c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 14c; chlorate of potash, 25c; caustic potash, 12c.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5½c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7½c; 6s, 10 oz., 6½c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

OILS.—California Castor, pure, cs., $1.08 per gal.; bbl., $1.03; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.15; less than 200 gals., $1.10; in bbls., 4c per gal. less than case; Baker's Crystal, $1.40; China Nut, 50c; Linseed, strictly pure, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 47c; cs., 52c; raw, bbl., 45c; cs., 52c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 16¼c; Astral, 16½c; Star, 16½c; Eocene, 18½c; Extra Star, 20½c; Elaine, 21½c; Water White, bulk, in tanks, 11¼c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21c; 86 deg. Gasoline, bulk, 21c; do., cs., 26c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 20½c; Lard Oil, Extra Winter Strained, bbl., 52c; cs., 57c; No. 1 bbl., 46c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 70c; No. 1 bbl., 50c; cs., 52½c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

Hercules Gas Engine Works.
San Francisco. Cal.

DEAR SIRS:—

The fifteen-horse power gasoline engine and hoist purchased from you is doing fine work and is perfectly satisfactory in every respect.

Yours truly,

TUOLUMNE MOTHER LODE M & D. CO.,

Per N. W. Moodey, Pres.

We have two large books full of testimonials; they speak better for the HERCULES than we can. Our works are the largest in the country. We have built and sold over 3500 engines; they are the standard everywhere. Any size up to 200 H. P. Stationary, Hoisting and Marine.

Hercules Gas Engine Works,

305 MARKET STREET, SAN FRANCISCO, CAL.

THE

Pelton Water Wheel Company

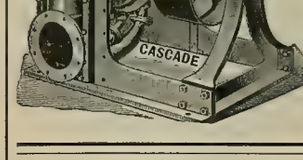
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.



The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.

DELINQUENT SALE NOTICE.

THE MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 18) levied on the 9th day of May, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Marcus Schwab	64	500	$50 00
Kath. Emhoff	93	500	50 00
H. Helfrich	166	250	25 00
Mrs. M. L. Faas	209	5	50
Peter Krucke)	232	62½	6 25
J. Beck	243	62½	6 25
Andreas Kruckel	251	100	10 00
John C. Lutz	265	200	20 00
Chas. Riegert	274	100	10 00
H. Helfrich	295	100	10 00
John C. Lutz	318	100	10 00
John C. Lutz	335	100	10 00
Adam Miller	350	125	12 50
C. Kayser	360	25	2 50

And in accordance with law, and an order from the Board of Directors, made on the 9th day of May, 1899, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the company's office, 217 Twelfth St., San Francisco, California, on MONDAY, the 10th day of July, 1899, at the hour of 5 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

F. METTMANN, Secretary.

Office—237 Twelfth St., San Francisco, California.

DELINQUENT SALE NOTICE.

ARRASTRAVILLE MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 16th day of May, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
A. E. Sayre	627	4,400	$440 00

And in accordance with law, and an order from the Board of Directors, made on the 16th day of May, 1899, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, 218 Jackson St., San Francisco, California, on TUESDAY, the 11th day of July, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. MIDDLETON, Secretary.

Office—218 Jackson St., San Francisco, California.

GLOBE ARIZONA, April 22d, 1899. 189

Weber Gas and Gasoline Engine Co.,
405-415 Southwest Boulevard,
Kansas City, Mo.

RECEIVED
APR 27 1899
Ans'd 4/27
WEBER G. & G.E. CO.

Gentlemen:-

In reply to your letter of April 8th, would state that the

Weber Gas Engine Co., 430 S. W. Boulevard, Kansas City, Mo.

10 H.P. Hoist is now in place and in operation on a shaft 200 feet deep, and working very smoothly and satisfactorily.

Yours truly, Edw. H. Cook

THE

"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

Send for pamphlet to THE PNEUMATIC CYANIDE PROCESS CO.,
306 BOSTON BUILDING, DENVER, COLO.

W. PELLEW HARVEY, F. C. S.

The Vancouver Assay Office and Ore Testing Works.

MINING ENGINEER, METALLURGIST AND ASSAYER.

Working Tests by Amalgamation and Cyanidation. Ores Purchased. Assays and Analyses.

Representative for:

Vivian & Sons, Swansea; The Elliott's Metal Co., Wales; The MacArthur-Forrest Process (Cyanide).

OFFICES: VANCOUVER AND VICTORIA, B. C.

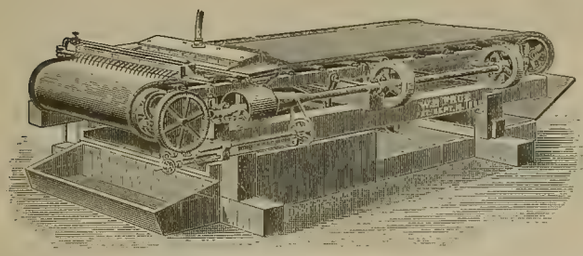
Denver Ore-Testing Works,

CHEMISTS ASSAYERS ENGINEERS.

521-525 Seventeenth St., DENVER, COLO.

WORKING TESTS by Amalgamation, Concentration, Chlorination and Cyanide.



ORES CRUSHED AND SAMPLED. MILL RUNS.

Prices on Application.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

FOR DESCRIPTIVE PAMPHLETS, ADDRESS

J. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.,

132 MARKET STREET, (Successor to Adams & Carter.) SAN FRANCISCO, CAL.

RISDON IRON WORKS,

Cable: "Risdon's." Code: A. B. C. & Leiber's.

RISDON IRON WORKS SAN FRANCISCO, CALIFORNIA.

MANUFACTURERS OF

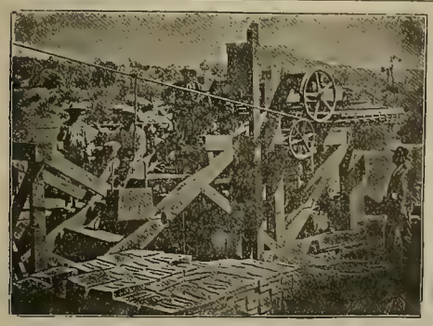
Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.



Send for Dredging Catalogues Nos. 15 and 16.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

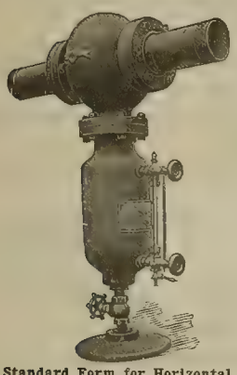
THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

THE CALHOUN EXCAVATOR.

A COMBINED POWER-SHOVEL AND CABLEWAY.
.....Ask for Circular.....



Cableways, Double Rope Tramways, Wire Rope Transmissions, Incline Planes, Logging Machinery, Suspension Bridges,

DESIGNED, FURNISHED, ERECTED. Write for Estimates.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

Thousands of Dollars Will Be Saved,

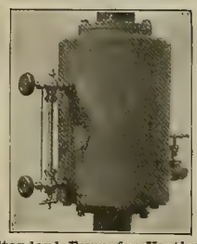
and therefore made, if you will accept our recommendation and install one of the .. **Cochrane Heaters.**

Standard Form for Horizontal Pipes.

THE

COCHRANE SEPARATORS,

Appliances for removing liquids or solids from steam or other vaporous or gaseous currents.



Specifically . . .

FOR PURIFYING EXHAUST STEAM FROM CYLINDER OIL.
(Non-Condensing and Condensing Systems.)

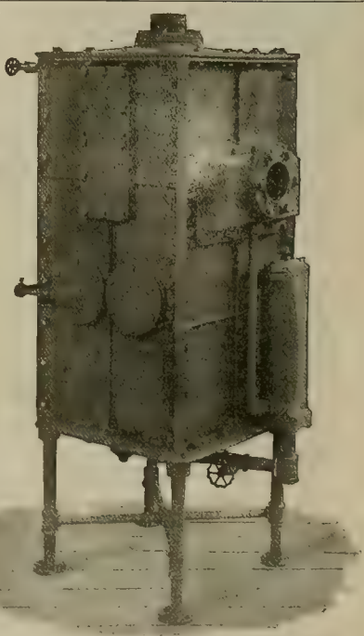
FOR TAKING WATER OUT OF LIVE STEAM.
(Standard and Receiver Forms.)

FOR REMOVING OIL, GRIT, ETC., FROM AMMONIA CURRENTS, COMPRESSED AIR, ETC

HORIZONTAL, VERTICAL, ANGLE AND SPECIAL FORMS.

Standard Form for Vertical Pipes.

—SOLE PACIFIC COAST AGENTS,—



PARKE & LACY COMPANY,

21 & 23 Fremont Street, San Francisco, Cal.

The Economy of Utilizing a Waste Product--Exhaust Steam

A Combination of Feed Water Heater, Purifier and Separator.

WHY FEED WATER HEATERS ARE USED.

For every 10° added to the temperature of the feed water by exhaust steam nearly 1% of fuel is saved. Therefore, every steam plant equipped with a feed water heater which delivers the feed water at a temperature of from 208° to 212°, the average temperature of the water supply being 60° F., is saving its owner **over 13%** of the fuel which would be required were no heater used.

The Dredger and Its Field.

The application of dredging machines to the recovery of gold has had a history like every other branch of the mining industry. At first it was wholly an experiment. Many changes had to be made in the mechanism of the dredgers themselves and also in the methods of operating them. The past five years has seen the most rapid strides made in building and manipulation of machines of this class, and now they are pronounced a success, though without doubt further experience with them will suggest improvements. Like every other mechanical device the construction of any one machine may be found unsuited to all conditions which may be met. The ideal field for the dredger is undoubtedly that in which the gravel is uniformly small—that is, containing no large, unwieldy boulders—and where the bedrock is soft enough to be taken up to a depth of several inches by the scoops. This condition cannot always be obtained, but ground where boulders are large and bedrock uneven and hard is being successfully dredged, looking at it from the mechanical standpoint, and, as it pays, may be considered a complete success. The illustrations on this page are those of successful dredging operations in Butte Co., Cal., and will be found more fully described on page 36.

DREDGER WORKING INTERIOR GROUND, STACKING TAILINGS 26 FEET HIGH, BUTTE CO., CAL. (See page 36.)

The success of dredging operations has opened a new and broad field for work in gold regions all over the world, from New Zealand to Siberia. The conditions obtaining in California deep gravel deposits suited to dredging are usually of a class favorable to such operations.

The large volume of deposits of this character are found occupying a position at what was at one time the lower portion of the gold-bearing streams at and near where they emptied into the great lake which then occupied the interior valley of California. The gravels lie in broad sheets, often intercalated with rhyolite tuff which was contemporaneously deposited. Some of this latter is hard and firm and affords a good bedrock for the dredger, being smooth on its upper surface, but underneath may be found a second layer of gold-bearing gravel which in some instances it may be found profitable to blast away.

GOLD DREDGING ON INTERIOR GROUND, BANK 16 FEET ABOVE WATER, BUTTE CO., CAL. (See page 36.)

THERE are in California thirty-seven counties which may be considered as mineral-producing, as the larger part of their output, with two or three exceptions, is of mineral character. These minerals include gold, silver, copper, coal, lime, asphaltum, cement, petroleum, asbestos, manganese ore, chromic iron, magnesite, quicksilver, borax, building stone, etc., besides which several counties are large producers of mineral waters of world-wide fame. There are many counties producing excellent marble, building stone, paving blocks and other mineral products of lesser value. A great number of natural resources of the State are almost wholly undeveloped. The most prominent are metal mining and the production of asphaltum and petroleum.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Dredger Working Interior Ground, Stacking Tailings 26 Feet High, Butte Co., Cal.; Gold Dredging on Interior Ground, Bank 16 Feet Above Water, Butte Co., Cal., 33. "Kia Ora" Dredging Gold in an Orchard; The Marigold Dredge and Some of its Tailings, 36. Latest Mining and Metallurgical Patents, 38.

EDITORIAL.—The Dredger and Its Field, 33. Rate and Amount of Wages; Enthusiasm in Mine Promotion; Business of the Patent Office Continues; Miscellaneous, 34.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 41-42-43.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 54.

MISCELLANEOUS.—Concentrates, 35. Gold Dredging in California; Scarcity of Water on the Rand, 36. Diamond and Gold Mining in Minas Geraes, Brazil; Some Experiences of a Working Miner, 37. Latest Mining and Metallurgical Patents, 38. Scale of Wages in Colorado; Unlawful to Use Metal Pumping Bar; Industrial Notes; Personal; Obituary; Recent California Dividends, 39. Notes on the Alleged Shortage in Cyanide Bullion; Something About Explosives; The Source of Gold; Water Power Electric Plants in the United States, 40. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 41. Commercial Paragraphs; Recent Mining Incorporations, 54.

It is claimed that the recent advance in wages and the price of materials has increased the cost of producing copper at the larger Lake Superior mines 1 cent per pound, and at the smaller mines somewhat more.

Recent advances in the prices of iron and steel led to the belief that a reduction in the exports of these products would follow, but they continue to form the most important item of exports of manufactures.

The character of prospecting done the past winter and spring in the Buffalo Hump region is evidenced by the statement that location notices posted in February last when the snow was deep are now 15 to 30 feet above the ground.

Although much fault is found with those who work out the richest portions of a mineral deposit, leaving the low grade material for those who come later, there are few who would not do likewise if placed in similar position.

So rapid have been the recent strides in metallurgy that even those who have been engaged in the business in one place for a quarter of a century or more begin to wonder if they really have yet learned it all. In view of recent discoveries and improvement, it is evident there is still much to learn.

So voluminous have become the Transactions of the American Institute of Mining Engineers that it has been considered advisable by the council to issue certain of the papers submitted in the form of bulletins. These will be issued separately and will not be found in the annual volume of Transactions. Bulletin No. 1, entitled "The Progress of Metallurgy in 1898," has just been issued, and constitutes a catalogue of contributions to that science during the year 1898.

In a hope of finding a solution of the problem how to supply the needed quantity of water to the mines of the Witwatersrand, the South African *Mining Journal* reports that the larger mining concerns on the Rand have united for the purpose of putting in a pumping plant, pipe line reservoirs, etc. It is stated that the engines will be required to lift 9,000,000 gallons of water daily to a height of 900 feet. This undertaking, if carried out, will dwarf all similar undertakings elsewhere. Doubtless pumps can be made which will be able to accomplish this, though the lifting of such a large volume of water (6250 gallons per minute) to so great a height must be looked upon as an experiment. Doubtless the mechanical difficulties can be overcome if they can find this large supply of water.

Rate and Amount of Wages.

Seldom has there been more glaring an instance of unwise interference than in the recent legislation regarding the mining industry of Colorado and British Columbia. Till recently matters in that State and Province were mutually harmonious. Labor and capital were getting on profitably and pleasantly together; there was promise of a prosperous year. Deep snow, winter losses, enforced cessation of work and all the irksomeness of isolation were being forgotten and all looked forward to a busy season.

Upsetting all this came the act of some well-meaning but mistaken legislators, who had decreed that the whole was not equal to the sum of its parts. The present result is industrial chaos, great loss, inevitable setback, to be followed by gradual adjustment, getting together again and a patching up of the break, till some bull in the legislative china shop, who soils all he omits to shiver, breaks loose with some labor bill next year or the year after.

So much has appeared concerning the relations of labor and capital that anything said here new would not be good, and anything good would not be new; but it is believed that a few trite but possibly forgotten facts regarding wages in general, their rate, amount, etc., are in order.

Underlying all these surface indications lies the law of wages, the relation between their rate and amount. Whether in Colorado or China, British Columbia or Buenos Ayres, this basic principle is at the bottom of all unrest and protest—the efficiency of labor and what it produces, whether it be in mining, manufacturing, or any other industry where men work for so much or so little per day. Whenever the popular fallacy that "the rate of wages depends on supply and demand" is discarded for the right understanding of the relation between the rate and amount of wages, the question will be in a fair way to a solution mutually satisfactory. Legislators in Colorado, British Columbia and elsewhere dimly see and faintly realize this, and at best they can try to approach a fair solution of the problem; but such efforts usually produce strife, turmoil and dissatisfaction.

By "amount of wages" is meant the aggregate cost of labor in the production of anything; the rate is the daily, weekly or monthly individual stipend.

There are three things in every cost account—material, labor, and attendant expense. Whenever any one of the three increases, the other two must diminish, or the price of the product must increase, or else the production must cease and the industry die. When any one of the three decreases, either or both of the other two can increase, or the product be decreased in price.

This may be combated, but a little reflection will show that it is axiomatic. Whatever the product, it has confessedly an international value—that is, there can continue no great difference in price of anything anywhere, the tendency of modern markets being to immediately equalize values, the inevitable corollary being that dearer material or excessive expense entails low wages, and cheap material or small expense admits of high wages, the cost of labor being about the same everywhere, regardless of the rate, the rate of wages being determined by what the wages produce; for "the rate of wages" is what wages earn, the amount of wages determining the difference between skilled and unskilled labor. Whenever the assumption that "demand and supply" set the price of labor is sufficiently understood to be discarded; whenever the distinction between the rate and amount of wages can be clearly and popularly seen, there will be a long step taken toward permanent and mutually profitable agreement between "labor and capital." When that time does come there will be no such attempts at regulation as the recent well-meant but abortive efforts in the British Columbia and Colorado Legislatures.

"But how about Utah?" may be asked. The apparent acquiescence in the laws there makes no difference in the ultimate adjustment of the question in Utah or elsewhere. The point is that no legislative enactment, anywhere, ever did or ever will settle a question that is not susceptible of such effort at settlement. The number of hours there shall be in a day's work; the price that shall be paid for that labor per hour or per day, are two things that cannot be defined nor decided by any State or Federal law; those things are always set and settled outside of courts and law-making rooms. The natural law of the business world is the only tribunal that has jurisdiction in the case.

So far as Colorado is concerned, it is locally claimed that the legislative enactment that went into effect June 15th but precipitated the trouble, and that had there been no eight-hour law there would have been a strike by the smelter employes for shorter hours.

Enthusiasm in Mine Promotion.

It is not always easy to understand why so many men whose characters are above reproach, whose reputation for honesty and truthfulness are never questioned, who have the fullest confidence of their fellow-men, when they engage in mining transactions, cast aside all regard for fact and make the most extravagant statements concerning the property that they are trying to promote. It has become almost axiomatic that many men, truthful and upright in all other walks of life, will lie when talking mines, and evidently it is expected. So commonplace has this practice become that it would seem that one must greatly exaggerate his statements in order to have a small portion of the truth believed. In part, this habit or custom is no doubt due to lack of knowledge of mining affairs. When describing a vein it is so easy to give its greatest width as its average width, and the greatest value as the average value, that it is done almost inadvertently, and is not looked upon in the light of misrepresentation of facts, and is not done with a purpose to deceive, for there are facts to substantiate a portion of the statements at least. Then, too, mining is such an enticing business. Who may say that a vein 4 feet wide at the surface or near it may not widen to 40 feet in depth, and who shall dare to assert that when $100-rock has been found in the small vein, that the whole 40 feet will not be $100-ore in depth, and the promoter gives the mine the benefit of the doubt, worked up by his own enthusiasm, and states it first as a probability. After repeating the statement a few times to various people and revolving the great possibilities of the mine in his mind, the probability becomes fact and is stated as such without hesitancy, and he becomes indignant at even a suggestion that he is dealing in fancies. It must be enthusiasm that causes upright business men to misstate facts concerning the development of value in a mine; and as this peculiar human weakness is recognized, every one seems willing to overlook the unguarded statements and to make due allowance for enthusiasm, and if, after such deduction is made, there still remains a fair sort of business proposition, some mining engineer who is unenthusiastic is usually employed to ascertain the truth.

About five years ago an employe of the U. S. Patent Office at Washington, D. C., a member of the Board of Examiners, is reported to have resigned because of his expressed conviction that everything that could be patented had been brought out; that there must necessarily be a dearth of work for him, and, hence, he had best embrace a proffered opportunity to get another position. But as the years go on the business of the patent office continues increasing, and there never was so much incentive for inventive brains as at present. Pres. Glidden, of the Erie Telephone System, Cleveland, O., was authentically reported this week to have asserted that he would "pay $1,000,000 for a telephone repeater or quadruplex that could be used in connection with the telephone and would produce, telephonically speaking, the same results that the telegraph repeater and quadruplex do to-day in the workings of the telegraph." Time was when the inventor was laughed at, and, after making suitable excuses for his existence and apologizing for his presumption in remaining above ground, he had to demonstrate the absolute fitness of his device before he could get foothold or recognition. Now, he is encouraged by munificent offers to exercise his inventive faculties, and, in case of success, is sure of financial reward. It is a long cry from the era when inventors were shunned and maltreated to that now opening.

If the present large weekly output of iron ore now being made by the Lake Superior iron mines can be maintained throughout the season, it is thought the 16,000,000 tons wanted will be shipped.

Concentrates.

A SQUARE INCH equals 1.2732 circular inches.

A CIRCULAR INCH is one whose diameter is 1 inch and whose area is .7854 square inch.

ALL mine cars should be provided with false bottoms which may be replaced when worn.

THE highest price recorded for quicksilver since 1850 was £26 per flask, in London in 1874.

IT is reported that the Carnegie Steel Works at Pittsburg, Pa., are making $100,000 daily.

A HEAT UNIT is the amount of heat required to raise one pound of water 1° F. (from 39° to 40°).

STEAM WAGONS are to be employed in hauling borax from Rose Valley, Or., to Winnemucca, Nev.

A 1-FOOT POUND is the expression used to indicate a pressure of one pound exerted through a space of 1 foot.

THE use of crude petroleum on the roads of Santa Barbara Co., Cal., in place of water, has proved a success.

EQUAL parts of shellac and calophony dissolved in six parts strong spirits of wine make a recommended cement for tin.

THE De Beers diamond mine in South Africa is at present the largest dividend payer in the world. It paid in '98 $7,687,300.

THE cost of treating tailings by the cyanide process at the Standard Con. works at Bodie, Cal., is stated to be $1.20 per ton.

WHILE casually walking along a ground sluice of a mine in Sierra county, Cal., recently, a visitor picked up a nugget of gold weighing a pound.

ALL lengthy tunnels should have air shafts connecting with the surface, which will also afford a means of escape for men in case of accident.

SATIN SPAR is a variety of gypsum, calcium sulphate. It usually occurs in vein-like sheets, the fibers being perpendicular to the sides of the deposit.

WHERE buckets are dumped in proximity to shafts the shafts should be provided with a door to prevent the falling of rock or other objects into the shaft.

THE Colorado river is overflowing its banks near the mouth of New river, and a large volume of water is said to be flowing toward Salton basin as in 1892.

WHEN possible a sufficient space should be cut around a shaft for the passage of workmen on each level, that they may not be obliged to step across a compartment of the shaft.

THE best way to guard against being flooded in a mine is by supplying abundant pumping or bailing capacity. Bailing is ineffectual where large quantities of water are met with in sinking.

CALAVERITE is a telluride of gold and silver, containing tellurium 56%, gold 40.92% and silver 3.08%. It was first found in the Stanislaus mine on Carson hill, in Calaveras county, Cal., and was named by F. A. Genth.

A GEYSER in the Yellowstone National Park, Wyoming, which was supposed to be extinct has shown sudden activity and is reported to be spouting a column of water, mud and steam to a height of 250 to 300 feet.

"HYPO" as applied to metallurgy refers to the hypo-sulphite of soda and is used in dissolving the chloride of silver from its ores in mills. The silver is recovered by precipitating it from the solution by adding either calcium or sodium sulphide.

THE melting point of sulphur is 448° Centigrade; of gold, 1045°; of palladium, 1500°; of platinum, 1775°; of gray foundry iron (carbon 3.50, silicon 1.75, phosphorus 0.50), 1220°; of soft steel (carbon 0.10), 1475°; of hard steel (carbon 0.40), 1455°.

"HEMATITE OF IRON" is not a good expression. Hematite is the name given to a red iron oxide ore, and limonite to the brown oxide of iron. Hematite is sesquioxide of iron and is also known as micaceous iron, specular iron, etc. Limonite is a hydrous sesquioxide of iron and is essentially the same as hematite, but containing about 14% water.

IN large stopes which have not been filled when the overhanging ground shows signs of settling it is almost useless to attempt to hold it by introducing timber. If the stope can be quickly filled with waste run in from above, that is the proper thing to do. This condition of affairs may be avoided by filling as the ore is extracted, leaving no large excavation unsupported.

WHERE two veins converge in depth, the vein upon which the prior location was made shall have all of the vein below the point of convergence. This is the law, but if each vein preserves its identity by reason of some physical characteristic, and only separated by a clay seam, it would be a matter for the courts to determine whether or not such distinction shall be made.

EARTHQUAKES are of much more frequent occurrence than is generally supposed. The surface of the earth is almost constantly quivering from dynamic causes, as is shown by the seismograph. It is only the more pronounced shocks that are noticeable without the aid of some instrument such as that referred to. Danger from earthquakes is much greater if the vibration be prolonged than a short but more violent disturbance.

WHEREVER a shaft is sunk on a vein or in an ore body a sufficient pillar of ore should be left about the shaft to render it secure. The amount which should be left must be determined by the character of the ground, and stoping should not be permitted within the limit determined to be the proper one, until the mine or shaft is to be abandoned. In a large vein it is inadvisable to remove any portion of the vein lying between the shaft and walls.

THE first recorded labor "strike" was 2211 years ago—312 B. C.—when flute players under Numa Pompilius of Rome refused to play at a banquet unless paid what they thought their services were worth. Later on, Nero posed as a friend of labor and stirred up considerable strife. Trajan, 52 A. D., opposed the labor unions and had a stormy reign. There is nothing modern about strikes any more than about trusts. Most of what is said regarding both was said 2000 years ago. In all ages has existed a natural desire to get all possible for sale of any article, whether labor, skill or manufactured product.

GOLD is reported to have been found in the Cargo Muchacho mountains in San Diego Co., Cal., as early as 1575. The gold was obtained from dry gravel, or rather detritus, for none of it was washed gravel, by vanning in the wind. At a place called Pipendero it is asserted that in more recent years $15,000 was picked up on the surface of the ground. This place was about two miles from the Cargo Muchacho mine, in an easterly direction.

IT is understood that W. S. Stratton was the original discoverer of the Independence, Colo., mine, though it was not the first discovery in the Cripple Creek district. Prior to his Cripple Creek discovery, Mr. Stratton was a carpenter, prospector and miner. He was never a doctor so far as known. It is claimed that the Independence was sold at $11,000,000, Mr. Stratton receiving part cash and the balance in stock in the corporation taking over the property. No positive statement can be here made as to the value or amount of ore blocked out in reserve in the mine.

PICACHO BUTTE, thirty miles above Fort Yuma, in San Diego county, Cal., is a remnant of a large field of andesite which at one time covered the country in that neighborhood for miles to a depth of several hundred feet. The beds dip at about 15° and are composed of andesite in various conditions—in part tuff. The erosion has been enormous, for this huge remnant of a great flow of lava is isolated from all others, though considerable masses may be seen on the surrounding lower levels. The underlying formation, which is schistose, with many dykes, large and small, is gold-bearing.

CHROMITE is the ore from which all the salts of chromium are obtained. The ore occurs in several counties of California, and as far as known always in serpentine. It is found in irregular deposits and not in defined veins. It is used chiefly in the manufacture of chromate and bi-chromate of potash, employed in dyeing and in the manufacture of pigments. Much of the chrome ore in California is mixed to such an extent with inclusions of serpentine as to be too low grade for shipment. Often ore of this kind disintegrates on exposure, when it may be cleaned by simply sluicing and concentrating on riffles, employing only sufficient water and fall to carry away the lighter material.

WHEN figuring upon the installation of an electric transmission plant it is necessary to allow a sufficient factor for losses. An authority gives these as follows: Loss due to friction of steam engine, 10%; loss in belting between engine and generator, 3%. If direct-connected this is not figured. Loss in generator, 10%; loss in line, 10% to 20%, depending on its length, size of conductor, care in building line, etc.; loss in motors, 12% to 20%, depending on kind used and service required of them; 5% to 10% loss between the brake horse power and the machine to be driven, to which may be added the loss in the machine itself due to friction. Total efficiency, 50%, taking the lowest estimate of loss. Where the distance is short and great care is taken in making the installation the actual efficiency may be increased to 60%.

THE KNOX system of blasting is used in quarrying, and consists in drilling two holes in the rock, these holes being located along the line where a fracture is desired, and about 1 foot apart. Black powder is charged in the hole, the quantity being determined by the size of the rock mass it is desired to split off. Tamping is put in the hole, but is not placed in contact with the powder, a space of 1 to 3 feet being left between tamping and powder. This affords an air cushion, which in part receives the shock of the blast. The holes are fired and recharged several times, the result being the fracture of the rock along a line corresponding to the direction of the holes. In a thoroughly homogeneous rock this system works well, and much larger masses can be detached than by feather and plug work, and much more inexpensively.

SPODUMENE, which occurs at the Etta mine in Custer county, South Dakota, is being mined and shipped to New York. Spodumene is an aluminous silicate containing 8.4% lithia, for which mineral it is chiefly valuable. It occurs in crystals of immense size, one more than 50 feet in length and 5 feet or more in diameter having been cut in the workings. There are scores of smaller crystals in the Etta mine, having a diameter of 1 foot or more and a length of 12 to 20 feet. When originally discovered the Etta mine was worked for mica, later for tin, and now for lithia. The entire hill upon which the work has been done is an aggregate of coarse crystals of various minerals. Beside those above mentioned are white and vitreous quartz, albite feldspar, rose quartz, black tourmaline, apatite, columbite, titanite, wolframite and other more rare minerals, including emerald nickel and, it is stated, also stannite.

ALTHOUGH hydraulic mining flourished for many years in California when the business was carried on without interference or restraint, the statistics of operations during that time do not indicate any consistency in the quantity of water employed in these numerous operations as related to the amount of gravel moved per inch of water. The quantity of gravel moved, as stated by A. J. Bowie, varied all the way from 1 to 24 yards per inch. The principal factors in determining the amount of gravel moved with a given volume of water are the pressure or head employed and the character of the gravel. A light, loose gravel will wash down much more rapidly than a tight gravel containing much clay, with the same quantity of water under a given head. Another very important consideration in the duty of the miner's inch is the grade of the sluices. A heavy grade will carry away material much more rapidly than a light grade. Often there is a great difference in the amount of gravel moved in one mine under similar conditions owing to the difference in the gravel.

THERE is a current theory that dynamite, or any nitro powder, "exerts its explosive force downward, and not upward, as is the case with black powder." This is an error. Dynamite, and all compounds of nitro-glycerine, as well as black powder, exerts its explosive force equally in all directions, and will produce the greatest apparent results where there is the least resistance. When confined in a hole drilled in a rock, it fractures the rock along the lines of least resistance, and its downward force is often evidenced by the pulverized condition of the rock surrounding the bottom of the hole. If the explosive force was exerted wholly downward, that portion of the rock surrounding the upper portion of the drill hole would not be shattered and torn away. Black powder, being much less powerful than nitro powder, shows little of its explosive effect downward, simply because it lacks the necessary force. When an explosion occurs at a magazine or a powder works, a large hole in the ground generally marks the site of the disaster, and this is pointed to as indicating that the explosive force of nitro powder is downward. The fact is, as previously stated, the force is equal in all directions, but the upward force is expended upon the frail building and upon the air, and its effect in that direction cannot be measured.

THE principal source of borax in California at present is the deposits of calcium borate found in vein-like masses in the Calico district and in the beds of dry lakes in Inyo county. The colemanite vein in the Calico hills is really a dry-lake deposit, precipitated in Tertiary time, subsequently overlain by several hundred feet of later formation and then tilted and folded by dynamic forces to its present position and then exposed by erosion. The beds containing calcium borate in the mud shales near the village of Calico and in the borax fields northwest of Daggett are the result of the crystallization of calcium borate from solution saturating mud deposits which were nearly contemporaneous with the formation of the colemanite deposit. Borax has a slightly sweet taste and gives an alkaline reaction. It is soluble in twelve times its weight of cold or two times its weight of hot water. It melts at low temperature in its water of crystallization. If the heat be raised it fuses to a transparent liquid which, on cooling, becomes a vitreous mass known as borax glass.

VOLTS, in electricity, indicate the electric pressure or electro-motive force, and when compared to water power is similar to head or difference in level in feet between source of supply and discharge. Ohms indicate electric resistance, which varies with the material employed as a conductor and is directly proportional to the length of the conductor and inversely proportioned to its cross section: as compared to water, is similar to resistance of pipes, which increases with the length of the pipe and its degree of smoothness, and decreases with increase of sectional area. Amperes designate the strength of current or rate of flow. One ampere per second equals one coulomb: compared with water, is the rate of flow, as cubic feet or gallons per minute: equivalent to the "miner's inch." A coulomb is the unit of quantity and equals the rate of flow multiplied by time. In water quantity is measured by cubic feet or gallons per minute. A watt is the unit of electric power and is equal to one volt ampere; 746 watts are equal to one horse power. In water a horse power is the number of foot pounds of work done in one minute divided by 33,000.

ANSWERING several queries on the subject of the right of aliens to purchase or locate mineral lands of the United States: The United States statutes plainly state (Sec. 2319): "All valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase, (from the United States), by citizens of the United States and those who have declared their intention to become such, under the regulations prescribed by law, and according to the local customs and rules of miners in the several mining districts, so far as the same are applicable and not inconsistent with the laws of the United States." Any State law giving aliens the right to locate, take or hold or purchase from the United States the lands of the public domain is in conflict with the United States statutes. A citizen cannot locate land for an alien corporation. The *Landowner* says concerning this: "A mineral entry made by an alien is not void, but voidable, and, while of record, the land covered thereby is segregated from the public domain. This simply means that a location made by an alien may be successfully contested by a citizen of the United States."

WHEN a State has selected certain lands in lieu of the school sections, 16 and 36, and the United States has issued a patent therefor, such patent will stand unless it can be shown conclusively that the mineral character of the land was inadvertently overlooked or that the patent was obtained by misrepresentation. Having acquired the land, the State may sell, lease or dispose of it in any manner it may choose while complying with the law, which differs somewhat in the several States. The United States does not issue a patent to the State for sections 16 and 36. When the survey has been made and has been approved, the sections in question simply gravitate to the State, unless their mineral character be established, when the State may make selections of lieu lands. In the case of lieu lands, however, it is different, and an examination into the character of the land is made, or presumed to be made, and if no mineral veins or deposits are known to exist thereon the United States issues a patent for the land. Any subsequent discovery of mineral will not affect the title of the State to the land, and if a mineral vein or deposit were known to exist on the land prior to the issuance of the patent, and no adverse claim made, it would be very difficult to have the Government set aside such patent.

NITRO POWDER and black powder may often be employed to advantage in the same hole, where large masses of rock are to be dislodged by a single series of blasts. Holes are drilled at stated distance apart, usually 10 to 16 feet, and set back from the face a similar distance, according to the character of the ground. These holes are generally started by striking the drill with a hammer, but are finished by "churning." They are made 12 to 20 feet deep, again depending on the character of the ground. When finished they are chambered—that is, a small quantity, one to three sticks, of No. 1 powder is exploded in the bottom of each for the purpose of shattering the rock about the bottom of the hole to make space for a heavier charge of powder at the bottom. Then a quantity of nitro power and sometimes a keg or more of black powder is poured into each hole, and the set of holes is discharged by the electric spark or by fuses cut to discharge as closely together as possible, though the latter loses the benefit of contemporaneous discharge of the several holes if but a second or two elapses between the explosions. The nitro powder, being a detonative compound, explodes immediately, shattering the surrounding rocks; the black powder, being a combustive compound, exerts its force more slowly and lifts the fractured rock mass, throwing it out of its position and rendering it accessible to the miner. This class of blasting is particularly suited to open-cut work, where it is not desirable to scatter the rock by the force of the blast.

Gold Dredging in California.

Like all other forms of gold mining, dredging is evolutionary and progressive. Costly New Zealand experience has evolved the present gold dredging machine, which, though not perfect, is well adapted to the purpose, and is proving itself of economic value. Results determine worth, and the net profits now being monthly produced from ground hitherto unprofitable with the rude and crude methods of earlier days, practically demonstrate how profitable this method of mining may be made. One great advantage is the readiness of operation; there are no expensive preliminaries, no opening up, sinking, drifting, timbering or developing; no building of mills or transfer of heavy machinery; when the dredge is ready the mine is open, and the dredge itself is mill, concentrator and amalgamator. Operations in California, Colorado, Idaho, Montana and Oregon confirm this.

A recent visit to the old historic Feather river, near Oroville, Cal., showed what is now being done in this new era of California mining. Where even Chinese could no longer "make wages," dredging machines are in operation, paying considerably more than expenses from the hour of starting, with the prospect of still greater profits as richer ground is reached.

The work of building and operating those dredges has largely been under the superintendency of R. H. Postlethwaite of San Francisco, who has furnished some data in connection with this interesting subject. Mr. Postlethwaite says:

The dredge built some eighteen months ago by the Risdon Iron Works of San Francisco, Cal., for the Feather River Exploration Co., has been operated continuously ever since its erection, digging about 24 feet below water level with a 16-foot bank ahead of it. Two months ago the two dredges, owned respectively by the Marigold Dredging Co. and the Kia Ora Gold Dredging Co., were started. Following is a short description of their construction and mode of operation: The pontoon is 70 feet long by 29 feet wide and 5 feet 6 inches deep with undercut stern and rounded bows, the latter being of great advantage when cutting into high ground which will not readily break down. The ladder, which is of our usual heavy girder type, projects 16 feet beyond the bow and thus enables the dredge to cut its own flotation through any ground. This ladder carries a string of heavy buckets, each of a capacity of 3¼ cubic feet, which dump onto delivery plate at the rate of thirteen buckets per minute. The material, consisting of boulders, cobbles, sand and gold, pass by gravity from the delivery plate into a perforated revolving screen, set on a slight incline. A perforated water pipe conveys water under pressure which thoroughly disintegrates and washes the material as it slowly passes down the screen, the circular motion of which tends to make the stones climb the sides and then fall back, thus causing the rubbing off and breaking up of any clay or sticky material which may be on them. The water, fine gravel, sand and gold drop through the perforations in the screen into a distributing box, from which it passes on to the different sections of gold-saving tables by means of doors in the distributing box. Any of these sections of tables can be shut off, thus enabling them to be cleaned up without stopping the dredge. The gold-saving tables are made of cast iron, so that they do not warp and leak with every change of weather. They are covered with cocoa matting and expanded metal, and experience shows that nearly all the gold is caught in the first 6 inches of table.

After leaving the tables the material passes into a flume fitted with angle-iron riffles, down which it is carried and deposited overboard astern of the dredge. By way of showing what excellent gold savers the above-described tables make, I may state that I lately cleaned up the flumes and only got $16 of gold out of them, although during the same period over $2500 had been cleaned up on the tables. While I do not claim to be able to save 100% of the values, I do claim to save such a large percentage that careful and persistent panning of the tailings will hardly ever obtain a color. The coarse material which will not go through the screen perforations is conveyed by gravity onto a stone elevator and deposited 24 feet above water level. This elevation above the natural bank level is found necessary, owing to the fact that the ground swells very much after being broken out of place, and therefore requires more space when redeposited.

The digging, stacking and pumping is now operated by a vertical compound surface condensing marine engine, indicating about 45 H. P., the fuel consumption being two and one-half cords of good wood per day of twenty-four hours. The winch, by means of which one man operates the entire boat, is driven by a pair of donkey engines and the electric light is supplied by a very neat and compact direct connected high speed engine. The electric light engine and winch engine are both connected to the condenser which, besides conducing to fuel economy, makes the necessary supplementary feed very small, which is of great importance to a dredge working in inland ground where the water gets muddy. The surface condenser is arranged in the suction of the main centrifugal pump, so that the expense of running a circulating pump is done away with.

Both the Marigold and the Kia Ora Gold Dredging Companies have signed contracts with the Yuba Water Co. for a supply of electric energy which will be installed next October and will simplify the machinery of the dredges considerably.

Though opposed by many authorities on this subject, I have long contended that it is possible to excavate a hole in the gravel down to water level and to pump the same full from an independent supply and to start a dredge therein. Some authorities were of opinion that the seepage could not be overcome; others claimed that no dredge could be designed which could take care of its own tailings, and that it would consequently get tied up and rendered useless. The matter has now been set at rest, and my contention proved correct by actual experiment, for the Kia Ora dredge which I am managing myself commenced operations in the middle of an orchard in a hole 11 feet deep. This excavation was filled and is kept filled by a supply of 250,000 gallons of water per twenty-four hours, conducted from the Feather river by means of a flume 3000 feet long. The size of the excavation was such that when the dredge started it could not turn round and was entirely enclosed by high banks. Now, however, after six weeks' run, the hole has been enlarged to such an extent that the face of gravel is 250 feet wide, or nearly three times more than it was at the start. The above conclusively proves, I think, that seepage can be overcome and that a dredge can be designed to take care of its own tailings under the conditions above considered.

By careful measurement the dredge for the first month of twenty-seven working days lifted 29,000 cubic yards, bank measurement, which means about 40,000 cubic yards bucket or tailings measurement; this is a good showing for the first month's work with a new crew. This experiment, which has proved successful, will open up a very large area of ground in California and neighboring States which previously could not by any process be worked at a profit. The actual expenses in connection with the Kia Ora's month's run were only 3¼ cents per cubic yard, bank measurement. In order to allow a large margin for future wear and tear a safe estimate would be 5 cents per cubic yard, bank measurement. This cost, as soon as electric power is installed, will be considerably reduced, as the river pump alone can be run at a saving of at least $100 per month over present, and the enlargement of the scope and possibilities of dredge work is sufficiently suggestive to need no further elaboration.

The MINING AND SCIENTIFIC PRESS has had considerable to say on this subject before, and gives place to its consideration now to give prominence to the point made by Mr. Postlethwaite, viz., that actual profitable work, tangible results, prove the feasibility of starting in wherever suitable material exists, provided that room enough can be made in the gold-bearing gravel down to water level, and water sufficient for floating and operating the dredge can be flumed or piped in. This has been done in Butte county, Cal.

"KIA ORO" DREDGING GOLD IN AN ORCHARD.

Scarcity of Water on the Rand.

At present the mines of the Witwatersrand do not supply one-fourth the amount of water required to operate the mills and cyanide works. The balance of water is obtained from the natural rainfall—a limited and always uncertain quantity. This condition of affairs precludes the material extension of the crushing capacity of the mills. Steps are being taken to secure a permanent supply of water by bringing it from a distance. Concerning this situation, the Johannesburg *Mining Journal* says:

THE MARIGOLD DREDGE AND SOME OF ITS TAILINGS.

The opinion of Rand mining authority is agreed upon one important point. A serious mistake has been hitherto made in placing so much reliance upon the rainfall in a matter which affects the vital conditions of the industry. As the shortcomings of the natural source of supply have gradually made themselves clear, it was natural that the charge should be laid against those who are responsible for the direction of the mining industry that they have failed to arrange for a general, adequate and permanent water supply for the mines. Mr. Eckstein has made an honorable and gallant admission of the mistake in his statement that the Rand directorates have all been taken by surprise by the extraordinary failure of the supplies from rainfall.

How serious the mistake has been will be apparent if the rainfall records are considered. During the

ten years, 1888–1898, inclusive, the average rainfall has been 30.16 inches, and the average number of days has been 90.6 on which rain has fallen in each year. The lowest measurement was recorded in 1899, when 19.85 inches fell; the highest in 1891, when the rainfall measured 44.85 inches. The lowest number of days in which rain fell was 48 days in 1893; the highest, 105 days, in 1894. During the last three years, 1896 to 1898, the supply of water collected by the mines' dams has been notoriously short of the actual requirements. In 1896 the rainfall was 23.23 inches, the number of stamps running was 2386, and the tonnage crushed was 4,000,000 tons; in 1897 the rainfall was 28.98 inches, while 3567 stamps crushed 5,300,000 tons; and in 1898 the rainfall was 27.25 inches, for the supply of 4757 stamps, crushing 7,330,000 tons. There is obviously no sort of correspondence between the rainfall and the increasing needs of the industry. While the tonnage milled increases at a most terrific rate, the rainfall cannot be trusted to supply even the present comparatively modest requirements. There is, of course, most rain collected in the dams in those years in which the highest measurements of rain fall within the fewest days. What the mines want is a quick succession of heavy showers with a good run-off. Unfortunately, nature cannot be expected to accommodate itself to these ideal conditions. While the needs of the industry increase with quick and regular strides, the rainfall is uncertain, and, at best, insufficient. The catch area of the mine reservoirs is, of course, a permanent superficial element which cannot be increased in proportion to the demand made upon it. Everything that can or need be done in the provision of reservoir space has already been done. Thus, the Natal Spruit dam, to take a striking case, has a storage capacity for one thousand millon gallons. The best effort of the best year's rainfall supplied it to the extent of only 450,000,000 gallons.

Every ton of ore milled on the Rand requires a water feed of at least 400 gallons of fresh water. Of this amount the mines can themselves supply only 25%, and the remaining 75%—or 300 gallons for every ton of ore milled—has to be supplied either from the rainfall as collected in dams or from other sources. During the last two years an average of 6,000,000 tons of ore has been crushed per annum, and the supply of water from the mines and their dams has been short. On the assumption, however, that the companies can just manage to provide sufficient water for the crushing of 6,000,000 tons of ore in the year, when the time arrives that 10,000,000 tons are crushed, the water required for the extra 4,000,000 tons will obviously have to be provided entirely from sources outside both rainfall and mines. At the rate of 400 gallons per ton of ore, this will mean an extra supply of water to the extent of sixteen hundred millions of gallons. In other words, an extra supply of water will have to be provided of from four to five million gallons per diem. And, if crushing operations extend beyond the limit of 10,000,000 tons of ore per annum, the extra water supply will have to be increasad in proportion. That 10,000,000 tons is not merely a fanciful measurement of the scope of operations in the near future is a contention which will be readily admitted on the Rand. Its reasonable nature can be easily illustrated. In 1898 the Rand Mines as a single corporation crushed 1,107,025 tons. Again, the companies concerned in the development of the new water supply are at present dropping 3500 stamps on properties east of the Paarl Central, there being no necessity to consider properties to the west of that company on account of adequate rainfall. But it is estimated that within five years the same companies will be dropping 12,000 stamps as compared with the present 3500 head. The estimated increase of stamps will be more than 250% within five years. The increase in tonnage crushed will certainly be in equal if not higher proportion when the possibilities of improved duty are considered. And from whatever source the necessary water is to be provided, it must needs be of a kind which will yield a supply commensurate with the enormous demand as estimated for a period extending over the next fifteen or twenty years.

In the arid regions of the southern California and Arizona deserts, where the scarcity of water has proven a serious obstacle to the development of valuable mining districts, the difficulty has been overcome in a number of instances by the installation of pumping plants and pipe lines from the source of supply to the mines and mills requiring the water. These installations have in every instance been successful where applied to quartz mining. In length these pipe lines have been all the way from a mile or less to seventeen miles, and the height to which water has been lifted in large volume has been from 200 to over 500 feet. Where a large plant is established, the cost of water per ton of ore crushed has been surprisingly small. One of the most prominent of these pumping installations is that of the Golden Cross Company, San Diego Co., Cal., whose pipe line is twelve miles in length and the lift 500 feet. Through this line 250,000 gallons of water are pumped daily at a cost of about 10 cents per ton of ore crushed. By pumping back from reservoirs near the mill this amount can be increased 50%. This amount of water on the Rand would supply sufficient water for crushing about 1000 tons of ore daily.

Diamond and Gold Mining in Minas Geraes, Brazil.

NUMBER IV.—CONCLUDED.

The second largest mine is the Passagem near Ouro Preto. This city was formerly the capital of Minas, and the region of which it is the center was the richest in Brazil. The Passagem has also been worked since the last century. The ore contains a large proportion of arsenical pyrites, and it is from this that most of the gold is obtained. The quality is variable, and the mine has had a checkered history. In 1863 it was bought by an English company, and by 1873 they had extracted 23,500 ounces from ore yielding one-fourth of an ounce per ton. This was not profitable, and the company went into liquidation. In 1884 a new company, the "Ouro Preto Gold Mines of Brazil," bought the mine, and, with better methods of exploitation and reduction, the Passagem has justified its old reputation of being one of the best in the country. The ore averages one-third of an ounce per ton.

The best example of a mine where the gold is obtained from beds of peroxide of iron, called "jacutinga," a soft friable brown mineral, is the Gongo Soco. The mine is situated about fifty miles east of Morro Velho and high up on the ridge of the main sierra. It was discovered and worked before the middle of the last century. Stories that sound like fables are told of its marvelous richness. In 1818, the Brazilian proprietor took out over 5000 ounces of gold in one month. In 1826, the mine was sold to an English company for £74,000. The mineral is found in a bed 300 feet thick, interstratified between schistose slates and limestones lying at an angle of 45°. Much of the ore was so rich that the gold was plainly visible to the naked eye. Ore of this character was detached with picks, separated and powdered by hand, and then washed in pans. This work was entrusted only to the fifty English miners imported by the company. In one instance, a miner brought out in his hat half a peck of "jacutinga" which yielded 310 ounces of gold dust. The hat must certainly have been one of the leather hats so universally used in the Minas mines to-day. The bulk of the ore was crushed in stamp mills and subjected to a more complicated process than the selected portions. The upper parts of the bed were the richest, and from 1826 to 1841 the mine produced largely and at small outlay. During the following fifteen years the production decreased and the expense grew on account of the flooding of the mine. It was at last abandoned in 1856, after having yielded 400,080 ounes of gold for a total outlay of £989,000. During the early and profitable period the Government levied a tax of 25% of the gross product, and the company paid into the imperial and provincial treasuries over £333,000.

The Maquine mine, near Ouro Preto, the Pitangui, Cocaes, Boa Vista, and Morro das Almas, all near each other and twenty miles south of Santa Barbara, were other "jacutinga" mines of considerable value. None of them are being operated at present. Besides the Morro Velho and Passagem, there may be mentioned among the quartz and pyrites mines that of Pari, to the east of Santa Barbara; Catta Branca, directly south of Morro Velho; Cuiaba, owned by the Saint John d'El Rei Company; Faria, near the station of Honorio Bicalho, on the Central Railroad and owned by a French company; Raposos, near Sabara and belonging to the Passagem company; and Vira Copos. Most of these are in operation.

Shortly after the proclamation of the Republic in 1889, a considerable number of Brazilian companies were floated for the purpose of engaging in gold mining in Minas. The results so far have not been notable. There are undoubtedly large deposits of quartz and "jacutinga" yet unexplored, or which have not been worked because they have been covered up by early operations. Difficulties often arise on account of the impracticability of obtaining available water power sufficient to keep the mines free from the great quantities of water encountered in Brazilian mining. No coal is mined in Minas, and freight rates do not permit its importation so far inland; consequently, steam is unavailable for pumping, and there are no smelting works. Little Brazilian ore is free milling, and that which is not must be reduced by chemical processes. A large development of the mining industry of Minas is probable, but those alone who employ the safest and most scientific methods of exploration and installation, and who command large capital, can reasonably hope to be successful. Mining in Minas offers few inducements for small prospectors.

The legislation in regard to the acquirement of mining property now in force is liberal, and the restrictions and formalities imposed are few and reasonable. The owner of land has the first right to the mineral; but if he does not exercise it, others may explore, after giving notice. The discoverer of mineral is entitled to four lots of fifty meters square, with ground necessary for working. Claims are freely transferable, but no single person or company may own more than 100 contiguous lots. Abandoned claims revert. The most onerous burden is the State export tax, amounting to 5% of the gross product. The larger mines can not escape the payment of this tax, but there is much illicit exportation by small operators. This fact makes the gathering of complete statistics impracticable.

Fairly complete statistics exist of the amount of taxes collected in colonial times. Since the Government took one-fifth of all the gold produced, the computation is easy. The output of the larger mines in this century is also known. The contraband production of the last century and that of the smaller private mines in this can only be estimated. The gold production of Minas has been approximated as follows:

Years, inclusive.	*Ounces per year.*	*Total ounces.*
1700–1713	10,000	140,000
1714–1724	90,000	1,089,000
1725–1735	135,000	1,350,000
1736–1751	303,000	4,850,000
1752–1766	302,000	5,120,000
1767–1777	230,000	2,530,000
1778–1808	140,000	4,340,000
1809–1834	34,000	890,000
1835–1890	58,000	3,250,000
1891–1898	75,000	600,000
Totals	121,000	24,150,000

Other Minerals.—Next to gold and diamonds, the manganese mines are at present the most important in Minas Geraes. They are near the town of Miguel Burnier, 311 miles from Rio de Janeiro, on the Central Railroad. The ore is of good quality, containing 84% of oxides of manganese. It is extensively shipped to the steel mills of Europe and America, and these mines are among the most important sources of this mineral, so essential to modern steel making. The best known mine, the Usina Wigg, shipped 20,000 tons to the Carnegie Steel Co. of Pittsburg in 1896 and 1897.

Minas Geraes contains inexhaustible deposits of excellent iron ore, but the lack of coal prevents its being used, except for the manufacture of soft charcoal iron. Niter is found in considerable quantities in many localities. It has been commercially mined for over a century. Mica, graphite, topaz, beryl, chrysoberyl, andalusite, rock crystal, coal in thin seams, and building stone in great variety are found to exist in this State. Specimens of all these and of many others less important may be seen in the museum of the School of Mines at Ouro Preto. Probably no part of the world contains such varied mineral wealth as the State of Minas Geraes. It is worth the practical investigation of American engineers and capitalists.

Some Experiences of a Working Miner.

NUMBER XXIII.

Written for the MINING AND SCIENTIFIC PRESS.

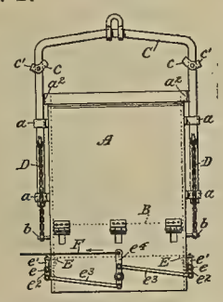
One day while standing on the street in D—— I noticed the general manager of a wealthy mining corporation approaching. At the same moment I observed a man whom I knew to be a prospector emerge from a saloon, and a moment later intercept the mining man, Mr. M——. He was not always an easy man to approach, but in this case he stopped and listened attentively to what the man had to say. His remarks were too low to be heard from my standpoint, but it was soon quite evident he was talking about a mine, for he produced from his pocket a small piece of ore and proceeded to describe the claim. From his gestures I concluded he must have a very large mine and the small sample was evidently rich ore. As I have already said, I could not hear what he said, but the remark of Mr. M—— I heard readily. He suddenly interrupted the prospector with the remark: "Don't you know you're lying? If you had a mine like that I would give you $2,000,000 for it." Having heard this remark and seen M—— walk away, leaving the prospector staring after him, I could easily imagine what he had been saying. That is the trouble with most prospectors. They are expected to present a roseate description of their property, but it is often so completely overdone that the man whom they endeavor to interest in the proposition not only disbelieves the story, but becomes angry to think that any one would take him for such a fool as to believe it.

* * *

Mr. C—— concluded to mine. He bonded the L—— mine and spent considerable money on it—that is, he furnished considerable money, which was spent by someone else. He never would go down into the mine, partly because he was afraid and partly because he had sense enough to know he would be in no way wiser for going. He spent his time on the veranda of the boarding house, playing pedro. The mine was run for some months and C—— lost all he put into it, and now he condemns all mining ventures as hazardous and illegitimate—says all miners are robbers, and would go to sleep on shift.

* * *

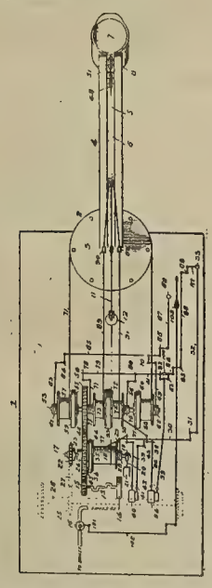
There are men who will listen to no argument and will receive no statement as true from another until



they have demonstrated it to their own satisfaction. Such a man was I——. He was one of a large force of men working at the B—— mine. One day at noon the miners were discussing the force of nitro powder. Some of the men claimed a concussion would set it off; others claimed concussion accompanied by fire was essential. I—— held to the latter belief and offered to prove it. One miner inquired in what way he intended to demonstrate his theory. I—— replied that he would cut off a piece, place it on an anvil and strike it with a hammer, and it would not explode. As he went about it a dozen men protested and warned him, but others, thinking to see some fun, remarked that of course I—— was right and he could easily prove it. He cut a good sized slice from a stick of No. 1 powder, placed it on the anvil, when someone suggested that he had better put it on an old tappet lying out on the dump. He followed the advice, for a wonder, and, laying the powder on the tappet, struck it a heavy blow with a striking hammer. The hammer flew 30 feet into the air and I—— went head over heels over the dump, finally bringing up in a clump of chaparral. The men, who had quickly retired when they saw he intended to put the experiment into execution, ran forward and saw I—— slowly climbing up the hillside, limping and holding onto his right hand at the wrist. He had sprained it so badly that for a time it was thought the bones were fractured or dislocated. He now knows, and has proved to his own satisfaction, that nitro powder can be exploded without fire.

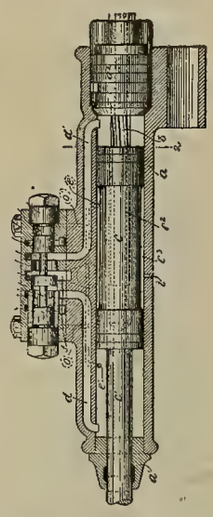
Latest Mining and Metallurgical Patents.

Patents Issued June 27, 1899.



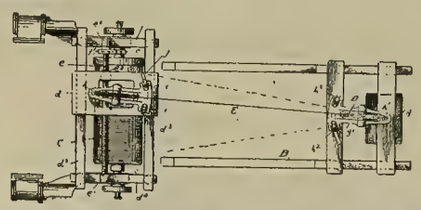
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

DUMPING BUCKET.—No. 627,306; J. F. O'Rourke, New York, N. Y.



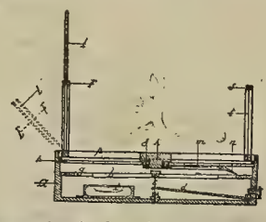
The combination with the body of a bucket and a door forming the bottom thereof, of a bail moveable with respect to the body, a loose connection between the bail and the door whereby the bail in its upper position supports the bucket through connection with the door, and means to connect the bail directly to the body, whereby the bail in its lower position supports the body directly and leaves the door free. A loose connection between the bail and the door, and a dog or latch carried by one of parts to engage the other in the upward movement of the bail. Means to connect the bail directly to the body, a latch to engage the door, and means to disengage the latch.

STEAM DREDGE OR SHOVEL.—No. 627,662; G. E. Turner, Marion, Ohio.



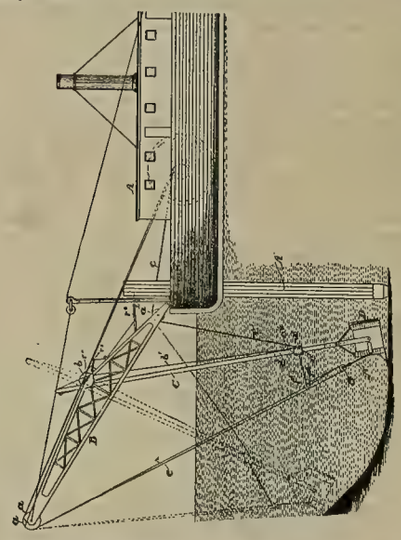
The combination in a dredge, of the shaft 17, the drum 18, the brake band 35 encompassing drum, the steam cylinder 40, having its piston rod operatively connected to brake band 35, and means for simultaneously operating piston rod and connecting or disconnecting drum and the power shaft, the drums 73, 74 mounted on the shaft 53, and the hand lever 33, operatively connected to drums 18 and 73, 74; the bucket 7, the door 8 hinged thereto, the spring-actuated latch 9, the lever 10 pivoted to latch, the flexible rope 11 connected at one end to lever, the weight 12 fixed to the other end of rope, and a shelf support arranged in the path of weight.

VALVE FOR ROCK DRILLS.—No. 627,703; T. Officer, Claremont, N. H.



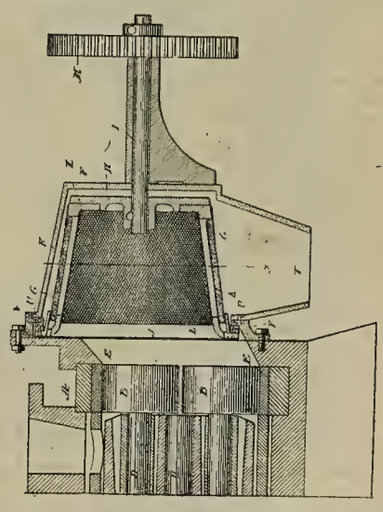
In valve mechanism, the combination of a cylinder having inlet and exhaust ports, a piston, a piston valve controlling ports, valve having pistons at each end thereof and a single one intermediate thereof, intermediate piston being of greater area than either of the end ones, and cylinder having reversing ports in the upper and lower portions thereof leading to the lower and upper ends respectively of piston valve, whereby piston valve is unbalanced when the piston passes the reversing ports.

HOISTING MACHINERY.—627,769; H. C. Behr, San Francisco, Cal.



In a hoisting apparatus, the combination with the winding drum, of a sheave mounted so as to be free to swing with the deviation of the hoist or winding rope, a traveling carriage to which the sheave is pivoted, and of mechanism for imparting travel to the carriage as the rope is wound on an off the drum; sheave frame pivoted in close proximity thereto, a sheave mounted therein, the sheave frame being free to swing with the directing strain of the hoist rope upon the sheave, and of mechanism for imparting lateral movement to the sheave frame as the hoist rope is laid on and off the drum; the sheave frame pivoted so as to adjust its plane in the direction of the rope leading from a shaft, a sheave mounted in frame which leads the rope to the drum, mechanism by means of which the sheave frame is caused to travel in correspondence with the laying on or off the rope, and of a guide or pit head sheave mounted to swing about a fixed axis.

FOLDING MINF TRANSIT.—No. 627,638; J. A. Birsfield, Denver, Colo.



An instrument of the character described, the combination of the needle compass, the level or bubble glass, the vernier arranged on a central axis, and the folding or hinged sights, one of sights having a sliding mirror adapted to be projected beyond the normally upper end of sight, and retractible to permit of the folding of sight; parallel crossbars, the axis depending centrally from crossbars, the vernier arranged on axis below, crossbars having a deflected graduated portion, and the hinged or folding sights arranged between parallel bars, at their end; the graduated compass circle arranged below vernier, a transparent plate or portion interposed between crossbars and vernier, the bubble glass, needle playing in connection with compass circle and hinged or folding sights arranged between parallel bars, at their ends, adapted to fold flush with axis.

DREDGING APPARATUS.—No. 627,660; A. K. Stone, Boston, Mass.

A dredging apparatus; a boom; a main and an auxiliary chain or cable; a block carried at the end of auxiliary chain or cable; a bucket having an attached block over and about which main chain or cable is passed, chain or cable being attached to the block carried by auxiliary chain or cable; means to wind main chain or cable at a slow speed and to thereafter wind both chains or cables at a faster speed; a bucket beam, a pawl carriage, a carriage mounted thereon, pawls to hold carriage in adjusted position, friction drums mounted on boom, chains or cables connected with bucket beam extended about the friction drums mounted on boom, attached adjustably with carriage, whereby carriage may be raised or lowered on beam according to the depth of cut to be made by bucket; and backing-off chain connected with block carried by auxiliary chain or cable, and extended through carriage, and a drum to wind at proper times backing-off chain, as when the block connected with the auxiliary chain or cable is to be pulled to the block connected with the bucket.

PULVERIZING MACHINE.—No. 627,579; G. Frisbee, Philadelphia, Pa.

In a pulverizing machine, in combination, a pulverizing chamber, a stationary ring die and revoluble rolls therein, and a discharge apparatus comprising one or more cup-shaped screens located adjacent to one end of the pulverizing chamber and mounted upon an independently revoluble frame, the lower edge of screens being above the lower inner edge of ring die; a casing surrounding screening apparatus, a discharge spout for pulverizing material, and return passages for unpulverized material.

COPPER does not show, as yet, as material an increase in production as might have been anticipated under the impetus of high price. A large number of mines in various parts of the country, however, are making rapid preparations to commence production at the earliest possible day, and some of these are evidently destined to become large producers for a time. Should the present price be maintained, or a price near it, the year 1900 will see a large increase in the output of this valuable metal.

Scale of Wages in Colorado.

Answering inquiry on this subject, the following is the prevailing scale in Cripple Creek district, which, with some exceptions, is the same as that adopted in other camps of the State, wages being based upon an eight-hour day, except that of assayers:

Hand drillers	$3 00
Machine drillers	4 00
Machine helpers	3 50
Trammers	3 00
Pumpmen	4 00
Top cagemen	3 00
Master mechanics	4 00
Shift bosses	4 00
Superintendents	7 00
Engineers	4 00
Firemen	$3 00 to 3 50
Carpenters	3 50
Timbermen, underground	3 00 to 3 50
Blacksmiths	4 00
Blacksmith helpers	2 00 to 3 00
Laborers, surface work	3 00
Assayers, mine work	5 00

A baby machine driller gets $4 for eight hours, but he is his own mucker. Muckers back of large machines get $3 for eight hours.

In some of the wet and deeper mines hand drillers get $3.50 for eight hours, the men furnishing their own gum coats, boots, hats, etc.

Unlawful to Use Metal Tamping Bar.

TO THE EDITOR:—Please state in your next issue if there is any law in Colorado against using a steel or iron tamping bar in loading holes. MINER.

Globe, Ariz., June 20th, '99.

The fourth article of section 20 of the Colorado State laws governing the Bureau of Mines is as follows: "No person shall, whether working for himself or in the employ of any person, company or corporation, while loading or charging a hole with nitroglycerine powder or other explosive, use or employ any steel or iron tamping bar; nor shall any mine manager, superintendent, foreman or shift boss, or other person having the management or direction of mine labor, allow or permit the use of such steel, iron or other metal tamping bar by employes under his management or direction."

Recently Declared Mining Dividends.

American Zinc Co., $1 per share; payable July 15.

Industrial Notes.

—The cut in freight rates from the Atlantic to the Missouri river has got as far west as Utah.

—The total assessed valuation of the city of Los Angeles, Cal., in 1898 was $61,099,307; in 1899, $65,127,662.

—The Mercantile Trust Company of San Francisco has taken $1,000,000 of the bonds of the Yuba, Cal., Electric Power Company.

—The transportation of minerals and mineral products constituted 46% of the entire traffic of the Mexican Central railroad in 1898.

—The U. S. Navy Department has given the contract for the Mare Island, Cal., drydock to the Atlantic, Gulf & Pacific Company for $729,000.

—It is stated that the tramways of the Chilkoot pass route from Dyea to the Upper Yukon lakes are to be bought by the White Pass & Yukon Railway Co.

—The contract for the construction of the Government building at San Francisco of Raymond granite has been awarded to the Bentle Construction Co. of Milwaukee, Wis., at $802,500.

—All the tin plate works in the country were closed at midnight on the 30th ult., as a result of the failure to settle the wage scale at the conference in Chicago. Fifty thousand persons will be made idle by the shutdown. The Workers' wage committee made a demand for an advance of 20%. The present wage scale expired on June 30.

—Col. B. F. Allen, supervisor of the five forest reservations of southern California, has from the Federal Government an allowance for the fiscal year beginning July 1 of $15,000, which will enable him to do more effective work than heretofore. He selects men to act as rangers on the reservations. There are now thus employed fifty men.

—At Visalia, Cal., electricity generated at the Mount Whitney power house has been turned on. The power is supplied by water from the east fork of Kaweah river, diverted at Oak Flat, forty-five miles from Visalia, at an altitude of 2400 feet. The present capacity generates 1800 H. P. Power is transmitted to Porterville, forty-three miles.

—The Clear Lake, Cal., Electric Power Co. estimates the entire cost of the installing plant, ready for operation, at $656,095.07, including $108,800 for a reserve steam plant. The annual operating expenses, exclusive of the steam plant, are estimated at $55,490; the cost of operating the steam plant three months, $28,670. It is calculated that operating the plant at its full capacity, 4000 H. P., will bring an income of $228,000. The company proposes to issue $850,000 in 6% bonds to cover the construction and furnish a reserve fund.

—Consul General Gowey writes from Yokohama: "The customs returns show that during the year 1898 there were imported into Japan 234,941 pounds of copper plates, sheets and rods, valued at $29,243, and 94,925 pounds of yellow metal sheathing, valued at $9970. What proportion of rods were included in the foregoing the returns do not indicate. Under the heading of exports, copper sheets and plates do not appear, but of refined copper there were shipped abroad during last year 35,709,650 pounds, mostly in the shape of slabs and ingots, valued at $3,553,245. Exports of manufactures of brass at the same time were valued at $9856. The efforts made to produce sheet copper in Japan, I am informed, have not been encouraging and the press has reported the failure of one of the largest concerns in this line of trade at Osaka. Japanese copper, while of fine appearance, has produced much dissatisfaction as sheathing on vessels—salt water destroying it in a very short time. For Muntz metal, or its equivalent, there is undoubtedly a growing market in the Orient."

—At the close of the recent session of the Transmississippi Congress, T. C. Henry of Denver, Colo., in his speech, claimed that the intermountain States and Territories are retarding and losing population because of excessive and unjust freight rates, depreciation of mining properties and products generally through monetary conditions. The checkered progress and deterioration he ascribed wholly to the effect of the "long-haul" rates of the far-off East and West coast railroad lines, thus causing agricultural and manufacturing in the interior to be comparatively unprofitable. He made no reference to monetary conditions or to the mining interests.

—H. R. Robertson tells *Wood and Iron* that the Stella lumber raft, which is to go out from Washington by sea to San Francisco, is being built in a cradle 96 feet long and will contain 550,000 lineal feet of logs. These, computed to board measurement, make 6,000,000 feet of lumber. The two building on Puget sound are each 144 feet long, and each will contain 750,000 lineal feet, or 9,000,000 feet of lumber. No saw logs are contained in these rafts; they are constructed entirely of piles and spars. The Southern Pacific has just given him a $60,000 order for logs to be used on their lines in California. He says that sawmills will be erected in San Francisco for the purpose of turning log rafts into lumber piles.

—According to newspaper statements, Manager Shelby of the Pacific & Idaho Northern Railway is trying unsuccessfully to secure 500 workmen on Puget sound for his Idaho railroad. Shelby's new railroad is being constructed from Webster, Idaho, northward into the Seven Devils copper region, a distance of over 100 miles It is projected farther into the Buffalo Hump mining country and the White Pine region of Idaho. The Pacific & Idaho Northern will connect at Weiser with the Oregon Short Line. Another railroad will penetrate the same region from Huntington by following down the Snake river, while Shelby's road goes up the Weiser river. It is noticeable that these two streams run parallel to each other for nearly a hundred miles and yet flow in opposite directions.

—The Great Northern and Northern Pacific Railway traffic officials, in the application of the Pacific coast hardware jobbers for the cancellation of their present tariff on less than carload lots, have decided against the Pacific coast jobbers, and the present tariff will remain in force. The decision is the result of an appeal by Pacific coast men at the hearing held in St. Paul in May, and which was strongly contested by jobbers from St. Louis, Chicago and other Middle Western cities. The decision concludes thus: "We do not feel that we can successfully defend the position advanced by the Pacific coast jobbers; that its adoption would not be for your best interests or our own." The rate objected to by the Pacific coast jobbers was one which reduced by about 50% the difference that had previously existed between carload and less than carload rates on certain kinds of freight. For example, the less than carload rate on certain hardware was $2 per 100 pounds, and the rate on the same freight in carloads was $1.50 per 100. This was adopted at the Milwaukee meeting in April, 1898, and it was supposed to represent the difference in cost of handling the freight in full carloads or in small, broken lots. This difference gave something of margin to the Pacific coast jobbers, who shipped in large quantities from the East and distributed here to the retailers. Those rates had been in operation scarcely a year when the Northern lines cut the rate on less than carloads from $2 to $1 75, leaving the difference between the two but 25 cents, whereas it had previously been 50 cents. This was believed to be in the interest of St. Paul jobbers, who had laid in enormous stocks of the goods chiefly affected by the new tariff. The difference of 25 cents per 100 pounds was sufficient to give the St. Paul jobbers an advantage in certain territory, and the Pacific coast people objected and sent a large delegation to St. Paul to lay the matter before the traffic officials of the two Northern lines that had brought the change.

Personal.

JOHN FILLUS of Boston is in Redding, Cal., representing an Eastern mining company.

GEO. W. HEINTZ succeeds F. A. Wadleigh as general passenger agent Rio Grande Western Ry.

FRED H. HARVEY of Galt, Cal., has charge of the present work of the Jupiter Con. M. Co., Iowa Hill, Cal.

W. F. STUART has been appointed general manager of the Mountain mine in Sierra county, Cal.

F. GUITERMAN, formerly of Durango, Colo., is now Mgr. Pueblo, Colo., plant of the American Smelting Co.

F. H. NEWELL of the U. S. Geological Survey is examining the water storage possibilities at Phœniz, Arizona.

J. P. HARVEY, who has been Mgr. Republic mine from its start, has resigned, being succeeded by R. G. E. Leckie of Montreal.

FORREST FARNUM of Grass Valley, Cal., has gone to the Four Hills mine in Plumas county, Cal., where he has been engaged as foreman.

ON the 1st inst. Ralph Nichols, formerly of DeLamar, Nev, assumed the management of the Great Boulder mine, at Kalgoorlie, Australia.

Obituary.

ON the 3rd inst., there died in San Francisco an old-time miner, who was as great a hero as any ever pointed out by the flashing finger of Victory when cannon thundered over conquered field—reference is made to Roger Prendergast, an old California and Comstock mine foreman, who time and again was foremost in saving life when the mines where he was employed were afire and men were smothering in the lower levels. The last of a list of heroic and successful efforts to save life was at the Chollar fire, Virginia City, Nevada, where in rescuing some of the imprisoned miners he inhaled a deadly gas that ultimately caused his death. There was no parade about his life; there was little pomp or ceremony about his funeral, yet when old Roger Prendergast was buried the sods were piled above the remains of a typical miner and a brave man.

Leffel Class "B" Standard Center Crank Automatic Cut-Off Engine.

The accompanying illustrations represent the Class "B" standard center crank automatic cut-off engines being put on the market by James Leffel & Co., Springfield, Ohio. They are intended to meet the demand for a thoroughly good, simple and easily cared for line of automatic engines in the smaller sizes up to 50 H. P., that will prove durable and economical in operation. Fig. 1 is view showing cylinder side; Fig. 2 illustrates the governor of the band flywheel. The main frame or bed is of substantial proportions and of a design affording extra strength and stiffness. The cylinder and steam chest are of overhanging type, cast together and firmly bolted to bed. Cross head guides are a part of bed, bored out, and have very generous surface. Cross head is of improved mechanical design, having pin about mid-center and provided with gun metal wedge-shaped shoes above and below, arranged for convenient adjustment. Manner of fitting cross head pin enables easily keeping same absolutely tight at all times. Piston rod is of steel, and turned to a tight force-fit in piston, with suitable shoulder, against which piston is forced on rod, and end of latter is then securely riveted over, tightly and firmly holding piston in place. The connecting rod is provided with extra heavy brass boxes at each end, easily adjustable for taking up wear and keeping distance between centers same at all times. Main shaft is extra large and strong, forged in one solid piece from best quality hammered iron or steel, and is provided with suitable counter-balance discs, securely attached. The rectangular form of skeleton slide valve is used, balanced by being fitted with a pressure-relieving plate on back between valve and steam-chest lid, and is arranged to afford necessary relief in case of water in cylinder, and also made adjustable for wear. This gives a simple, efficient and well-balanced valve, that is easily understood, and no more trouble to care for than the ordinary type of plain slide valve. A simple and convenient device (not shown in cuts) is provided for draining cylinder, same being operated by one lever, and having outlet from each cylinder cock suitably connected to exhaust pipe.

These engines are equipped with the Rite's governing system. The governor consists of one piece, comprising the arms and weights, with one spring connection, and is pivoted on one hardened steel pin—nothing complicated, no links, no numerous joints or complicated parts. This governor, with the balanced valve used, affords a regulation that is practically perfect, speed being constant, and the same with engine loaded or running empty.

The manufacturers will be pleased to quote prices and furnish prospective users with any additional information desired regarding these engines.

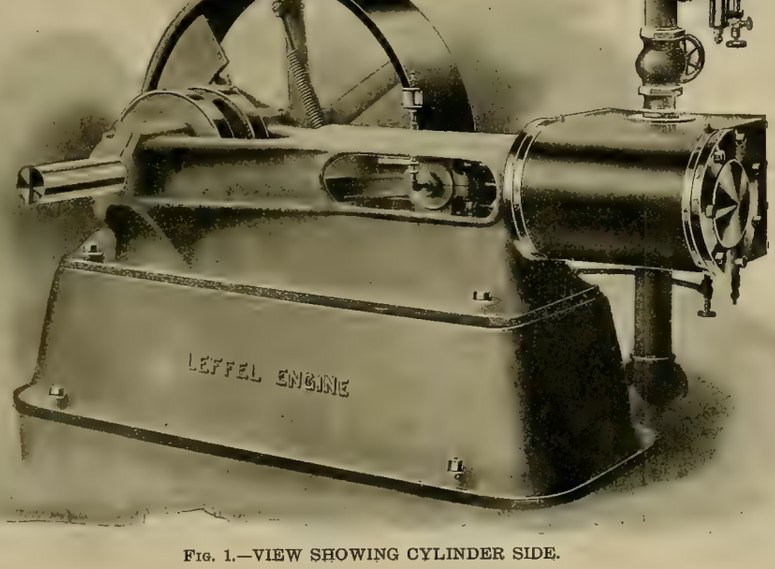


FIG. 1.—VIEW SHOWING CYLINDER SIDE.

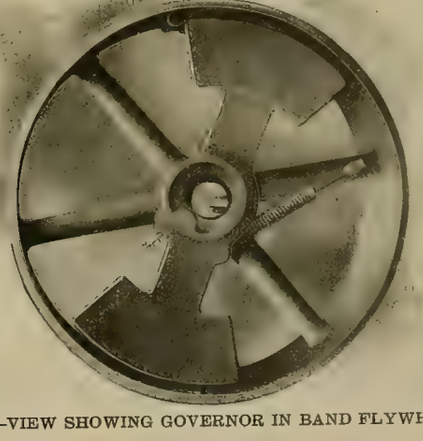

FIG. 2.—VIEW SHOWING GOVERNOR IN BAND FLYWHEEL.

Notes on the Alleged Shortage in Cyanide Bullion.*

By C. W. MERRILL, Assoc. Inst. M.M.

The impression that the bullion returns from cyanide plants are, in spite of the observance of all possible precautions, uniformly less than the correct tonnage multiplied by the difference between the values per ton indicated by assays of the "charges" and "residues," seems to have become so general that it was thought that a brief explanation would be of interest.

Figures have been made on results of operations from July, 1897, to November, 1898, of the tailings plant of the Montana M. Co., Ltd.,† the capacity of which is 12,000 tons per month, which was installed and operated under the writer's supervision, and which has been working during all but the severest weather between the dates named, it being impossible to economically handle the store tailings in midwinter, the thermometer sometimes dropping as low as 50° below zero in this northern latitude, and the tailings freezing as hard as sandstone to a depth of several feet from the surface in consequence. The plant was, however, operated for a short period during November, 1898, when the thermometer ranged from zero to 15° below.

About 135 truck or car loads of tailings are hauled to the bins daily, each car containing approximately three tons of sand. From six to ten of these are weighed, and large samples are taken from each of the cars so weighed. The accumulation of these car moisture samples gives the daily average moisture sample. From the number of cars dumped, the average weight per load and the moisture percentage determined from the average sample is figured the number of dry tons treated daily.

The sand passes from the cars to the bins and is withdrawn by a 24-inch belt conveyor, one of which discharges into a rotary distributor over the center of each sand vat. The stream of sand as it leaves the belt is sampled three times per hour during nine hours, which period is the average time consumed in filling a vat with 400 tons of tailings. The large "charge" assay sample so obtained is quartered down and four assay tons of the dried sample are taken for duplicate melts and weighings of gold and silver, care being taken that the lead buttons from each melt of two assay tons shall weigh approximately thirty grams. If the variation in the weights of gold obtained from these two melts of two assay tons each does not exceed $\frac{1}{10}$ milligram (equivalent to 20 cents per ton), the average is taken as representing the value per ton of the tailings charged that day; otherwise the assays are repeated in duplicate until such a concordance of weights is obtained.

After treatment the residue in the vat is sampled by removing sixteen cores from top to bottom by means of the sampler. The sample thus obtained, weighing several hundred pounds, is in turn cored with a small tryer, yielding about twenty pounds of residue, which is dried, mixed and quartered for the final assay sample. Of this, eight assay tons are taken for assay, the dore buttons from each melt of two assay tons being weighed separately and parted in pairs so as to give duplicate gold weighings from four assay tons each. If these weighings differ by more than $\frac{1}{10}$ milligram (equivalent to 10 cents per ton) the assays are repeated. All gold weighings are made on an Oertling 12A balance, sensitized to $\frac{1}{100}$ milligram.

The total amount of unprecipitated or pregnant solution flowing from the sand vats daily is measured, sampled and assayed, as is also the corresponding precipitated or barren solution.

Of the unprecipitated solution from four to eight assay tons are measured and evaporated in small bulk in ordinary saucers standing on a hot plate. Each saucer holds five or six assay tons, if larger volumes require to be taken a corresponding number of saucers are used and the contents, when sufficiently reduced, are poured into one. A mixture of litharge, silica and charcoal is then added and the whole heated till dry, when the contents of the saucers, after cooling, are mixed with sodium carbonate and charged into a crucible. Any residue adhering to the saucers is moistened with dilute nitric acid and taken up by a small piece of filter paper, which is then sprinkled with litharge and added to the crucible. The mixture is then melted, the resulting lead button cupelled, and gold and silver determined. Duplicate solution assays are not usually made, but when so made the results almost invariably agree very closely. The sodium carbonate is not added to the solution with the rest of the flux, because it would cake on the inner surface of the dish and make the mixture difficult to remove. Of the precipitated solution, from eight to twenty-four assay tons are similarly prepared for the furnace, as many as forty assay tons being occasionally taken.

These solution assays are of great practical utility, not only as guides to the efficiency of the precipitation, but also as giving warning of the presence of reducing material in any charge several days before the residue from such a charge is available for assay, and they are made primarily for these reasons.

The monthly bullion assays are made with the usual precautions, including determination of the cupel absorption, check for volatilization of silver, etc. The shortage of bullion in the first cleanup is usual in cyanide plants, the deficiency being made up in the succeeding months.

The output of gold determined by daily assays of charge and residue was seen to be $276,499.70, while the gold in the bullion obtained was $284,856.35, or 3.02% greater. The silver called for by daily assays was $51,596.51, while that obtained in the bullion was $52,572.27, or 1.85% more. Comparing the total values, we find $328,096.21 called for by daily assays and $337,428.62 obtained in bullion, or an excess of 2.84% over the estimate, a highly satisfactory concordance.

The estimates of precipitation have also averaged somewhat less than the gold and silver obtained, the value of the gold being slightly greater than that called for by daily assays of charge and residue, and that of silver materially less. The deficiency in silver is partly due to the fact that the lead buttons from the solution assays, which are made primarily as guides to the efficiency of solution and precipitation, are placed in the rear row of the muffle during cupellation.

The bases of values—$20.30 per fine ounce of gold and $0.50 per fine ounce of silver—were taken for reasons of convenience in computation, their values not affecting the comparison.

The ton referred to is the United States ton of 2000 pounds and the assay ton contains 29.166 grams, or the same number of milligrams as the ton contains of troy ounces.

*Condensed from Transactions of the Institution of Mining and Metallurgy.

†A description of the plant, which has since been enlarged, appears in the MINING AND SCIENTIFIC PRESS, April 30, 1898.

Something About Explosives.

In the popular mind many erroneous impressions prevail concerning the combustion of gunpowder and the meaning of the word explosion. There are two ways in which explosive compounds are consumed. One is called detonation, which is a form of reaction, so rapidly propagated through the explosive body, that it is termed an explosive wave. By the other method, the explosive body is burned from exposed surfaces, and is merely a form of rapid combustion.

Detonative substances are usually termed high explosives. Those which burn from surfaces may be termed combustive explosives. Combustive explosives, requiring an appreciable time for their consumption, are adapted to use as gunpowder by giving the projectile time to be moved forward in the bore of the gun before the complete consumption of the charge, thus providing space for the products of combustion, and obviating dangerous pressures.

Explosive compounds contain sufficient oxygen for their own combustion, and do not require atmospheric oxygen. Black gunpowder is a mechanical mixture of combustible substances, usually sulphur and charcoal, with some salt rich in oxygen, such as nitrate of potassium, termed saltpetre. It requires about seventy-five pounds of saltpetre to supply the oxygen for burning ten pounds of sulphur and fifteen pounds of charcoal. When black powder which has been pressed into hard cakes, or prisms, is fired in a gun, the small particles of saltpetre and sulphur at the surface instantly fuse and combine with one another and with the adjacent particles of charcoal, forming sulphate and carbonate of potash, setting free carbonic acid gas, nitrogen and carbonic oxide. The sulphate and carbonate of potash may be termed the ash of the gunpowder. These solids constitute about 56% of the total weight of the products of combustion; only about 44%, therefore, are gaseous.

Smokeless explosives are compounds in which the oxygen is in chemical union with the combustible elements—carbon and hydrogen.

The products of combustion of smokeless powder being practically all gaseous, it is easy to understand why it is so much more powerful than black gunpowder.—Hudson Maxim in Cassier's Magazine for July.

The Source of Gold.

TO THE EDITOR:—For several years miners worked the placer mines in a region which had never been surveyed. I was one of the number. There were some very peculiar things about the distribution of gold in the various gulches. One gulch would have a comparative abundance of gold and the next one to it would have little or none. The gold was found in the bottoms of the gulches and upon high bars along the principal streams. Much of the gold was coarse. So irregularly was the gold distributed that all were puzzled to account for the source of the gold. Many of the miners thought it came from a great distance—forty or fifty miles—and many were the prospecting parties that went off in the direction of the limestone range to find the source of the gold. One day I chanced to climb a very high hill, from the summit of which I obtained a magnificent view of the country for miles. As I sat and looked over the rugged hilltops, I thought how interesting a map of the country would be, and determined to make one. The work was commenced and required some time, and, when completed, it was only a good sketch map at best; but this map demonstrated some facts in the distribution of the gold. On it were marked all of the principal streams, with their sinuous courses and many of the tributaries. The quartz mines occurring in the region were also indicated on the map. It was then observed that the quartz veins occupied a belt about one mile wide and traversed the map in a northwesterly direction across the twenty miles of territory included in the map. Every stream or gulch, without exception, which headed in this great gold-bearing zone contained placer gold. Those streams which headed west of the belt and flowed westerly contained no gold. Those which headed west of the belt and finally entered and crossed the belt were not gold-bearing until they had entered the belt. Those streams heading east of the belt and flowing easterly contained some gold, but were, generally speaking, poor pay. Some of the streams were very crooked, and one, heading within the belt, flowed westerly, turned south and back to the east again; this stream was very rich, particularly when it reentered the belt. These facts demonstrated to my satisfaction that the gold belt was the source of most of the gold in the district and that the forces of erosion had worked from west to east. That found in the high bars along the principal streams may have been partly derived from more distant sources in the early history of those streams. A correct map of a mining region often throws light on perplexing geological problems. OBSERVER.

Rapid City, S. D., June 27th, '99.

Water Power Electric Plants in the United States.

B. C. Washington, Jr., of Washington, D. C., read a paper recently before the Electrical Section of the Franklin Institute, at Philadelphia, entitled "Water Power Electric Plants in the United States."

He gave a historical resume of the application of water power for operating machinery, and its recent application for driving dynamos. He also spoke of the development of water wheels from the crude devices of the ancients to those of the present time which have attained the maximum of efficiency. Methods for determining what water powers should be developed were explained, and the advantages of the electrical transmission of power were fully exploited. Attention was called to the possibility of developing water powers that are remote from manufacturing or mining centers.

The conditions which regulate the use of different styles of water wheels and the proper means of connecting them to the generators were also stated. Mention was made of water wheel governors and their value for regulating water wheels when there are variable loads on the generators.

He then stated his views concerning the proper kind of generators to use, and rules to be followed in building transmission lines. With a few remarks relative to insulators and transmission wires, he took up the description of such plants as the Folsom-Sacramento, Cal., transmission, the Newcastle-Sacramento, Cal., transmission, the Provo-Mercur, Utah, transmission, and the Mechanicville-Schenectady, N. Y., transmission. Then followed short descriptions of the equipments of a large number of transmission plants illustrating the various applications of electricity for mechanical purposes.

The subject was fully covered and illustrated by lantern slides, which showed almost the entire hydraulic and electrical equipment of four transmission plants. Sectional and plan views were shown of dams, views of the head gates, power houses, water wheels, water wheel governors, generators, switchboards, transformers, transmission lines, and substations and their equipments.

Views were shown of vertical and horizontal turbines and impulse wheels, operated singly or in numbers, direct connected or belted to generators or operating shafting with pulleys and friction clutches.

To cover the applications of electrical power views were shown of electric motors operating mining hoist, mining drill, ore crushers, ore roasters and converters and cotton mill machinery.

Due attention was called to the great value of water powers, and the fact that a great many powers of commercial importance were now allowed to go to waste.

As the result of Mr. Washington's investigations, he stated that there are nearly 500 water power electric plants in the United States, representing an aggregate investment of over $60,000,000; that the total H. P. represented by water wheels in these plants is upward of 200,000; that these plants furnish electricity for 28,000 arc lamps, 60,000 H. P. of motors used for manufacturing, mining and other purposes, and besides this supply current for the motors on the cars operated on 610 miles of electric railways.

In conclusion, he states that the utilization of water power for generating electricity for transmission has made possible the reduction of low-grade ores and the building up of large manufacturing cities in localities where the cost of steaming coal would have prohibited the establishment of such enterprises.—Electrical Review.

Mining Summary.

ARIZONA.

The Phœnix mine, eighteen miles north of Phœnix mountains, is to be reopened and a test made of the ores. When formerly operated, the ore gave some difficulty in treatment, but a cyanide plant has been put in and other improvements made and the owners now expect success.

In the Mineral Creek mining district J. C. Colquhoun, Supt. Arizona Copper Co., has opened up copper prospects at a depth of 40 feet.

Yuma *Sun*: It is reported that the Nicolson G. M. Co. has sold its properties in the Cave Creek district, Maricopa county, known as the Portmanteau group. There is in sight a large amount of ore. Considerable development work has been done in past years and it is understood machinery will be erected.——Chicago and Los Angeles people have purchased the old Poihamus group of copper claims, in Seneca district, including what are known as the Gregory, Grand Cross, Garfield, Grant, Homestake, Boston and Bay State mines, owned by D. J. Shackrow and J. May. The property is an old developed mine, which has produced thousands of pounds of bullion. The price was $50,000, of which $6000 has been paid. When formerly worked the ore was shipped to Swansea, Wales.

Globe *Times*: Grading is being done north of the Old Dominion smelter for more ore bins and a new 160-ton furnace is being erected. The new smelter engine, a Corliss, 22x30, runs smoothly. The new hoisting engine at the Old Dominion mine is the largest in the Territory, and has 20x60 cylinders, is direct acting, double reel hoist, operating two flat ropes ¾x5¼, either singly or in balance, and capable of hoisting a double-deck cage with two cars from a depth of 2000 feet.——At the United Globe smelters the present month will show a good output of bullion.——The claims of W. B. Collom, T. Kavanaugh and F. Gill were bonded by D. L. Browne, although there was no ore in sight. Work was started on the Man Tiger, Kavanaugh and Collom, and a 50-foot shaft on each of the claims shows rich bodies of ore. A company has been formed to operate these mines called the United Arizona, with a capital of $2,500,000. John P. Jones is president; C. Lane and C. E. Sherman are directors. There are two bank presidents also interested.

CALIFORNIA.

Amador.

The Columbia G. M. & M. Co. has sued A. Caminetti and L. A. Gross for $50,000 damages. The complaint states that Caminetti owned the Continental quartz mine, in Drytown district, and made an agreement in 1897 to transfer it to T. B. Dillon; that the Columbia Co. became the owner of Dillon's contract and of the mine by a transaction with him, and that it expended $16,500 in developing the mine; that on May 9, 1898, Caminetti entered the mine and forcibly took possession, and that the company has since been prevented by him from doing any work there.

Jackson *Republican*: The 10-stamp mill at the Klondike mine, near Butte mountain, is running. Steam power is used.——A furnace is being built for roasting ore at Campo Seco copper mines. Operations were resumed at this mine a year ago. There is a 30-foot ledge that will go from 4% up.——At the Shenandoah the shaft is down 120 feet and at that point the vein is 9 feet thick. Mr. Thornton, the manager, has purchased machinery and is now preparing to erect a hoist.——The Ivanhoe Co., near Plymouth, has stopped its mill and discharged several men while sinking the shaft, drifting, etc., is in progress, until a large body of ore is accessible. The ore of this mine is heavily charged with iron pyrites and contains also free gold. The water pumped out of the mine contains traces of copper.——The Bay State mine, near Plymouth, was promoted five years ago and a company organized to develop the property. Work was carried on two years and a shaft sunk to a depth of 700 feet. This shaft was in the footwall and parallel to the ledge, and no crosscut was made to the ledge from the lower portion of the shaft. The work was very expensive owing to the large volume of water, and work was stopped. It was sold to Stockton capitalists, who are continuing the exploration work. They will crosscut to the vein and run drifts, and sink 300 feet more in the shaft.

Calaveras.

At the Thorp mine, near Fourth Crossing, the lessees have put in a heavy hoist and other machinery, and explain that they mean to sink from the 650-foot level to the 1500 or 1800-foot.

The Fort Wayne Gold Producing Co., J. F. Clapp, Supt., has been attached for $3000. Sheriff Thorne seized $800 in bank in Stockton, and the gold on hand. Three weeks ago Supt. Clapp went East without paying his employes, whose payday had passed. Clapp not having been heard from, the men struck and the mine shut down when two months' pay was due, and made the attachment.

San Andreas *Prospect*: Operations have commenced on the Poorman mine at Railroad Flat. Sinking and crosscutting are in progress.——Work has commenced at the Veritas mine near San Andreas. The water supply has given out, but arrangements are being made to run the mill by steam while water for the batteries will be pumped from the Ford mine and piped to the mill.

Del Norte.

Crescent City *Record*: Johnson & Burnett are running the beach mine at Gilbert creek with fair profit. Since the storms are over, they have not been hindered by the ocean. Besides gold, they save considerable platinum.

El Dorado.

The Jumper G. M. Syndicate has bought the Griffith Con., Manzanita Queen, Manzanita King, Potosi and Chollar gold mining claims, near Diamond Springs. The consideration was $70,666.

At the Marguerite mine, south of Placerville, a rich ore body was found last week in the face of the south drift at the 200-foot level. It is said that the ore broken down hung together with gold.

Placerville *Democrat*: The Esperanza, near Garden Valley, has shut down for repairs.——The new mill at the Gold Note is completed.——McGraw & Roberts have found rich ore in their Santa Clara mine, in the Kelsey district. During the past week they put forty tons through the Smith & Ranney mill and realized $400. The ore was taken from the bottom of a shaft 35 feet deep. The width of the ledge has not been determined yet, but is estimated at 12 feet.——W. Meyers put men on the Gardner Con. mine, in which he is interested. This mine, formerly known as the Van Hooker, is situated one mile north of Placerville. A milling test of ore from the surface workings yielded $18 per ton. The present underground developments consist of a 500-foot tunnel with 500 feet of drifts. They are drifting east toward the shoot from which the test was made, where they will have 300 feet of backs.

Humboldt.

At Orleans Bar, on Klamath river, sixty miles below Happy Camp, a large area of mining ground is to be worked this season by hydraulicking. A company bonded the ground several years ago and built ditches and flumes, all of which were washed out and destroyed during the winter of 1890. The ground was then patented and will be opened again. It is a rich mining section.

Kern.

It is reported that the Yellow Aster Co. at Randsburg contemplates increasing the capacity of their mill, having developed sufficient water to supply more than is needed by the 30-stamp mill.

Bakersfield *Californian*: The Golden mine is eight miles from Caliente and owned by J. B. Ferris. It was located in 1896 and for two years no development work further than that exacted by the law was done. Lately it was decided to develop it. The ledge is 65 feet in width, low grade free-milling rock, in the center of which is a 2-foot streak that carries gold in quantities and from which specimens have been taken.

Mariposa.

The business part of Coulterville was almost totally destroyed by fire on the 6th: loss estimated at $200,000.

The Mariposa estate is again reported sold; this time to Mernher, Beit & Co. and Messrs. Smith & Perkins, mine owners and operators. The property comprises 44,387 acres and includes a number of noted mines, among them the Princeton, Mount Ophir, Mariposa, Pine Tree and Josephine. These mines are reported to have produced not less than $5,000,000. The Pine Tree and Josephine mines are in such a condition as to be soon made available for production.

J. Schroeder of Sherlocks has a gold mine on his ranch in that locality which he has been working off and on for twenty-three years. The mine produces pockets of gold.

J. Waller owns a copper mine located at White Rock. Returns from the last car of ore shipped netted him $1600. He has three more carloads of ore ready for shipment. The shaft is down 90 feet.

Mono.

The Standard mill at Bodie was shut down five hours during last week, owing to the effects of the lightning. The mill crushed 217¼ tons of ore for the week. Average assay vanner tailings, $10.56. Concentrates produced, 1¼ tons; assay value, $142.74. Plate amalgam produced, 1609¼ ounces; value per ounce, $2.29. At tailings plant No. 7, 244½ tons of tailings were worked for the week. At plant No. 2, 109 tons of tailings were worked. The gross value of the bullion product of these plants for the months of April and May was $15,164.42, of which $14,476.59 was gold and $687.83 was silver. The total cost of treatment was $1200.95, or at the rate of $1.19.91 per ton of tailings treated.

Napa.

The Boston Quicksilver M. Co. has been capitalized for $1,000,000. The officers of the company are: J. Pfaff, Pres.; W. B. Buckminister, Vice-Pres. and Treas.; C. Pfaff, 2d Vice-Pres.; H. C. Buckminster, Asst. Treas. and Sec'y. The directors are: K. Hass, J. Pfaff, E. H. Mason, S. Rotshchild, C. Pfaff, A. Nickerson, W. B. Smith, H. C. Buckminster, W. B. Buckminster. Principal office of the company is at Cheyenne, Wyoming. The company has $100,000 cash capital. The property consists of 6000 acres, eighty-four of which are patented as mineral land, the balance agricultural. The mineral land covers the outcrop of a ledge for a mile; the agricultural land contains timber land and water. Three shafts have been sunk, the deepest 600 feet, and a number of levels opened. The mine has produced 107,200 flasks of quicksilver. The work of developing ore reserves has not been pushed and the amount of ore in sight is not extensive. The company expect to use improved machinery and to increase the production.

Placer.

Colfax *Sentinel*: G. McAulay, Supt. of the Mayflower mine, at Forest Hill, reports that the mine has been leased for three years to J. Finning, S. Bowman, J. G. De Bons, A. Martin, F. Smith, G. McAulay, L. Smith and J. Kelley. The Mayflower Co. contemplate the purchase of the Albrecht tunnel. If this purchase is not made a new tunnel will run, as the company owns one and a quarter miles of unworked ground on the Mayflower and Orono channels.——The Dutch Flat Blue Lead M. Co. are busy grading the foundation for a 10-stamp mill, to crush cemented gravel from their drift mine near Dutch Flat.——A. Brown is taking out pay in his river bar claim on the American river, below the Forest Hill bridge. He made one run this spring, when with two men and wheelbarrows he took out fourteen ounces of gold in fifteen days.——R. Taylor and G. Middleton, of Colfax, fourteen years old, are river-bar mining on the American near Colfax. They run the pay gravel through a rocker.

Auburn *Herald*: Prospecting is being done this season in the Meadow Lake section, in the eastern part of the county.——W. Houchin cleaned up twenty ounces the first of the week from rock taken from the extension on the Conrad, near Auburn.——J. Johnson has leased the Hathaway and has put a crew of men to work.——The Big Pine and the Crandall, near Auburn, have been bonded to Hopkins & Barnard of San Francisco.——The Herman mine, near Deadwood, is paying its usual dividends. The ledge is worked through the lower tunnel and is 5 feet in thickness. It has paid from the croppings down to the present level, 450 feet.——The Boulder shaft, near Ophir, is down 275 feet, and will be sunk to greater depth. The ledge is 2 feet wide. Last week the men struck the pay shoot. The ledge at this point is rich in sulphurets and gold.

Plumas.

Lessees are working out pillars and scaling the walls of the Plumas Eureka mine and others are picking over the dumps. The mine produced $13,000,000 during a period of forty-four years' continuous operation under various management.

Plumas *Independent*: Gold bearing gravel has been struck in the shaft of the Golden Ancient mine on Bear creek. Work in the shaft for this season was resumed a month ago. Bedrock has not been reached, but results are of encouraging character. James Challen has been connected with the Golden Ancient, Channel and other enterprises in the Bear creek country, which now promise to give good returns to himself and his associates.——Peter Hansen, while working in his mine on Big creek recently, found a nugget valued at $141.

Riverside.

(Special Correspondence).—The mines in Virginia Dale district are not working full force, owing to the great heat of midsummer, when the thermometer daily goes to about 120°. The O. K. mine is opened to a depth of 230 feet, with levels at 50, 100, 150 and 200 feet. On the 50-foot level and above the vein has an average width of 19 inches; between 50 and 150 feet it averages 30 inches, and between 150 and 200 feet it is 35 inches. There are two shafts connected by the several levels, and the circulation of air is good throughout. The formation is light gray diorite, cut by black or dark green, fine-grained dykes. Large dykes of felsite also occur in the district. Some of the veins are found wholly within the diorite dykes, others at the contact of the coarser light-colored diorite and the later dykes. Still others are found independent of dyke rocks. The veins of the district range from a small seam to over 6 feet in width. The smaller veins are usually richer. The average values are $15 to $20 for the larger veins and $35 to $100 for the smaller veins. A scarcity of water is the only drawback to the development of this region. Gasoline engines have proven efficient in running hoists and mills.

San Bernardino, July 1st, '99.

San Bernardino.

Pleuth & Connell, who are working the Waterloo mine near Calico on lease, are reported doing well. There are still good streaks in the Waterloo and large quantities of low-grade ore.

W. E. Robinson, a director of the Ivanpah Smelting Co. of San Bernardino, brought suit in the Superior Court to have a receiver appointed for the company, of which J. D. Hanbury is president. The mine is in the eastern end of the county, near Ivanpah.

Santa Barbara.

Oil mining companies are filing claims along the Santa Barbara beach. The Castle Rock M. Co. this week filed a fifty-year incorporation, with a capital stock of $50,000.

Shasta.

It is reported that this county is to have a second smelting plant. A syndicate of German capitalists, represented by G. Bayha, are to establish the new enterprise. The smelter will be located on Pit river, six miles from the Southern Pacific Co.'s line and twenty miles north of Redding.

Assessor Ludwig has raised the assessment of the Mountain Copper Co. from $350,000 to $1,066,720, being the highest valuation placed on mining property in California, the next highest being the Utica mine in Calaveras county.

Dailey Bros. own the Sunrise, Sunset and Keystone claims between Shasta and the Mount Shasta mine, which they are developing. Their camp is called Oro Vista.

Redding *Free Press*: A lease on the Clara quartz mine in Shasta mining district, owned by O. LaPlant, has been secured by J. Gilardy and J. M. Bowden.

Redding *Searchlight*: Changes are in progress at the reduction works of the Mountain Copper Co. at Keswick. Two stacks are under way. A brick stack which, when completed, will be 12 feet across and 160 feet high will replace the present smaller one on the roasters. The second stack is of iron and will be 9 feet across and 140 feet high. The stack is equipped with dust chambers and waste from this source will be overcome. In the past the slag from the ore smelted was granulated in a stream of water and carried down the creek. An elevator is being erected and the slag will be loaded into cars to be dumped on the ground adjacent to the main track. Evidences of the fire of May 11th are almost entirely effaced. The engine is again employed on the road. It was repaired in the company's shops. The new shops are of corrugated iron. The largest is 60x220 feet and contains improved machines for iron work and specially designed machinery. The foundry is also complete. These shops construct and repair everything about the plant and at present are building the 600-ton furnace. Seventy-five skilled mechanics are employed.

Sierra.

M. H. Callaghan has men employed at his recently acquired gravel mine. They are working by the dry washing process and, it is reported, doing well.

The Butte mine near Sierra City has resumed operations.

W. Gillingham began work at the Chipps mine last week with eight men.

It is rumored that C. D. Lane of Angels, Cal., has bought the Young America mine and three-fourths of the Mountain mine near Sierra City.

Siskiyou.

Yreka *News*: It is reported that H. H. Hunter has bonded his copper claims at Happy Camp.——F. Brandenburg reports having found a cinnabar ledge on Young creek, near the Klamath river.——Parties from Colorado have purchased the interest of Hunter and Fry in the Cherry Hill mine.——Supt. Stevenson has erected a hoisting plant on the Nebrass property, which adjoins the Blue Gravel.——Cleaning out and repairing has commenced on the Old Craggy quartz mine, to be followed by development of the lower adit level.——Ore from the Merrimac mine, in Humbug district, is being crushed at McCook's mill at Brownsville.——Work at the Cope mine, in Greenhorn district, is progressing under new management. The milling plant is modern. Thousands of dollars have been extracted with the aid of a hand mortar.

Yreka *Journal*: There are, all told, 225 stamps and two rotary mills in Siskiyou county. Of this number 150 stamps are in operation, as much as the water supply of the properties will permit. Forty stamps are idle from various causes. The remaining thirty-five stamps are worked occasionally, doing custom work. Of the total 225 stamps, 100 are in the Salmon river country, as are also the two rotary mills. Not one of the stamps in that district is idle, and several arrastras are kept busy in same locality. Of the forty stamps now idle, fifteen are to be started. The 225 stamps are divided among thirty-two mines. The Black Bear and Gold Ball have the largest number. A number of new mills are in contemplation by parties who have recently purchased mines here.——Page & Co., who have purchased the Abe Erno mine in Quartz valley, are down 70 feet with their shaft, near bedrock. They have an 85-H. P. boiler for running the pumping machinery.

Trinity.

The La Grange property is four miles from Weaverville. The company owns 3000 acres of land there, with miles of ditches and pipes. Five giants are in use. A million of dollars have been spent in equipping the property. The season's cleanup is to be made soon.

Three successive dry seasons have affected the district. Cleanups are being made.

The McMurry & Hupp mine has yielded $17,000 for the season.

A new property is that of T. Bergin, which was sold within the last week for $35,000. It is located at the junction of Dutch creek and Trinity river, seventeen miles below Weaverville. The new owners are making improvements, including fifteen miles of ditches, the preliminary surveys for which are being made.

At Trinity Center the Bloss & McClary mine is running to its full capacity.

Tuolumne.

Sonora *Union-Democrat*: The Stanislaus Dredging Co., of which W. M. Stover is Pres., will put in a dredger near Robinson's Ferry. It will be 80 feet long, 40 feet wide, and draw 14 inches of water, permitting its operation during the period of low water. Bedrock is to be reached by a caisson 14 feet square, which will be sunk by its own weight, when the water will be forced out by compressed air and the space within the caisson cleaned up, and so on. The dirt is to be hoisted to the boat by means of a 12-inch centrifugal pump and turned into a double line of sluices, each making the circuit of one end and both sides of the craft, an aggregate length of 400 feet. An electric plant is to be installed.——The Atlas mine, an extension of the Bown, near Jackass hill, which has been lying idle for six months, will resume work the coming week, orders to that effect and $25,000 having been received from Scotland. The 500-foot tunnel from Soldiers' gulch will be driven to the old Atlas mine, 4500 feet farther. Mr. Barnar is Supt.——At the Confidence mine, at Confidence, ore is being mined on the 800 level. The force is small, owing to a limited supply of water, and the mill is hung up.——Drifting for the east vein in the Bown continues from the 300 and 400 levels. A shipment of concentrates to Selby has been made.——Pumping the water out of the Belle mine continues.——The Street mine at Tuttletown resumed operations last Monday, with G. Bower as Supt. For the present a day shift will be employed and work confined to sinking in the main shaft.

Sonora *Independent*: The Draper mine, near Soulsbyville, from a new discovery in the old workings, has shipped four tons of ore to Selby at San Francisco. This is the first time in thirty years that the mine has produced any ore of consequence. The mine is now in the hands of the Boston G. M. Co., G. F. Dyer Supt. This company secured the property last April, and since that time has been placing the workings in condition. The shaft is 300 feet deep and will be sunk an additional 300 feet. A 10-stamp mill will also be built. The Draper ore is high grade.

Jamestown *Magnet*: The Harvard M. Co., at their mines on Whisky Hill, near Jamestown, have erected a boarding and two bunk houses. Commencing July 1st, this company will board its employes. Supt. Munger is grading for a 60-stamp mill. The site selected for the mill is on Woods creek, east of the old mill.

COLORADO.

Pres. W. N. Byers of the State Board of Arbitration says that everything is favorable

for a settlement of the differences between the Smelter Trust and its employes. President Nash of the Smelter Trust is expected in Denver, and it is believed he will give Mr. Grant authority to conclude the negotiations now under way.

For the twelve months ending June 30th, '99, the gold received and paid for at the Denver Mint was $21,144,247, as against $16,240,441.93 for the year ending June 30th, '98. About 97% of the bullion received at the Mint is credited to Colorado mines.

BOULDER COUNTY.

The Nancy M. & M. Co., at Wall Street, has installed a three-drill air compressor and a 50 H. P. boiler and engine. The tunnel is in 190 feet and is to be run 700 feet farther to intersect the Gillard vein. The shaft on the Gillard will be sunk 400 feet to intersect the tunnel. A steam hoist has been installed on the Gillard.

CLEAR CREEK COUNTY.

Denver *Republican*: Anderson & Co., working the Jenny Lind mine, in Hukill gulch, have opened 7 feet of pay ore, which was found near the junction of two lodes in the adit level.——Philadelphia parties have taken a lease and bond on the Bullion claim for $10,000. A shaft will be sunk at the mouth of the adit level and machinery installed as soon as the shaft has reached sufficient depth.——The Marshall property at Empire is to be worked under the leasing system. Sixty-five full patented claims are owned and several of the lodes have been cut by the tunnel. Mr. Marshall says five of the claims are being worked. Within sixty days he expects to be working twenty sets of leasers. Machinery is to be put in by one of the lessees who has a wide streak of ore on one of the claims. The owner will put in a compressor and drive the tunnel 2000 ahead feet.

GUNNISON COUNTY.

(Special Correspondence).—The Ashland M. Co. of Ohio City is developing a group of twenty-one patented claims, located between Jones and Dutch gulches. The property has over 1000 feet of development—most of it done in prospecting, near the surface. Thirty-one veins have been opened. The result of this work being satisfactory, the company has begun a crosscut tunnel to cut the veins at depth. This tunnel is in 135 feet, and at 130 feet cut a blind lode 5 feet wide which looks well. The company is drifting on this vein for an ore shoot and at the same time driving the main tunnel ahead, the first of which will be reached in 50 feet. The crosscut gains 600 feet vertical depth in the first 500 feet of length. The veins pitch toward the mouth of the tunnel.

Among the mines surrounding the Ashland group, the Chloride recently shipped three cars of ore averaging $150 per ton and another shipment is being taken out. This property was purchased last fall for $25,000 and is credited with paying the purchase price, running expenses and a dividend since that time. The mine employs fifteen men.

The Granite Mountain is working six men and getting out a little ore. The manager expects soon to strike the main shoot.

The Calumet ships a car of high-grade ore occasionally and the mine is improving.

Two years ago the Little Jessie shipped two cars of ore, netting $2500, and has since suffered from litigation. The trouble has been settled, and work on this mine is now progressing on a 12-inch streak of $200 ore.

The Raymond mine employs fourteen men and is producing some rich ore. The values have improved from the surface to the present depth, 200 feet, and the manager states that the ore is becoming richer and more abundant. The Raymond Co. intend to drive a crosscut parallel and 3000 feet north of the Ashland Co.'s main tunnel. In 1000 feet the crosscut will open the Raymond vein at a vertical depth of 800 feet.

The Cortland has considerable ore on the dump ready for shipment.

The Sacramento and Volunteer, the two best developed mines in the camp, are idle. According to the statements of former managers, they have produced about $1,000,000 each, and, it is reported, they are still in ore. Reasons given for the shut-down are various. It is reported that the Sacramento is to start up again.

The Treasury, Little Dora and a number of other claims are working small forces, and the prospect for considerable development work in the camp this year is good.

The Mono cyanide mill is running steadily on the tailings from the Baker mill and is reported to be getting from $5 to $15 per ton from them.

The formation up here is mainly gneiss, granite and schist, cut by porphyry dykes. There is some hornblende, diorite and, according to the experts, trachyte. The ores are quartz, with iron oxide near the surface, and copper and iron sulphides with depth. The veins are fissures and contacts, mostly the former. Good roads, timber and water are abundant.

Ohio City, July 1st, '99.

The pumps at the Black-Queen mine, Crystal district, have started and development will be commenced when the mine is unwatered.

The machinery for the Cramer concentrator has arrived at Scofield and the mill will be ready to treat ores by July 10.

La Plata mine in Paradise gulch, Crystal district, will make its first shipment this week. A large amount of good ore is on the dump.

PITKIN COUNTY.

The people of Aspen have formed the Aspen Home M. Co., with a capital stock of $250,000, to develop a number of properties in the vicinity of Aspen.

LAKE COUNTY.

The Sedalia mine at Leadville is again in the hands of the owners, O. C. Bartholomew and Mr. Pickering. The mine was developed by W. H. Yankee, who sunk a shaft and took out considerable ore. The mine was examined and accepted by a son of Senator Clark of Montana last fall, and the money for the first payment deposited in bank, but a disagreement arose and defeated the deal. Arrangements are making to resume operations.

SAN JUAN COUNTY.

The 450-foot crosscut tunnel on the Jordan mine has been completed, and has cut a 10-inch streak of solid gray copper and lead that yields a good value.

SAN MIGUEL COUNTY.

Denver *Republican*: The Caribbeau mine and mill of Ophir has resumed operations after a suspension of two weeks. Seventy men are employed in mine and mill.——The operators of the Keystone placer have reached bedrock at a depth of 40 feet, and are putting in an elevator. The company has a gravel deposit 40 feet thick, 300 wide and 2 miles long. The elevator will handle 2500 cubic yards daily. ——The Mayflower, one of the big producers of Bridal Veil basin, will resume operations next week.——The erection of the Gertrude mill at Ophir will be commenced this week. ——The Tom Boy mine at Telluride is working 200 men in mill and mine and taking out 200 tons free milling ore daily. The mine has storage facilities for concentrates produced during a run of seven or eight months, while the gold saved on the plates pays the expenses of operation.

IDAHO.

The Mammoth mine at Wallace has resumed work with a force of twenty-five men.

Spokesman-Review: R. M. Sherman of Spokane has commenced work on the Hobson's Choice with a small force. The claim is an extension of the San Francisco.——Rigley & McKinney, part owners of the Big Buffalo, are still shovelling snow from the open cuts on the Merrimac, to have the surface ready for the experts who are expected.——The Crackerjack is cutting the lead, and is looking well. The owners will commence drifting as soon as the crosscut is finished.——The St. Paul is working a force of men, but nothing concerning the development has been made public. ——The snow is disappearing slowly and old stakings are beginning to show up. Of the new locations made since February it is now impossible to read some of them from the ground. On a tree which stands on the lee side of the brow of a hill there is a notice, now 20 feet above the snow, which is still 10 feet deep about the tree.——The Big Buffalo Syndicate has a United States deputy surveyor at work on Lake creek surveying placer ground, and has its ditch for the work nearly completed. The work is under the supervision of W. H. Hill, the company's engineer.——F. Brown has men at work on his placer ground, the Truesdale, on Deer creek, running a ditch. They are shovelling through 4 feet of snow.

NEVADA.

Pumping operations on the Comstock continue and are making material progress since the repairs to elevator No. 1 were completed. Mgr. Ross' latest official telegram is as follows:

"VIRGINIA, Nev., July 6th, '99.

"*To Alg. Waterman, Secretary Comstock Pumping Association, San Francisco*: No. 1 elevator is working continuously. The water is down 191 feet 1 inch below the 1750-foot level and stands 3 feet 11 inches on the 1950-foot station level. G. McM. ROSS."

NEW MEXICO.

Santa Fe *New Mexican*: R. A. Bradley has made mineral discoveries at Bradley's camp, four miles from Glorieta. It is low-grade ore with many pay streaks, and near the railroad, with water and timber plentiful. Thirty claims have been staked out by Minnesota parties. Mr. Bradley has staked off fifteen claims, on which he has done development. On one prospect there is a 200-foot and a 100-foot shaft, with 235 feet of tunnel and other development. This lead is 25 feet wide and has a granite foot wall and a lime hanging wall. Twelve claims have been staked on this lead. It contains gold, silver and copper. Another lead is 30 feet wide and has four claims staked on it. There are several other large and well-defined veins. Galena and lead ores, as well as magnetic iron ore, are found around Glorieta. Some of the iron ore carries gold and silver. There is also lime and coal at the camp. Mr. Bradley has erected a steam hoist. He has worked at Glorieta for eighteen years.

OREGON.

A new tramway is to be built at the Union-Companion mine at Cornucopia, by A. Sanders of Silverton, Colo.

Jacksonville *Times*: Lund Bros., who are developing the cinnabar ledge in Beaver creek district, for the Siskiyou Quicksilver M. Co., have struck good ore.——J. Berham of Portland, who is interested in the cinnabar mines in Meadows precinct, has let a contract for running a tunnel.

SOUTH DAKOTA.

The Moore group of tin mines, seven miles west of Custer, which were recently purchased by E. C. Johnson, comprises the Dolphin, Tempest, Tornado and other locations. The veins vary from 4 to 20 feet in width, and in all the open cuts or shafts of 10 to 30 feet in depth tin stone or cassiterite shows up. There are also found veins of quartz which carry gold. It is said that these mines have been purchased with the intention of developing them and working them for the tin they contain.

UTAH.

(Special Correspondence).—Recent attacks of an Eastern paper on the Boston Con. Copper & Gold M. Co. and its Bingham, Utah, proposition have brought forth vigorous protests from many of the most capable mining men of the State, who consider the aspersions unjustified by facts. It is believed the unfavorable comments were made without an investigation of the property or an inquiry into results of developments, assays and mill tests.

Without seeking to become the champion of the Boston Con. or to pose as an authority to settle questions of economic metallurgy, I desire herein to record some of my observations as the result of a day's visit to the property in Bingham canyon. The company's holdings comprise 339 acres, extending from the Highland Boy grounds on the west to the DeLamar properties on the east. Adjoining them on the south and on the east are the Commercial group and that of the Old Jordan and Galena. On the north are the properties of F. B. Cook & Co. The Highland Boy and Boston Con. appear to end-line with each other, and the veins and ledges, so well developed on the former, are undoubtedly the same as those which are opened on the latter. The grounds of the Boston extend from Muddy gulch, a branch of Carr Fork, across a mountain spur, to Bingham canyon. On the Carr Fork side of the mountain is that portion of the property known as the Stewart group, whose surface workings have produced a great deal of oxidized gold-bearing ore. On this side are four tunnels—the Armstrong, Campbell, Phœnix and Bulldozer. The first-named is the lowest, and goes in 1000 feet, which crosscuts the main vein. The Campbell has been driven to a depth of 1300 feet, opening the same vein as that cut by the Armstrong. An upraise is being made to connect the two. The veins encountered by these two lower tunnels are contacts, having porphyry foot wall and lime hanging wall. Several hundred feet higher up the hill is the Bulldozer tunnel, in about 900 feet, which crosscuts several veins, and farther in it drifts on a vein which parallels the main vein of the Armstrong and Campbell tunnels. This tunnel is driven at a level where the oxydized and carbonate ores above appear to meet the sulphides below. Development here is such as to disclose ledges of solid ore from 20 to 50 feet in width. The oxidized material is rich in gold. The sulphides carry copper, gold, lead and silver. Still higher up the hill is the entrance to the Phœnix tunnel, driven to a depth of 400 feet, on the strike of the vein. Here there is in evidence the work of former lessees, where much stoping and some sinking has been done. On this level the ores are chiefly oxidized, wherein the gold values doubtless preponderate. The Phœnix vein is apparently the same as that found in the upper workings of the Highland Boy, which initiated the latter as a gold proposition and caused its cyanide mill to be built. All the veins in the four tunnels named, yielding sulphides in the lower and oxidized ores in the upper workings, are carried by an immense zone, trending eastward and westward, and approximately 2500 feet in width, the material being porphyry, limestone and quartzite.

In general, the ores of veins just described run from 4% to 16% copper, with gold values of considerable importance right through. The proposition presented by conditions on this side of the hill is very similar to that of the Highland Boy, and appears to have been as thoroughly tested as the latter, though it is doubtless true that Highland Boy ores carry higher values than do the ores from the Stewart group of the Boston Con.

But, climbing to the crest of the mountain spur and looking to the opposite side toward Bingham canyon, the company's remaining grounds spread out before you. About 700 feet above the bed of the canyon the Copper Center tunnel cuts into the mountain a distance of 1300 feet in a westerly direction toward the Stewart group, on the opposite side. About 1000 feet above the Copper Center the Jubilee tunnel penetrates to about 800 feet in the same direction. At various stations crosscut drifts are made from the main tunnels for the purpose of exploration. The entire workings disclose the fact that this side of the mountain comprises an immense mass of mineralized porphyry. There appears to be an absence of well defined veins, but simply a great zone, which thorough tests prove to be uniformly mineralized. Tests by concentration and assays extending, it is claimed, over a period of five months, showed a saving of about 80% of the values, which showed an average of 2.47% copper and 58 cents gold per ton. It is shown that the Markham concentration mill was leased for several months and was kept busy running this ore. In the tests made twenty-two tons of crude ore were concentrated into one ton and the values are attested to by the returns from the smelter which reduced the concentrates.

A question raised was whether copper ore of this grade can be mined, concentrated and smelted at a profit. The mining proposition, so far as this copper zone is concerned, is simply a question of stripping and quarrying; the concentration problem is one of facilities for handling a large tonnage of the ore in the vicinity of the mine; the smelting factor is a question of concentrating the ore down so that it will stand shipping and treatment charges. The matter of providing water for a large concentration mill will entail some expense, but this is not a serious problem. The only figures and calculations I have seen in the direction of settling the question above are those compiled by the Boston Con. Co., and their figures are evolved step by step from such thorough and apparently accurate tests that I think the mining public will not fail to properly discriminate between conclusions based upon tangible demonstration and those built upon presumption. WASCOTT.

Salt Lake City, June 26th, '99.

The Taylor & Brunton Sampling Co., since Jan. 1st, '99, have handled from Tintic district, 23,871 tons; Bingham, 4223 tons; other Utah camps, 4538 tons; total, 32,632 tons.

FOREIGN.

BRITISH COLUMBIA.

Frankie Florman, of Rapid City, S. D., has discovered a vein 200 to 600 feet in width and a mile long at Atlin City. Surface assays average $8.

Sandon *Review*: The Noonday mine near Silverton is being worked, the management paying $3.50 for eight hour shifts. The ore body contains 5 to 9 inches of concentrating ore and from 10 to 24 inches of solid galena. Gray copper has also been found.

Cascade *Record*: Underground work on the Golden Crown, in Wellington camp, has been stopped pending the installation of the 60 H. P. boiler and engine and the 5 drill compressor. The shaft will be continued to the 300 level.——D. Mann, who owns the North Star, near Fort Steele, and mines near Greenwood camp, including the Brooklyn, Stemwinder, Idaho and Rawhide, will organize a company, to be known as the Dominion Copper Co. to open and work these mines.——Since the 200 level was reached with the double compartment shaft on the Mother Lode, in Deadwood Camp, 600 feet of crosscuts have been run from the bottom of the shaft in four directions.

MEXICO.

The Copeta copper and gold mine in Sonora is reported sold to a New York syndicate for $3,000,000. The mine is owned by W. Melczer of Phœnix and J. J. Hardwick.

NEW ZEALAND.

The development of the Keep-it-Dark reef, discovered a few months since at Reefton, is progressing. The tunnel being driven from No. 3 level to intersect this lode is in 200 feet and will make available 400 feet of backs. The company is erecting a plant for the treatment of the tailings by the cyanide process, as the tests made have shown that gold is lost by the ordinary milling operations. The company paid dividends in the past amounting to £113,415.

SOUTH AFRICA.

Johannesburg *Mining Journal*: The first mile of 28-inch piping has arrived for the permanent main of the water scheme decided upon by the United controlling groups for the supply of water to the line of Main Reef. The scheme involves the lifting of the needful quantity of water to a storage reservoir on the Klipriviersberg range of hills, from which the water will distribute itself by gravitation. The remaining seven miles of this piping are being shipped. The pumping engine required to lift 9,000,000 gallons of water daily to the height of 900 feet is also being shipped.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

POSTAL BOX SIGNALS.—Francis C. Bates, San Jose, Cal. No. 627,635. Dated June 27, 1899. This invention relates to a device which is called a "postal box signal." It is especially designed for use in connection with boxes for receiving mail matter in rural districts, where the postmen have to traverse considerable distances, and where the boxes are frequently at some distance from the regular line of travel. It consists of one or more signals connected with the box and a means for displaying the signal by the act of introducing postal matter into the box, so that it can be seen from a distance whether there is anything in the box to be collected, and in the same manner a signal is displayed to indicate to those using the box whether any mail matter has been placed in the box for them by the carrier.

CULTIVATOR.—John A. Bliz, Pleasanton, Cal. No. 627,637. Dated June 27, 1899. This invention relates to improvements in cultivators of that class in which the cultivating teeth are attached to a frame having V-shaped or convergent sides. It consists in the employment of independent detachable boxes having sockets through which the standards of the cultivator teeth are vertically slidable and adjustable without being capable of turning from side to side. The faces of the boxes are inclined with reference to the sockets in which the standards move, so that when they are fixed to the inclined beams of the frame the standards and cultivator teeth will always remain in line parallel with the line of travel of the cultivator.

TRICYCLES FOR INVALIDS.—John C. Eames, San Francisco. No. 627,639. Dated June 27, 1899. This invention relates to improvements in tricycles of that class which are manumotive, or propelled by hand power. The frame consists of a rectangle formed of the front main axle, a rear bar is parallel therewith and has longitudinal connecting bars; a steering wheel socket with an inclined brace rod connects the rear bar of the frame with the base of the socket, and tubular vertical seat-supporting posts extend upwardly from opposite sides of the center of the axle. A rear bar and upwardly converging bracing bars connect at their lower ends with the front and rear bars of the frame, their upper ends uniting to form a support for the crank axle journal boxes, with independent crank axles mounted in said boxes and power connections between the crank axles and the front axle.

BED LOUNGES.—Charles H. Mullen, San Francisco. No. 627,657. Dated June 27, 1899. This invention relates to certain improvements in that class of furniture known as bed lounges, and it consists of a seat and back flexibly hinged together, automatically foldable legs having opposite ends in the plane of the movement of the back and intermediate portions turned at right angles to said ends, and means connecting said intermediate portions, said legs connected with the seat and the back and extensible to support the back in its horizontal position. A containing box forms a base and support for said superstructure, with hinges connecting the rear of the seat with the coincident edge of the box, and hinged connecting links by which the movement is limited.

List of U. S. Patents for Pacific Coast Inventors.

Like a Home in Oakland?

A nice home for your family in a choice part of Oakland. Good schools and churches. Forty minutes from San Francisco. Climate perfect. A cosy cottage built with special view to convenience for the owner's own use. Five large rooms and large, well-lighted attic and servant's room. Good laundry separate from house. Large grounds and fruit trees. Price $3500, or to rent for $25. Three adjoining lots very cheap. Easy terms. This is a very sunny, cheerful place. Address A. L. T., this office, or call at 1601 8th Ave., East Oakland.

Mining and Mechanical Engineer of twenty years' experience desires engagement, for family reasons, in locality below an altitude of 6500 feet. Mining and concentration a specialty. Address "Concentrator," care Mining and Scientific Press.

Mining Superintendent, Assayer and Millman

of twenty years' experience wishes position. Eight years at last place. Best of reference. Address A. J., care Mining and Scientific Press.

MINING ENGINEER,

with eighteen years' practical experience in all branches of mining work, wants position as superintendent, assayer, surveyor or bookkeeper. Address "Cupel," care Mining and Scientific Press.

AN ACCOUNTANT

Of seven years' experience with mining company desires a position in any country. Good references. Address C G., this office.

MACHINERY — FOR SALE OR LEASE, all or half interest in the Cripple Creek Machine Shops and Foundry. This is the largest and best equipped plant in the district; or will trade for good mining property or stocks in the Cripple Creek district. Party must be practical and competent to take charge of and manage the business, as owner is giving his attention to mining. Address the Cripple Creek Machine Shops, Cripple Creek, Colorado.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery. For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

..CRIPPLE : CREEK..
FOR SALE—CYANIDE PLANT,

100 tons daily capacity; in first-class condition to handle Cripple Creek ores.

Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

The "Stop for Repairs" to Mining Machinery,

Especially if it is a conveying plant, is a considerable item of expense. Many of these expensive pauses are made to repair or adjust faulty belting. To economize in this respect, use the

LEVIATHAN CONVEYOR BELT.

It is not only adapted to the heaviest service, but will run under any conditions in underground, drippings, extreme heat or cold.

IT WILL OUTLIVE ANY OTHER BELTING.

MAIN BELTING COMPANY,

THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

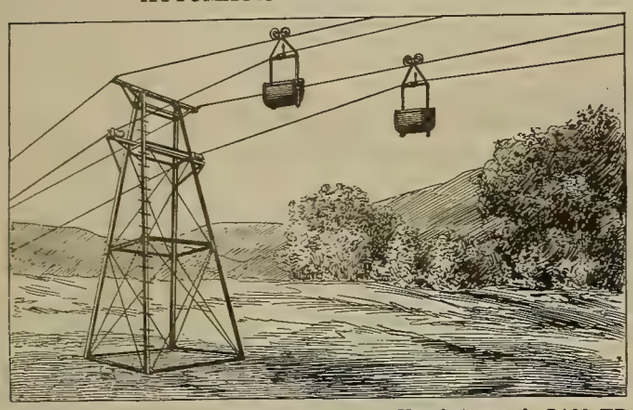
Dewey, Strong & Co., Patent Agents,



330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : :

Thoroughly Protected by Strong Patents. Write for Circular.

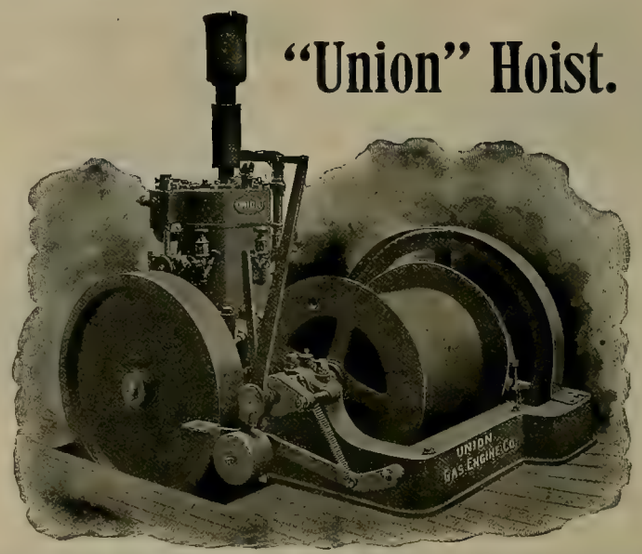
Chicago, Ill., U. S. A. London, England.

Mining Machinery.

Stamp Mills, Smelting Furnaces,
Rock Crushers, Huntington Mills,
Hoists, Rolls.



Exclusive Makers of RIEDLER PUMPS AND AIR COMPRESSORS.

PERFORATED SCREENS A SPECIALTY. Samples sent on request.

When in need of any Mining or Metallurgical Machinery BE SURE AND GET OUR FIGURES. "WE LIKE TO MAKE ESTIMATES," and will give your inquiries careful attention.

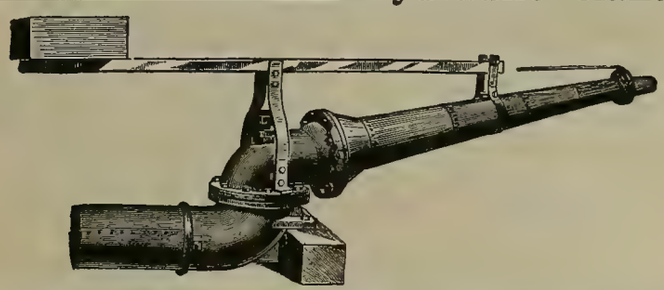
GENERAL AGENCY FOR GREEN BLOWERS. FRASER & CHALMERS.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

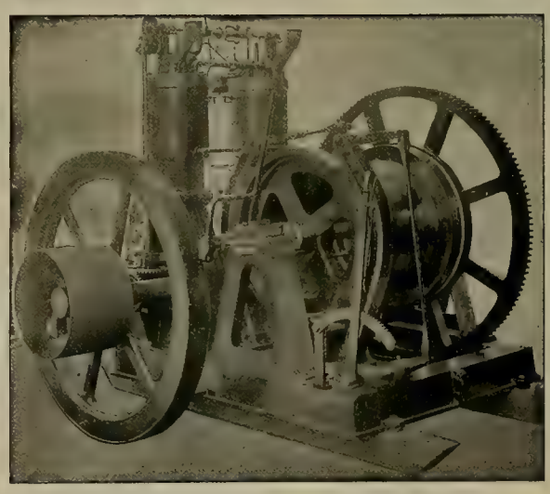
—BUILD THE—



"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.



Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

Double-Jointed Ball-Bearing Hydraulic Giants.

The above presents an improved **Double-Jointed Ball-Bearing Hydraulic Giant** which we build. The improvement consists of the introduction of a **Ball Bearing** by which the pressure of the water is reduced to a minimum and the direction of the nozzle changed at will with ease.
Catalogues and prices of our specialties of HYDRAULIC MINING MACHINERY furnished upon application. **JOSHUA HENDY MACHINE WORKS, 38 to 44 Fremont St., San Francisco. Cal.**

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 1st day of July, 1899, and the day of sale from the 8th day of July, 1899, to SATURDAY, the 22nd day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to TUESDAY, the 1st day of August, 1899, and the day of sale from the 22nd day of July, 1899, to SATURDAY, the 19th day of August, 1899, at the hour of 2:30 P. M.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 3) has been postponed to TUESDAY, the 1st day of August, 1899, and the day of sale from the 22nd day of July, 1899, to SATURDAY, the 19th day of August, 1899, at the hour of 2 P. M.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

DELINQUENT SALE NOTICE.

THE MARGUERITE GOLD MINING AND MILLing Company.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 13) levied on the 9th day of May, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Marcus Schwab	64	500	$50 00
Kath. Emhoff	93	500	50 00
H. Helfrich	166	250	25 00
Mrs. M. L. Faas	209	5	50
Peter Kruckel	232	62½	6 25
J. Beck	233	62½	6 25
Andreas Kruckel	251	100	10 00
John C. Lutz	265	200	20 00
Chas. Riegert	274	100	10 00
H. Helfrich	295	100	10 00
John C. Lutz	318	100	10 00
John C. Lutz	335	100	10 00
Adam Miller	350	125	12 50
C. Kayser	360	25	2 50

And in accordance with law, and an order from the Board of Directors, made on the 9th day of May, 1899, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the company's office, 237 Twelfth St., San Francisco, California, on MONDAY, the 10th day of July, 1899, at the hour of 5 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

F. METTMANN, Secretary.

Office—237 Twelfth St., San Francisco, California.

DELINQUENT SALE NOTICE.

ARRASTRAVILLE MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 16th day of May, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
A. E. Sayre	627	4,400	$440 00

And in accordance with law, and an order from the Board of Directors, made on the 16th day of May, 1899, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, 213 Jackson St., San Francisco, California, on TUESDAY, the 11th day of July, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. MIDDLETON, Secretary.

Tenders for Placer Mining Claims on Dominion Creek, in the Yukon Territory.

SEALED Tenders addressed to the undersigned and marked on the envelope "Tender for a placer mining claim" will be received at this Department until noon on Friday, the 1st day of September, 1899, for placer claims and fractions of claims on Dominion Creek reserved for the Crown.

The following is a list of the numbers of the claims and fractions and the approximate frontage thereof as surveyed by Messrs. James Gibson and R. W. Cautley, Dominion Land Surveyors:

BELOW UPPER DISCOVERY.

No.	Length in ft.	No.	Length in ft.
1A	5	10A	33.3
2A	19	15A	42.25
3A	30.5	31A	43
8A	87.4		

ABOVE LOWER DISCOVERY.

No.	Length in ft.	No.	Length in ft.
1A	12	6A	85.00
2A	59.1	10A	143.25
4A	1.25		

BELOW LOWER DISCOVERY.

No.	Length in ft.	No.	Length in ft.
1A	56.3	75A	24.7
2A	7.2	76	500.
2C	20.3	77	449.8
8A	34.00	16C	333.8
9A	39.25	18A	164.7
11A	98.4	78A	3.6
13A	68.5	80	451.3
16A	40.25	81A	15.3
20	202.1	83	500.
21A	71.9	84	500.
22	500.	85	500.
22A	60.7	86	500.
23	446.2	87	500.
25	500.	87A	500.
26	120.66	87B	387.9
31	350.5	89A	35.1
33	500.	91	500.
34	500.	92	500.
36	500.	93	500.
37	500.	94	500.
38	352.	95	500.
68A	94.7	96	500.
69A	40.5	97	500.
70A	72.6	98	500.
71	414.4	99	500.
73A	12.3	100	478.7
74A	21.3	101	119.

Each tender shall specify the numbers of the claims and fractions tendered for and also the amount of bonus offered for each claim and fraction. The tender may be for the whole lot or any one or more of the claims and fractions and must be accompanied by an accepted cheque in favour of the Minister of the Interior for ten per cent of the amount offered, one-half of the remainder to be paid into the Department of the Interior at Ottawa or to the Commissioner of the Yukon Territory at Dawson within thirty days from notice of acceptance of tender, and the balance within six months thereafter with interest at the rate of four per cent per annum.

Entries for the claims and fractions will be granted in accordance with the Placer Mining Regulations on acceptance of tender.

The entries will be subject to the usual royalty and the provisions of the said Regulations from time to time in force, except as to representation provided for by Clause 39, which will not be required.

The claims and fractional claims for which entries may be granted shall not include any portion of the bench or hill claims for which entry may have been previously granted.

The highest or any tender not necessarily accepted.

JOHN R. HALL, Secretary.

Department of the Interior,
Ottawa, 27th May, 1899.

PROPOSALS ARE INVITED FOR THE CONstruction of a pumping plant and pipe line at Minas Prietas, Sonora, Mexico. Length of line, about 16¼ miles; delivery 275 feet higher than intake; capacity 300,000 gallons per 24 hours, with margin to allow of increase to 600,000 if required; pumping plant of sufficient power to do work required with most economical use of steam, and pipe of suitable strength to allow a safe margin over pressure it may be called upon to stand. Contract for material and installation will be let as a whole, or separate contracts will be made for furnishing material and installation, as the company may determine. For further information, profile of line, etc., address W. T. BARRETT, Minas Prietas Water Co., Torres, Sonora, Mex.

Stockholders' Meeting.

Notice of Stockholders' Meeting of the Union Hill Consolidated Mines.—In accordance with a resolution passed by the Board of Directors of the Union Hill Consolidated mines, a meeting of the stockholders of this company will be held at 11 o'clock in the forenoon on WEDNESDAY, the 12th day of July, 1899, at its principal office, 320 Sansome street, room 24, San Francisco, California, to consider and vote upon a proposition to increase the capital stock of this company to Two Hundred Thousand ($200,000.00) Dollars in 200,000 shares at the par value of One Dollar each.

Dated: San Francisco, May 25th, 1899.

JOSEPH H. MOOSER, Secretary.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

MINING AND CIVIL ENGINEERING DEPARTMENT: Mathematics, Draughting, Strength of Material, Chemistry, Assaying, Blow-Pipe Analysis, Geology, Mineralogy, Surveying, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation.

ELECTRICAL DEPARTMENT: Theory and Practice; Construction.

BUSINESS: Bookkeeping, Shorthand, Typing, Modern Languages, etc.

Twenty teachers; individual instruction; can enter at any time; Catalogue and Journal free.

Mining and Metallurgy.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POSTPAID. Following is a partial list:

ASSAYING:—PART I—GOLD AND SILVER ORES.
Third edition; Rewritten and Improved by the Author, C. H. Aaron; 130 pages, illustrated....$1

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. Well illustrated. Cloth.....$2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. M. C. Ihlseng. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated..... ...$5

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall.....$2

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, etc.....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall.....$2

SKELETON MINING REPORT:
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....50c

PROSPECTOR'S FIELD BOOK AND GUIDE:
4th edition, just out. By H. S. Osborn.....$1 50

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus.....$3

MINERALOGY:
Brush & Penfield, revised edition, $4; Dana, 6th edition, $12 50; Dana, for beginners, $1 50; Dana, Mineralogy and Petrography, 12th edition.....$2

GEOLOGY:
Emmons, $1 50; Le Conte, revised edition, $4; Dana, 4th edition.....$5

IRON AND STEEL:
Thurston, 6th edition.....$3 50

LITHOLOGY:
Williams, 2nd edition.....$3

HYDRAULIC GOLD MINING:
Kirkpatrick.....$1

LIEBER'S CODE:
Bound in leather.....$3

METALLURGY:
Eggleston, Silver, Gold and Mercury, 2 vols.$15

TUNNELING:
Blasting, Timbering, Air Drilling, etc.; 100 illustrations; Drinker, 3rd edition.....$25

ALLOYS:
Thurston, 2nd edition.....$2 50

ASSAYING:
Furman, 4th edition.....$3

CHLORINATION PROCESS:
E. B. Wilson.....$1 50

HYDRAULIC AND PLACER MINING:
E. B. Wilson.....$2

HIGH EXPLOSIVES:
Eissler.....$4

GOLD ORES:
Treatment of; O'Driscoll.....$2

MINERALS:
"How to Study Them," Dana, 2nd edition, $1 50; Dana, American locality of mineral, 6th edition.....$1

MANUFACTURERS OF

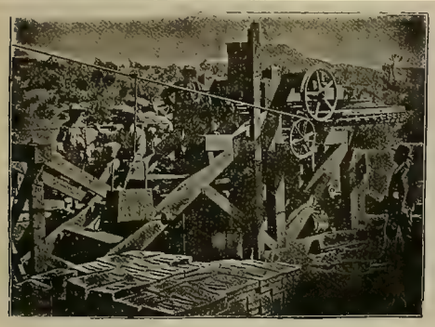
Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.



Send for Dredging Catalogues Nos. 15 and 16.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

THE CALHOUN EXCAVATOR. A COMBINED POWER-SHOVEL AND CABLEWAY. .....Ask for Circular.....

Cableways, Double Rope Tramways, Wire Rope Transmissions, Incline Planes, Logging Machinery, Suspension Bridges,

Pioneering in British Columbia.

Throughout the West the men who discover and open to the world new mining regions have many obstacles to overcome and privations and hardships to endure which are unknown to those who have never left their comfortable homes to pioneer in a wilderness of timbered and rugged mountains or labor wearily across a waste of burning sands. There are none of the conveniences of civilization, but the pioneer must be fruitful of resource, and, as the history of the West shows, he usually finds a way to overcome these difficulties.

Three of the illustrations on this page convey a very good idea of how a pack

Kootenay, is an important stream flowing into the Columbia near Galena P. O. The trail to the mines on this creek starts from the Columbia at a point opposite Spillmachene landing, to reach which from the Golden and Fort Steele wagon road, it is necessary to swim the horses across the Columbia as illustrated herewith. The creek is twenty-eight miles long. The camp of tents shown is at the head of Bugaboo creek near the Twenty-One and Western Cross mines. The formation in which the veins occur is slate, cut by veins of quartz carrying sulphides of iron and lead containing gold and silver and are high grade. The veins are not large and the amount of development does

SWIMMING PACK TRAIN ACROSS COLUMBIA RIVER, B. C.

train is transferred across a deep, swift river. The scene is in British Columbia and is taken, together with the other illustrations on this page, from the last report of the Minister of Mines for that province. Here the pioneer miners, finding it necessary to cross the stream and having no bridge or suitable vessel for transportation, drive their horses into the stream and make them swim to the opposite shore. The beautifully picturesque scenery is illustrated in each of these pictures. Bugaboo creek, in East Kootenay, is an important stream flowing into the Columbia near Galena P. O. The trail to the mines on this creek starts from the Columbia at a point opposite Spillmachene landing, to reach which from the Golden and Fort Steele wagon road, it is necessary to swim the horses across the Columbia as illustrated herewith. The creek is twenty-eight miles long. The camp of tents shown is at the head of Bugaboo creek near the Twenty-One and Western Cross mines. The formation in which the veins occur is slate, cut by veins of quartz carrying sulphides of iron and lead containing gold and silver and are high grade. The veins are not large and the amount of development does not entitle them to particular prominence at this time, but they are interesting and in a country of wild scenic grandeur. The altitude at the head of the creek is 7650 feet, above which rises the neighboring ranges and peaks to a much greater height.

Industrial Notes; Personal; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Obituary; Catalogues Received, 95. Recent Mining Incorporations; Recent California Dividends, 99.

THE continued high price of iron and steel is being felt in the industrial world in the rise in price of machinery. In some cases large Eastern manufacturers of heavy machinery for mining purposes are reported refusing to contract to deliver large orders at a specified time, owing to the uncertainty of being able to obtain the necessary raw material. Some of the large copper mining companies on Lake Superior, it is said, being desirous of increasing their output, are unable to get the necessary stamping and other machinery.

IT has been unanimously decided by the Supreme Court of Colorado that the eight-hour law is unconstitutional. The law passed by the last Colorado Legislature applied only to mines, smelters and mills for the reduction of ores. The effect upon the most important industry of Colorado when the law went into effect is known—nearly every smelter in the State closed down, for the reason that the American Smelting & Refining Co. refused to pay the same wages for eight hours that had previously been paid for ten and twelve hours' work. Although the courts have declared the law unconstitutional, there is no disposition on the part of the workmen to work a longer time than eight hours and they demand that the union be recognized. Negotiations between smelter managers and workmen are still in progress.

ALTHOUGH it is now over twenty years since the Leadville district was discovered to be a region of lode mines, and it has since been explored and exploited extensively, it is almost a weekly if not a daily event to learn of a new strike of valuable ore. At first attention was almost wholly directed to the oxidized ores—carbonate of lead and iron oxides. Later the sulphide ores commenced to appear and many predicted the beginning of the end, but the industry has continued steadily though its pathway has been strewn by many obstacles, among them vast volumes of water, long rigorous winters, labor troubles, scarcity of timber for mining purposes, etc., but still it has advanced. In the early years little attention was given to gold mining, which may be considered strange, as twenty years before the camp became famous for its lead-silver ores, millions of dollars in gold were taken from the rich placers of California, Iowa and tributary gulches. It is now known that the source of this gold was the eruptive rocks back of the city on the western slope of the Mosquito range. One of the first mines of this class to attract attention was the Antioch, which produced a large amount of gold, still this did not direct attention to the possibilities of the gold belt. They are now more fully realized and active work is being carried on with a view to thoroughly opening the mines of this class. In the lead-silver region new finds are of very frequent occurrence, and it is still safe to predict new discoveries in this district which are not anticipated by the miners.

The Phantom Millions of Alaska.

With the arrival of each steamer from Alaskan ports comes the announcement that there are hundreds of thousands of dollars on board, and usually connected therewith are the names of half a dozen adventurers who are presumed to own the gold. If the various amounts already reported as having arrived are considered in the aggregate they will soon reach several millions of dollars over the amount which has actually come from the north. Very little is said of those who come back without a dollar, having wasted two or more years in that frozen zone to no purpose, and no mention at all is made of the thousands already there struggling to earn enough money to procure the bare necessities of life, and who would leave the country only too gladly if opportunity afforded. The thousands of men who frantically surge from one point to another in the North upon the announcement of a new rich strike are not those who do own good claims as a rule, but those poor unfortunates who have little or nothing beyond the means of reaching some new locality where there is the faintest hope of recovering their losses. They are like drowning men who grasp eagerly at straws. When the history of the Arctic gold fields is truthfully written it will contain little of romance and much of hardship, privation and suffering.

Miners and others now returning from Alaska bring reports which confirm the finding of gold on Snake river and its tributaries in the Cape Nome district. Some very extravagant stories are told, among them one to the effect that, owing to the frozen condition of the ground, the deepest workings were but 3 feet deep, and from this $10,000 was taken. The ground worked covered an area of 25x1000 feet. Six men were employed fifteen days, and a good portion of the ground was carried 50 feet to the sluice boxes. These men must have been heroic workers to have removed nearly 2800 yards of gravel, partly frozen, and carry it 50 feet to a sluice box in fifteen days. This case is analyzed to show how far such statements depart from the truth. It may be added that all such statements are made by those who have a direct interest in promoting immigration to Alaska.

EVER alive to the importance of the mining industry and mindful of the business that mining activity causes, all the railroad companies—except the principal one in California—constantly issue handsome pamphlets, finely illustrated, and replete with up-to-date information concerning the development of the mineral resources of the regions traversed by their lines. The latest to hand is from the Rio Grande Western Railway, a good advertisement for Utah and the mineral wealth of that great State. Like Colorado, Utah understands the value of advertising; it realizes that the mere possession of mineral wealth is not of much material value to those now on earth unless people are told about it; hence the newspapers and railroad companies vie with each other in proclaiming to the would-be investor the possibilities for profitable placing of capital. This is an advertising age; the concern or commonwealth that does not advertise is sure to fall so far behind that it fails to keep step with the music at the head of the procession. In announcing the possession of mineral resources and pointing out the honest profit in their legitimate development, the railroads do the State a service, and such enterprise is commendable.

ALREADY in several counties of California the shortage of water is being felt in the conduct of mining operations. For fifty years the mines of California have been worked actively, and yet no concentrated effort has been made by those most interested—the miners themselves—to provide sufficient water to last through a single season. During the dryest years an abundance of water flows to waste in the earlier months down almost every canyon heading in the Sierras. A few weeks later the streams diminish rapidly and by early fall the beds of the streams are practically dry as far as their utility for mining goes. Those who are far-sighted enough make contracts with water companies for a continuous supply, and others, less providential, are obliged to run on short allowance or shut down altogether. The natural supposition would be that after years of such experience the miners would formulate some plan by which water might be stored in sufficient quantity to insure a supply throughout the dry season, but no concerted effort in that direction has yet been made.

A NEW-PROCESS MAN, Mr. Geo. S. Engle, is in the field with a new idea which, as usual, will revolutionize mining and metallurgy. In his modest little folder the inventor says, with his process he saves the cost of a concentrator, does away with the expense of buying silica and other fluxing material, and also saves the cost of a roaster. He works his process with eight or twelve men where plants of similar capacity operated by any other known process would require 150 men. He places the cost of a 400-ton concentrating plant and a smelting works at $600,000 where by his process the plant can be built at the mine, saving freight, cost of hauling ore, etc., and ship from the plant "mat" worth several thousands of dollars per ton. He can erect his plant complete with a capacity of 400 tons daily at a cost of about $5000, and can treat the ore for from $1.00 to $1.50 per ton. That this latest of patent-process men has arrived at a most opportune moment no one will doubt. He is the kind of fellow the owner of low-grade mines has long been looking for, but it is almost unnecessary to say that Mr. Geo. S. Engle and his process cannot endure in this age.

LONDON appears to be in unusually good luck in securing most of the "big things" in new mining ventures nowadays. The latest is the Ray Copper Mines, Limited, of Pinal county, Arizona. These mines were formerly known as the Taylor, Ray and Innes groups, and are situated in the Mineral creek country. They were sold by the owners to the Globe Minerals Exploration Co. of London, it is reported, for $150,000. The Ray Copper Mines, Limited, is an outgrowth of this transaction and is floated on a basis of £260,000 in 260,000 ordinary shares, of which 145,000 have been issued, presumably to the control. The property comprises fifty-two claims and the company's expert reports 190,000 tons of ore in sight, worth anywhere from $665,000 up, net. While it is legitimate to purchase a mine for $150,000 and float it for a larger sum, if this figure is all the mines were worth it seems that a sum approaching nearly ten times that amount is somewhat extravagant, particularly in an English market, where capitalization is rather more important than in America.

FROM New Mexico, in the Jarilla mountains, northeast of El Paso, comes a tale of wonderful richness. The press dispatches describe a land destitute of water, teeming with poisonous reptiles and insects common to the desert; where no comfort exists, where every plant bears a thorn, and where only hardship and misery can be the lot of those who venture there, but where gold may be had without mining, simply for picking it up from the surface or knocking chunks off of the outcropping ledges, which is not an easy task, as the rocks "are matted together with metallic gold." Such fairy tales as this are sure to lure the uninitiated and hundreds will rush there. San Roque landing and Cerro Pintado, in Lower California, are a paradise to this new gold field in La Journada del Murte, as that desert in southern New Mexico is called, and its naming is significant—"the Journey of Death."

THE legal division of profits and property as the result of litigation has received fresh illustration in the case of the Golden Cross mine, San Diego county, Cal. Originally attached by men to whom was due money for supplies, machinery, etc., the case dragged on for years, with the customary outcome. Fifteen Los Angeles, Cal., attorneys get $188,000 in fees; nine San Francisco attorneys get $156,000; a San Diego, Cal., law firm gets $66,000. Then one other Los Angeles lawyer and two other San Francisco lawyers get securities said to be worth $400,000 more.

Concentrates.

CORUNDUM is not an aluminous silicate, as previously inadvertently stated, but an oxide of alumina.

ACCORDING to reports from El Dorado canyon, Nevada, the cyanide plant there saves 98% of the assay value.

"SAPROLITES" is a term used in the Dahlonega, Georgia, district, to designate decomposed bodies of ore in place.

THE value of the mineral output in Tasmania for the first quarter of the year was £45 4s 10d per man employed.

THE stockholders of the Homestake M. Co. voted in San Francisco to increase the capital stock from $12,500,000 to $21,000,000.

THE U. S. Government is paying $400 a ton for 2200 tons armor plate for the new battleships now building at San Francisco and elsewhere.

THE character of eruptions from the interior of the earth has varied at different geological ages. Those of late Tertiary and recent time have been almost exclusively of a basic type, and include andesites and basalt.

INJECTORS are in common use on steam boilers, and are considered economical. One of recent build will take steam from one boiler at 75 pounds pressure and deliver water into another boiler carrying 225 pounds of steam.

A GOOD aneroid barometer may be used to measure the depth of a shaft if a number of trips are made and the average taken. These trips should be made without delay, that is, without stopping at intermediate points.

THE ridiculous assertion that "four tons of virgin gold from the Klondike will be exhibited at the Paris Exposition in 1900" is simply a newspaper story. If the man who wrote it repeats it two or three times he will begin to believe it himself.

LONG crosscuts through hard ground to reach a vein at great depth, which has only superficial work at the surface, are not advisable, no matter how rich the vein may be on top. Prove first that the vein has sufficient value and depth to justify the crosscut.

WIRE ROPES, ordinarily known as plow-steel ropes, are of high tensile strength, and made of high-grade crucible steel, which in the form of wire will bear a strain of 100 to 150 tons per square inch of section. Large drums and sheaves are advisable on all kinds of wire ropes.

BORAX minerals where found in place, that is, in the form of a vein as that in the east Calico, Cal., mines, may be located the same as lode claims, but where they occur in the basins of dry lakes, etc., they should be located as placers. Deposits of salt are located in the same manner.

TO RAISE 1000 gallons of water (111 miners' inches) per minute to a height of 80 feet, would require a 40 H. P. engine. With a 4-inch pipe, a velocity of 18 inches per second, a friction head of .96 inch, there would be a friction loss of .04 lbs. per square inch, figuring on each 100 feet in length.

UNDERHAND stoping is not commonly followed but is sometimes employed to get ore without the expense of drifting to an ore shoot from a main shaft. It is sometimes used in working small veins of rich ore. It requires more timber where followed extensively than overhand stoping and the timber cannot be recovered.

THE idea that when volcanoes are active they discharge, along with cinders, rocks, mud and water, large quantities of gold, which, falling back to earth, is washed into the streams and found as placer gold, is absurd, and one of the strongest proofs against it is that basaltic and other volcanic lavas do not contain gold.

ROCKS in the presence of moisture under great pressure melt at a lower temperature than where dry and exposed to ordinary atmospheric pressure. Consequently rocks in the interior of the earth are supposed to become molten at a lower temperature than would be necessary if they were melted by artificial heat on the surface.

RATES of commission charged for transactions in Utah mining stocks vary as elsewhere. On stocks selling to 5 cents $1.50 per thousand is charged; from 5 to 15 cents, $2.50 per thousand; 15 to 35 cents, ½ cent per share; 35 cents to $1, 1 cent per share; above $1, 1% on the money. There are several reputable stock brokers in Salt Lake City.

A GREAT source of error in working mines by the pillar system is the practice of leaving pillars in large deposits of the same size as those found to answer in smaller deposits. A vein 5 feet thick may be supported by a pillar of given size, determined by the character of the ground; but a pillar of the same size would not sustain the roof in a 20-foot vein in the same ground.

THROUGH the recent denouncement of Arizona mining fakes by the Governor of that Territory, it transpires that stock in some of the swindles was sold wholesale in the East to innocent "investors." In one little New York village $60,000 was thus "invested"—about all the money in the place. Doubtless all those who thus "invested" will pronounce mining to be a failure.

THERE will be a meeting of the Executive Committee of the California State Miners' Association in San Francisco on the 25th inst., to discuss the best way to effectually combat the present efforts of the Anti-Debris Association, which organization seems desirous to render nugatory the acts and to question in the State courts the jurisdiction of the California Debris Commission appointed by Act of Congress.

THE Homestake gold mines at Lead City, in South Dakota, were discovered in 1876, and now comprise the greater portion of the properties included in a gold-bearing zone 6000 feet long and 2000 feet wide, extending from Deadwood gulch on the north to Gold Run on the south. The principal mines are the Homestake, Highland, Deadwood-Terra, Father De Smet and Caledonia. There are a great many other claims in the group.

A PLOW-STEEL WIRE CABLE, according to the tables furnished by the makers of this class of ropes, will break of its own weight when 60,000 feet in length. An inch rope weighs 1.58 pounds per foot and breaks under a strain of 47 tons. A 2-inch rope weighs 6.3 pounds per foot and breaks under a strain of 189 tons. Hoisting engines should always be started and stopped slowly, for the sudden start or stop subjects the rope to a strain several times greater than the load.

THE United States Statutes provide, that where mineral veins are possessed, which possession is recognized by local authority, and to the extent so possessed and recognized, the title to town lots to be acquired shall be subject to such recognized possession and the necessary use thereof; but nothing contained in this section (2386) shall be so construed as to recognize any color of title in the possessors for mining purposes as against the United States.

ALL minerals excepting coal and iron are reserved from railroad grants. If the mineral character of land included within a railroad grant can be proven prior to issuance of patent to the railroad, the land belongs to the public domain and is open to exploration and purchase under the mining laws, the same as any other public mineral lands. The Supreme Court of California has held in several cases that in an action at law a patent issued to a railroad company can be attacked by showing that the lands in controversy are mineral lands.

TO ESTIMATE the percentage of sulphur in coal, one gramme of the finely pulverized coal is intimately mixed with four grammes of manganese dioxide, one gramme of permanganate of potash and one gramme of dry sodium carbonate. The mixture is placed in a platinum crucible, gently heated at first and afterwards to redness for thirty minutes. The crucible and contents are put into a beaker with water, acidulated with nitric acid and heated, the solution filtered and the sulphur precipitated with barium chloride in the usual manner.

WINZES and mill holes cut for passing ore or rock from stopes to level below, should never be driven under an angle of 35°, for at a lower angle rock will not run, and, if there is much fine material and wet, it will not run well at 35°. Where small veins dip at a lower angle than 35°, levels should not be over 75 feet apart, as shovelling must be resorted to, which makes mining expensive. Where broad veins lie at a lower angle than 35°, the raises may be put in to better advantage by starting on the foot wall side and raising toward the hanging.

AIR CURRENTS in mines sometimes do strange things. On the Comstock lode, in Virginia City, Nev., two shafts were connected by underground workings. One was an up-cast and the other a down-cast draught. A fire occurred in one of the mines, and the heat in the down-cast shaft overcame the natural air current and reversed it; it continued after the fire had been extinguished, the up-cast becoming the down-cast shaft. There are numerous satisfactory ways of ventilating mines and shafts by outdoor furnaces, blowers, exhaust fans, wind sails, water blast, etc., and by dividing the shaft into two compartments by an air-tight partition.

EAST of the Sierras fake advertising schemes no longer exist. West of the Sierras the books, souvenirs, programmes, "specials," survive. East of the Sierras no one will advertise in anything but a live journal with a good circulation among probable buyers. West of the Sierras the smooth talker is still able to coax advertisements from business men by telling what his book or other transient publication is "going" to be. East of the Sierras men have learned that money so paid is thrown away. West of the Sierras men have not yet learned that no transient advertising scheme has any business claim to patronage, as it cannot give any value for money received.

WHEN stopes are so wide that the square system of timbering is necessary, sills should always be placed on the floors of each level and these should always be long enough to reach the width of two sets at least and when possible three sets, in order to facilitate the work of connecting levels. Without these long sills it will be found a most difficult and dangerous undertaking to break through from a level to that above when stoping. Where filling is practiced, as it always should be in large stopes, a floor of heavy lagging laid on the sills will assist making connections. When the levels are connected by the stopes many pieces of lagging can be recovered, but often at a greater expense than their worth. When intermediate levels are opened between two main levels sills should also be laid on the floors of these levels.

THERE is no feature of mine development more important than providing for drainage. Tunnels and drifts should always be run at a slight grade, sufficient to insure the flow of the water toward the natural outlet or toward a shaft or sump from which it is removed to the surface by buckets or pumps. A drain should not only be provided, but should always be kept open. In large tunnels the drain is often placed under the center of the track, and this answers well where the flow of water is large, but where it is small the drain should be placed at one side or both sides of the track, where it is readily accessible and may always be kept clear of debris. Very often prospectors, in their haste to advance their work, fail to make proper provision for drainage and do poor timbering with disastrous results later.

MONTANA'S new law, senate bill No. 25, says: "Every person who sinks any shaft or runs any drift or cut, or causes the same to be done, within the limits of any city or town or village in this State, or within one mile of the corporate limits of any city or town, or within 300 feet of any street, road or public highway, and who shall fail to place a substantial covering or a tight fence around the same, is punishable by a fine not exceeding $1000. The owner of any property or his agent in charge thereof, or any person in possession of the same, shall be deemed to be within the provisions of this act if he permits any such shaft, drift or cut to remain open, exposed or unprotected upon his property, or the property in his charge or possession, for a period of more than ten days. Mining, irrigating and other ditches may be dug or cut to a depth not exceeding 10 feet without incurring the penalty of this section."

HYDRAULIC mining is legally defined by the Civil Code of California, as follows: "Hydraulic mining within the meaning of this title is mining by means of the application of water under pressure through a nozzle against a natural bank." Lieut.-Col. G. H. Mendell of the U. S. Engineer Corps in his report made pursuant to the provisions of the River and Harbor Act of 1880, upon a project to protect the navigable rivers of California from the effects of hydraulic mining, gives the following definition: "Hydraulic mining, as it is understood in California, is that process by which a natural bank is excavated by a jet of water and conveyed by the same water through the sluices to the dumps. Water does all the work; manual labor is useless to a perfect bank. When boulders are found too large to pass through the sluice they are sometimes blasted into smaller pieces. Where the bank is cemented or contains pipe clay, it is shattered by powder."

CHLORINE GAS is generated in the Plattner chlorination process in leaden vessels by the action of sulphuric acid upon a mixture of sodium chloride (salt) and black oxide of manganese. The gas is introduced under the charge in a large vat provided with a false bottom. A cover is luted onto the vat, rendering it air-tight. A small hole in the cover closed by a wooden plug affords a means of communication with the charge. When it is thought the gas has been passing into the vat a sufficient length of time, the plug is withdrawn and a bottle of ammonia held near the hole in the cover. If the gas has penetrated the charge and has reached the surface, this fact is demonstrated by the formation of a white cloud of ammonium chloride. When this test is sufficiently pronounced, the "gassing" is stopped. The terchloride of gold formed in the vat in this operation is washed out with water introduced at the surface of charge and allowed to percolate through the entire mass of pulp and is drawn off into another vat. The gold is precipitated from the solution by the introduction of iron sulphate.

IN each instance where the cyanide process is introduced at first it may be considered an experiment, for there are so many factors which have an important influence on the success of the operation that no rules can be established other than those of a most general character. Among the most important considerations are the condition in which the gold exists in the ore, size of the particles, whether or not the material is porous enough to make extremely fine crushing unnecessary, the tendency of the ore to slime, which influences the kind of crushing machinery employed and has an important bearing in the construction of the plant. Some ores can be successfully treated by agitation that can not be treated otherwise, some require roasting, others do not. In some ores the coarser sands and slimes are separated and are worked separately, others do not require it, and so on through a large variety of ores. Careful experiments should always be made in the laboratory on a scale sufficiently large to insure their reliability before a plant is built, or failure may follow what have been considered successful laboratory experiments.

A GREAT deal of effort has been made in all parts of the world where mining is carried on to great depth to arrive at a satisfactory average of the increase of temperature with depth. A few years ago it was commonly assumed to be one degree for each 90 feet in depth. More recently deeper workings under other conditions have led to the belief that it is something over 200 feet for each degree of increased temperature. The fact is that the depth to which mining has thus far been carried is so shallow as compared with the great distance to the center of the earth that it is not known what the average increase of temperature with depth is. The observations made at the various places have been where the surrounding conditions were so different that the tests are not satisfactory. The bottom of the deepest shafts in the Lake Superior region, 5000 feet below the surface, are not so hot as levels only half as deep in the Comstock lode in Nevada. In some instances in the Comstock the water was scalding hot, reaching 158° F. and a man falling into a sump where water is at that temperature has usually been scalded to death before he can be rescued.

WHEN applying for a patent to a mining location, the application must contain a copy of the plat; certified copies of all location notices, original and amended, upon which the order of survey was based and under which claimant asserts title; proof of posting on the claim the notice of intention to apply for a patent, and copy of the plat; proof of citizenship of the claimant; agreement of the publisher of the newspaper published nearest to the claim, designated by the Register as the one in which publication is to be made; proof that annual labor has been performed, showing the location to be valid and subsisting at the time the application for patent is made; abstract of title or proof of possessory rights where there is no record title; where the land is borne on the tract books as agricultural, proof of its mineral character. The application for patent and accompanying instruments are filed by the Register upon the payment of his fees ($10), if the land is clear on the tract books. If the land applied for appears from these books to be wholly or in part covered by a previous entry, a homestead filing, or a prior pending application for a mineral patent, or is included within some antecedent reservation or executive withdrawal, the Register will decline to receive and file the papers until the obstacle is removed. The proceedings to obtain patents to lode mining claims are generally applicable to placer locations.

ORDINARILY miners who are washing gravel are anxious to get rid of black sand, but recently there has been an effort to save the sand and ship it to the smelter for the gold it contains. All black sand does not contain gold in paying quantity, but some of it is rich in precious metal. By the ordinary process of sluicing it is a difficult matter to save both gold and black sand, but presumably it may be done by an ingenious arrangement of sluices. The material should first be screened or passed over a grizzly to rid it of coarse material, which will increase the capacity of the sluices. The upper two lengths of sluice should be set at a grade sufficient to keep the sand moving while the gold is retained. These boxes should be lined on the bottoms with gunny sacks or Brussels carpet. The remaining boxes should be set at a grade which will permit the sand to settle and fill the spaces between the riffles while the lighter material passes on. A long sluice will be required if a large tonnage is to be handled, as the riffles will quickly fill and the black sand will ripple over the top of the riffle bars and pass on to the next section. The riffles take up about 60% of the superficial area of the box. In a sluice 1000 feet long and a foot wide, the riffles being 1¼ inches high, the quantity of sand retained by the riffles will equal about 50 cubic feet. If the concentrate is clean iron sand it will weigh, when dry, from four to five tons. The above plan is for a plant requiring no power. If very large quantities are to be treated, and the percentage of sand and the volume of material to be treated justify it, a plant of machinery consisting of revolving screens, jigs or other mechanical concentrating machinery could be successfully employed. Of the black sand in streams and elsewhere a very variable proportion is magnetic.

Steel Head Frames for Mines.

Written for the MINING AND SCIENTIFIC PRESS by GEO. S. BINCKLEY, Butte, Montana.

The use of steel for head frames is particularly advantageous where the structure is of large size, or where there is difficulty in obtaining suitable timber, for in the latter case the cost of a large steel head frame is little if any in excess of that of a wooden frame of the same height and strength, and the advantage of greater durability and safety from fire is often an important factor in the determination of the nature of the material.

In spite of the undoubted advantages of the steel frame, however, it is still somewhat of a curiosity even in districts where the conditions are such that the use of metal would be very desirable on all accounts. However, where they have been used they have not always been an unqualified success, owing to the fact that there has been in many cases a blind adherence to the traditional form of the wooden frames heretofore used. Mining men are very conservative, and tradition has frequently as much to do with the determination of the design as considerations of strength and durability. Some few engineers have realized the fact that the common forms of the head frame are very defective, and have made notably rigid and economical structures; the one at the Oneida mine, Amador county, Cal., designed by Hans Behr, and the one at the Pennsylvania Hill, at Grass Valley, designed by Arthur de Windt Foote, the manager of the North Star properties, being conspicuous examples of good design.

STEEL HEAD FRAME, HIGH ORE MINE, BUTTE, MONTANA.

Many of the earlier examples of steel frames have retained the same defects that have existed from time immemorial in the wood frame, and are designed with the same utter disregard of the nature of the strains that the structure is subjected to, and in the case of some frames in South Africa, the material used and its possibilities as regards bracing and distribution are ignored, and the design is exactly the same as if it was of wood. Its type is the same as that illustrated by the sketch, Fig 1, which is one of the most common forms of the wooden frame, in which it is seen that there is an elaborately braced structure rising directly above the shaft, with the sheaves resting near the ends of heavy timbers laid across the caps. A moment's study will demonstrate that the resultant of strains due to the tension on the ropes falls entirely outside the rectangular structure that is so elaborately braced and counterbraced, and which is evidently considered so important a feature, and comes almost entirely on the diagonal back braces of the frame, and on the vertical members of the square tower which are on the same side as the back braces. This simple fact seems never to have been understood, for the ropes are always in the center of the square tower, as if the weight was hung from the sheave timbers, and the back bracing seems to have been considered merely as a safety member, and not as the one that would have to stand most of the strains that the structure is subjected to.

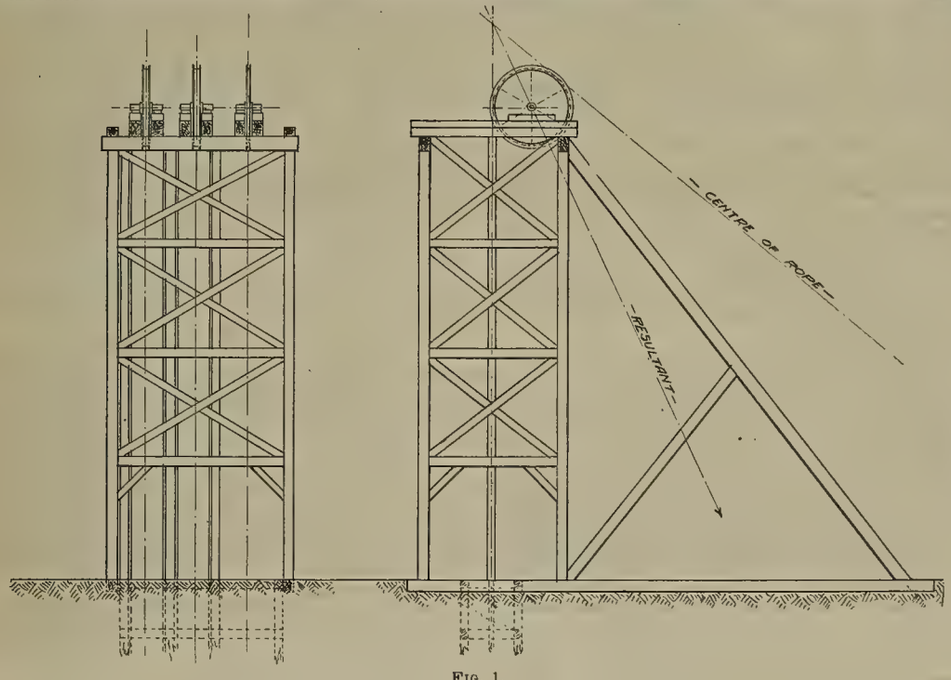

FIG. 1.

The consequence of this is that enormous amounts of timber are used in these structures and they are not as stiff as a correctly designed frame employing but half the amount of material used in their construction. When these methods are extended to the design of steel frames the effect is likely to be disappointing, for in comparison with wood, steel is not nearly as rigid, strength for strength, and while the wood frame might be reasonably satisfactory, one of same design in steel would be a failure.

Another form of wood frame is shown in sketch Fig. 2, which illustrates the form most common in Montana, where the frame is of large size. This type seems to be an effort in the right direction, but an abortive one. The main compression members are inclined, but are not placed in the line of the resultant of the strains on the rope. This form combines the defects of instability and waste of material to almost the extent of the one before instanced, although it has not the feature of the square tower over the shaft.

In this form of head frame the heaviest member is placed at an angle, with its foot back of the shaft, and the head inclined far enough forward for the sheaves to come to position over the center of the hoisting compartment.

Another member, in the nature of a back brace, is carried off toward the engine, and the resultant of the strains on the ropes falls between these two members. In front of these is another brace, the purpose of which is not susceptible of mathematical demonstration, if it is assumed that the structure is sufficiently tied together to keep it from falling to pieces from its own weight. This brace is also carried out forward from the shaft, and the whole structure rests on two sills running along under the ends of the three braces. As will be seen, all these members are vertical in the end elevation, and the sheaves are carried on long timbers reaching from one side of the frame to the other, a measure of stability being secured by the knee braces shown.

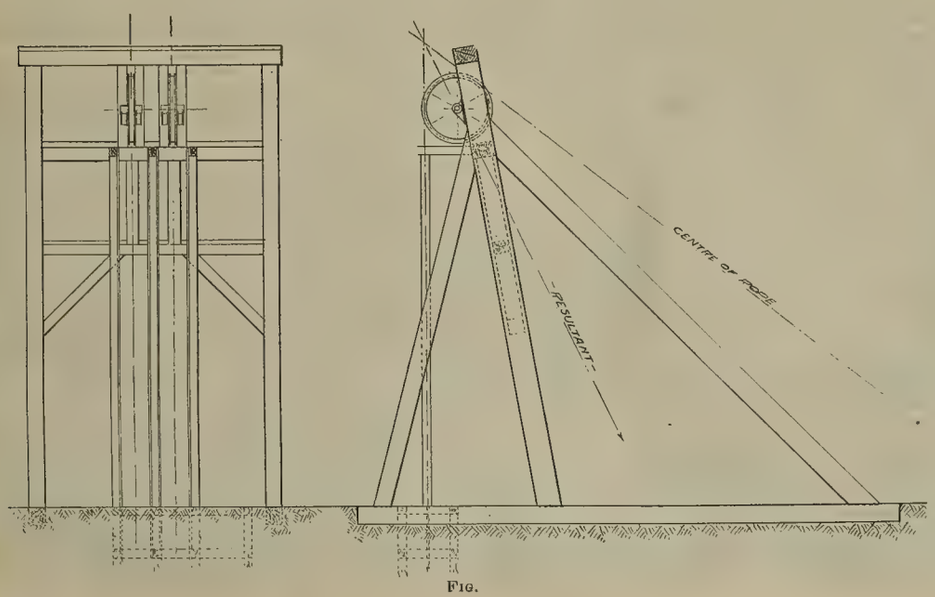

FIG.

These details would be of small interest but for the fact that this type of frame is used in connection with the heaviest hoisting engines in the West—the engines at the Montana Con. and the Neversweat mines of the Anaconda Co. in Butte. The timber used in these frames is 24 x 36 inches and was brought from Oregon. The frames are less than two years old, and cost a pretty sum, but the one at the Neversweat is about to be torn down, to be replaced by a steel frame, and neither of them is

stable, in spite of the enormous amount of material used in their construction.

The spread of the legs at the base is 38 feet, and height to the center of the sheaves is 60 feet, and with the same amount of material distributed as Mr. Behr has done in the frame of the Oneida mine these frames might have been made absolutely rigid.

The types of frames illustrated by the sketches herewith are chiefly interesting in their defectiveness, like many other things, and merely indicate the necessity of ignoring tradition in the design of steel structures for the same purpose, for if this is done there is a chance for some good engineering and a surprising economy of material. In the steel frames that are being erected on the Neversweat and High Ore shafts of the Anaconda Co., illustrated herewith (the illustration being taken from the High Ore), the conditions were rather unusual, and the amount of material that was used was a secondary consideration, for it was desired that the structures should be extraordinarily strong and stiff, and the fact that in the case of the Neversweat frame the dimensions of the base were already fixed by the position of the engine and ore bins made it desirable to take every precaution as to rigidity, as the height of the new frames was fixed at 100 feet, to the center of the sheaves. For these reasons the weight of the structures is somewhat in excess of that which would be required if the conditions were more favorable to the proper proportioning of the height and the base; and if this was not fixed by existing circumstances the weight could probably have been brought down at least 25%. The conditions at the High Ore mine were almost identical, and with a few minor changes the frames are the same, having a base of 38 x 65 feet and a height of 100 feet to the center of the sheaves. The weight of each of the frames, complete, including the steel guides and hoppers for the self-dumping skips, is about 312,000 pounds, this amount being the weight of the steel and not including the cast iron bases and the anchor bolts. These bases are a feature of some note, for on account of the fact that the ground near the shaft is likely to move there is a vertical adjustment provided in the bases by means of which the vertical alignment of the frame can be preserved, even if the ground should settle a foot. Where the base is so small as in these frames this adjustability is of great importance, for without it the whole structure would be subject to serious displacement. This adjustment was suggested by the former supervising engineer of the Anaconda Co., Mr. Ames, who probably originated it.

The use of self-dumping skips in the Neversweat and High Ore mines in connection with these frames makes it possible to secure an enormous extraction and very great economy in the handling of the ore, for in both of these places the conditions are such that it was possible to arrange the ore bins below the collar of the shaft, so that the skips will dump directly into the bin without the necessity of any tramming or handling of any kind, and the railroad by which the ore is shipped to Anaconda runs below the gates of the bins, so that it may be said that the ore runs by gravity from the skips to the smelters, there being no handling from the skips to the cars, and the road being down grade all the way to Anaconda. Loading chutes are provided at the stations below ground, with gates operated by compressed air, so there is almost no time lost in loading; and at the Neverwseat, where the skips hold ten tons of ore, the extraction per day is frequently 1200 tons, although so far only one skip has been used. With two skips the extraction could be made almost anything desired, for running in balance a higher speed could be obtained, and far greater economy in operation.

At the High Ore mine the conditions are about the same, but the engine is not as large and the extraction will never be so great, five-ton skips having been provided for. However, the extraction may easily reach 1000 tons per day, and this is doing pretty well for one mine. The conditions were not so favorable for the economical handling of the ore at this time as at the Neversweat, for in order to get the railroad at a point below the bins, as in the other case, it was necessary to make a cutting about 500 feet long with an average depth of 25 feet, much of it through rock. However, the saving in the handling of the ore was so great that the expense was well justified, and it will make one of the most economical plants in the West. The engine is double direct-acting, cylinders 30x72 inches, with Corliss valve motion and poppet valves, built by the Union Iron Works of San Francisco, duplicates of this being in use at the Anaconda and St. Lawrence mines, and one is also in use at the Homestake mines at Lead City, S. D. All of these engines are well housed in steel and brick buildings, and all used by the Anaconda Co. are provided with steel head frames, the frame at the St. Lawrence being the first steel frame erected in Butte, but being also the least satisfactory, as it was designed without sufficient attention to the requirements of rigidity, and vibrates considerably under heavy work.

In the design of the steel frames for the High Ore and Neversweat mines the writer was governed in the proportions employed, as pointed out before, by the extraordinary stability demanded and conditions that limited the area of base, but the general principle of the triangle was strictly adhered to throughout the structure, not alone in the bracing of the panels but in the relations of the main members to each other as well, the two triangles forming the side panels being spread as far apart as possible at the base, and brought as near together at the top as the sheaves would allow, making the box girders that actually carry the weight as short as possible, and distributing the strains from near the apex of the pyramid formed by the axes of the four main members, the resultant falling about midway between the front and back panels of the structure.

This form of frame is undoubtedly as rigid as any that could be designed with the same base and altitude, and where the question of material is not of overwhelming importance it will probably remain the form most used, but in cases where the cost of material, erection and freight is so great as to call for the best possible use of material and labor, it would be possible to design a frame that, although not more rigid than the form above discussed, would be equally so, and would not require more than about 60% of the amount of material. In this form the main strength would be concentrated in a panel set in, or a little back of, the plane of the mean resultant of the strains due to the tension on the ropes. No matter how suddenly this strain is applied, the resultant is always the same, and the strain on the panel could only be compressive, having no tendency to pull it back or throw it forward. This being the case, the rest of the structure could be designed with only sufficient strength and rigidity to carry the weight of the main compression member, which, owing to its inclined position, would tend to fall toward the shaft.

The part of the structure in front of the main compression member would be merely a light framework, with its main members designed to resist tension rather than compression, and would carry the guide posts and part of the platform surrounding the sheaves. It would be well anchored to a heavy foundation, so that in case of overwinding (when the resultant, owing to the fact that the cages would foul the sheaves, would fall outside the axis of the main member, and would coincide with the center of the rope), the vertical members of the light bracing would be able to resist the tensile strain that would result and prevent overturning the structure, the strain possible being proportionate to the strength of the rope, the base in side elevation to the structure, and the distance from the base of the main member to the center of the rope, at right angles to the rope. This last distance would always be somewhat greater than the base of the structure in side elevation, owing to the fact that the vertical members of the front bracing would be set back of the shaft, but the difference would not be so great and the limit of tension that could come on these members through the fouling of the cages would be practically the strength of the rope, and it is plain that if the section is sufficient to sustain the weight of the main compression members, it would be amply strong in tension to break the rope.

In the end elevation of this type of frame the main compression members would be brought as near together at the top as possible, and well spread at the base for lateral stability, but the front bracing could be vertical and consist of three main members tied to the compression panel with light braces, firmly connected at the top and well anchored at the base to a heavy foundation.

Although this design is, in the opinion of the writer, perfectly practical and based on correct mathematical principles, it is so revolutionary and defiant of all tradition that it is doubtful if most mine managers would have the courage to construct one on these lines, and so long as the form that has been adopted for the Neversweat and High Ore mines is not considered too expensive, there would be no particular object in using this, but where the question of freight and material is of the first importance this design certainly offers a method of obtaining the greatest results for the amount of material employed, and by the introduction of iron tension rods in the vertical members of the front bracing the design is as well applicable to a wooden frame as to steel, and the economy of material equally striking.

In the design of several large steel frames besides those at the Neversweat and High Ore mines the writer has followed the same general lines, but for two of these—80 feet high to the center of the sheaves, although of great strength and stiffness—the weight of each was about 165,000 pounds, including the cast-iron bases. However, the design above referred to as the one for the greatest economy of material would in this case have effected a saving of fully 45% in the material used, which in the present state of the iron market amounts to a pretty figure.

This design is merely offered as a suggestion, and may be found of value under the conditions named. Conservatism is a pretty good thing in its place, but it should not be allowed to interfere with business.

MANY of the old sources of the world's nickel supply are practically exhausted. Ore is still obtained from Norway and Hungary. South Africa supplies an arsenide containing over 25% cobalt.

Some Experiences of a Working Miner.

NUMBER XXV.

Written for the MINING AND SCIENTIFIC PRESS.

Almost any one who has a grain of sense is presumed to know the difference between coal and other black but incombustible rocks, but such seems not to be the case, for it is only a very few years since a company at C——, under the direction of a so-called expert, sunk a shaft 20 or 30 feet, and, when water drove the miners out, operations were confined to driving a tunnel into the hillside nearly 100 feet. All of this work was done in a black slate, as hard and almost as lustrous as anthracite coal, but not an ounce of coal was ever discovered. The most curious part of this business was that the people who paid for the work believed it was coal, for the expert told them so. Another odd feature was that within half a mile there were some small streaks of coal in sandstone, but nothing of value. Still what little coal there was there would burn, but the black slate mined by the parties above referred to would not burn in a thousand years, and yet this simplest of all tests was never tried on what was presumed to be coal.

* * *

Several years ago a company of men who had had some experience in mining, and I am told financially successful experience, undertook to open a new quicksilver mine at N—— A——. They selected a spot where it would be convenient to sink a shaft; where dump room was abundant and where, if they found enough good ore they could establish a camp without too much inconvenience or expense. The shaft was started in serpentine on a sort of flat or bench near the base of a steep hill. At the foot of the hill ran a small stream and on the opposite side of the creek was a ridge of rocks, perhaps 40 feet in height, in which were numerous blotches and streaks of cinnabar; in fact, a very fair prospect, though nothing more than superficial work had ever been done on it. There was not a sign of cinnabar in the serpentine, but it was a convenient place to sink and this seems to have been the main idea. The shaft was started at any rate and they did a very fair job of mining. The shaft was carried down 60 feet in serpentine when it entered a deposit of washed gravel and continued in this material to a depth of 110 feet, when being still in the wash, sinking was abandoned and a drift was started and run east 500 feet toward the main hill which rises several hundred feet above the creek, when, becoming discouraged, work was discontinued. Hearing of this somewhat unusual occurrence, I visited the place to see if some suggestion could be gotten from the surroundings, which would indicate the cause of the serpentine lying upon washed gravel. Before going there I had an idea of what must have occurred, and upon reaching the place a single glance at the steep hillside above the shaft showed plainly what had occurred. Many years ago, but at a very recent time, geologically speaking, a great landslide had taken place. A segment of the hillside 1000 feet in length and about 300 feet in width at its widest place, opposite the shaft, had slid from near the top of the mountain side, which was solid serpentine. The creek had evidently at one time been a much larger stream than now and had in the course of time deposited a large amount of gravel in its bed. This must have been the case as indicated by the gravel found in the shaft where it was at least 50 feet in depth and 500 feet wide. The great mass of serpentine had slid down upon the accumulation of gravel, choked the channel of the stream, which had cut for itself a new course at the contact of the slide and the rocks on the opposite hillside. Smaller landslides had occurred all along the mountain slope for a distance of a mile or more and in each case the dislocated material had piled up a mound directly below on the slope of the mountain or at its foot, and the largest of these mounds was the bench upon which the shaft had been started. One would naturally presume that the miners could scarcely have failed to have noticed this, particularly after the shaft passed from serpentine into washed gravel, but they did not.

* * *

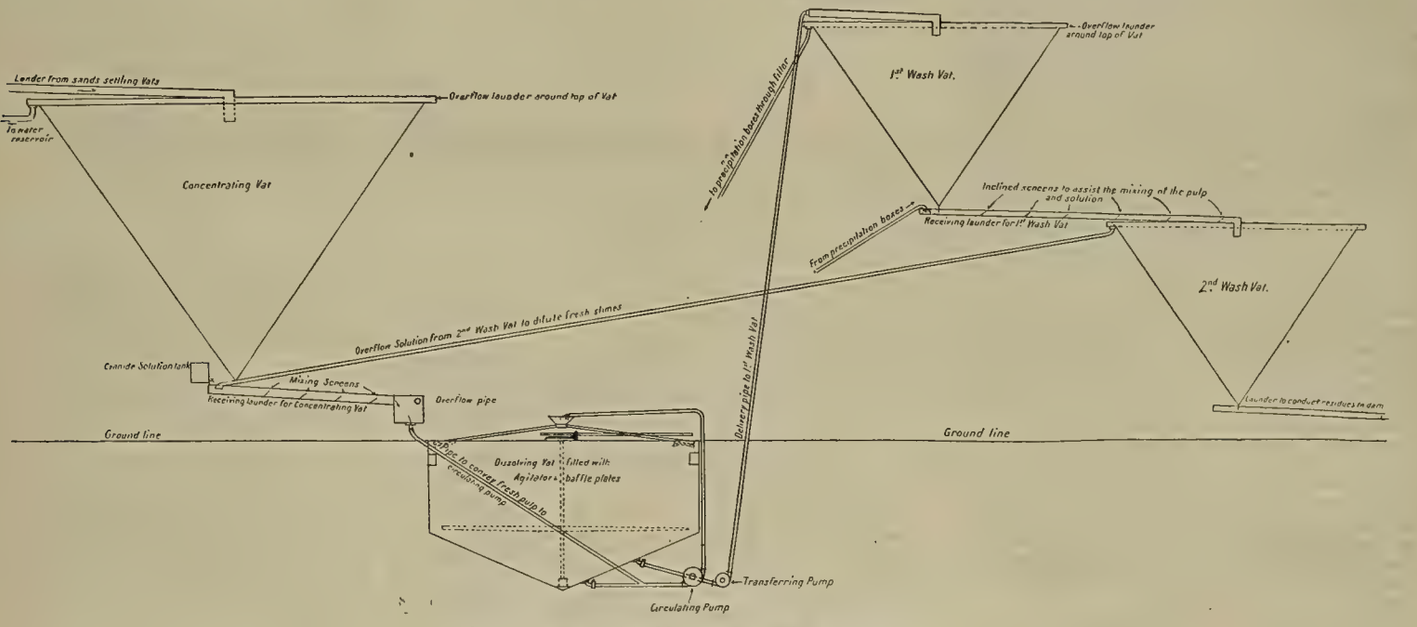
At the head of one of the tributaries of D—— creek was found a lot of float boulders of quartz, rich in lead and silver. These fragments of ore were scattered along the gulch for several hundred yards and near the evident source of the ore the rocks were large, a foot or two in diameter. Numerous pits were made in search of the vein from which these boulders came. The pits extended all along the gulch, but wherever deep enough to reach bedrock slate was found and no ore. Step by step the prospectors worked up the gulch and, still finding nothing, a large cut was made in the side hill, where boulders of ore were found in the loose earth, but with the same result as before—slate but no ore. Just beyond the cut was an abrupt cliff of porphyry with a talus of porphyry at its base. Back from the edge of the bluff several yards could be seen the remnants of shale and thin layers of limestone lying flat. In this a shaft was started, and continued

about 6 feet, when, entering porphyry without a sign of ore, work was discontinued and the prospectors left, satisfied the float had been carried into the gulch on ice from some distant region. Later another prospector came upon the float, and noticing the numerous cuts, followed them to the large cut below the bluff. Finding no ore but seeing fragments scattered in the alluvial, he rightly concluded that the ore lay under the porphyry and, acting on this judgment, in a day or two had uncovered a valuable ore deposit. The difference between these two parties lay in the fact that one worked with his muscles and with a will but his reasoning power could not carry him a foot beyond the last piece of float. The last fellow was a close observer and at once located the place where in all reasonable probability it should be found, and there he found it as he had supposed.

* * *

Some good ore was found at S—— D—— and a number of prospectors went there as they do to every new find. The extent of the ore deposits were never determined, for they were not properly explored. The most promising claim showed a quantity of ore in the loose earth and rock on the hillside and a cut was run in to develop it, and in this cut a shaft was sunk. Soon all trace of ore was lost, but the shaft was continued for some depth but never encountered any more ore, and the district was abandoned. I have never been there since and do not know even now that the ore shoots which created the first excitement have ever been discovered, but beyond a doubt the work was done too far below the outcrop. MINER.

A Continuous Process of Slimes Treatment.*



By ERNEST T. RAND.

I wish to bring to notice a process the practical details of which I have been working on for a considerable period. We know that the probable ideal method of treating slimes will be by some continuous process of one kind or another, and I shall describe a process which I think approaches towards this end. I do not claim that it is a perfect process. Perfection will only be attained by increased experience.

I may say that the slimes are, from entering the works until finally treated, in a constant state of movement. The process itself may be conveniently subdivided into four different stages. In the first stage the slimes pulp from the overflow of the sands settling vats passes into large spitzkasten or inverted conical vats, with the sides at an angle of 55° to 60°. These vats or spitzkasten are of sufficient capacity to settle the slimes to a consistency of one or one and a quarter wet to one of dry slimes. A settlement equivalent to three hours is given to these, that is, a certain proportion of the pulp will take three hours to fill one of the vats without anything being drawn from the bottom and before the clean water begins to overflow.

An inverted conical vat with delivery of slimes pulp at center of vat is preferable to a spitzkasten owing to the much larger overflow line. When the vat begins to overflow the nozzle at the apex of the cone is opened and the slimes allowed to flow out in a very thick, continuous stream. It is desirable to have the vats large, in order to be able to use a large nozzle, as a small one which would necessarily be required for a small vat would, owing to the very thick pulp, be more liable to choke. The overflow water can be taken back directly to the water dams by pump or gravity, according to circumstances. The pulp leaving the vat passes into a V-shaped launder, fitted at intervals with ¼ inch mesh screens inclined in the direction of flow, and occupying two-thirds of the depth. The object of these screens is to cause the slimes and the solution added at the head of the launder to mix thoroughly. The quantity of solution added is that required to bring the pulp to a consistency of four and a half of solution to one of dry slimes. Fresh potassium cyanide is added at the head of the launder in sufficient quantity to make the strength 0.015%. Lime is also added, principally to assist settlement after the dissolving of the gold has been effected. At the lower end of the launder is a box into which the pulp is delivered. To the side of this box near the top is placed an overflow pipe, which would come into use should a stoppage occur. The pulp from the first settling vats could thus be run into some suitable place, whence it could be taken and worked when the plant is again running.

The second stage comprises the solution of the gold in the dissolving vats. There may be one large vat or, still better, two smaller vats to work simultaneously. These are constructed with conical bottoms, the vats having two-thirds of their total depth with vertical sides, the remaining one-third being conical. This arrangement ensures that no deposition of settled slimes takes place on the bottom. These are together of a capacity equal to that required to contain the pulp run into them from the first settling vat for seven hours, without anything being permanently withdrawn. The vats are each fitted with an agitator, the speed of the ends of the blades being about 620 feet per minute when in motion. A circulating pump capable of passing through all the pulp contained in the two vats once every one and a half hours, connected to a hole near the bottom, is used to circulate the pulp already in the vat, and to introduce the pulp from the first settling vat. This circulating pump delivers into a pan placed over the center of each vat, and from the bottom of which radiate a number of pipes closed at their outer ends and perforated by a number of small holes in each, in order to spray the pulp (thus producing a slight aeration) as near the periphery of the vats as possible. The vats are fitted with baffle plates placed near the surface of the pulp, in order to cause the greatest possible mixing of the freshly introduced pulp with that in the vat. Into the suction pipe of the circulating pump, at an inclination towards the pump, is introduced a pipe leading from the box into which the pulp from the first settling vat flows. The dissolving vats, if possible, should be placed so that their top is slightly below the bottom of above box. This pulp then flows from the first settling vat into the suction pipe of the circulating pump by gravity. Air may be introduced into the pulp by checking the passage in the suction pipe leading from the dissolving vat, the air passing down the fresh pulp pipe. As will thus be seen, the fresh pulp receives a preliminary treatment in the pump before entering the dissolving vat. A pump having its suction pipe with valve fixed half way up the slope of the conical bottom draws the pulp away from the dissolving vat at the same rate as it passes into it from the first settling vat. By this means a constant level is maintained in the settling vats. As it takes seven hours to fill these vats, the pulp practically receives a seven hours' treatment. I say practically because, though some of the pulp may get away before it has received its full seven hours, other pulp in the vats must receive as much more as the former receives less. Therefore, since there is no reason why pulp with gold undissolved should get away before that which has its gold dissolved, the time for dissolving in the vats may safely be put down as approximately seven hours. This time, by the way, is in excess of that usually given to present production slimes as at present generally treated. The pump drawing away the treated pulp from the dissolving vats delivers into an inverted conical vat (this being the third stage of the treatment) of such dimensions as to give the pulp three hours settlement. This represents the first wash. The overflow from this solution passes through a suitable filter to the precipitation boxes, and from these into a sump, whence it is pumped to mix with the pulp leaving the bottom of the first wash vat. This pulp is, as far as possible, regulated to the consistency of that leaving the first settling vat. The pulp from this vat or spitzkasten passes into a V-shaped launder, also fitted with similar mixing screens. There it is well mixed with the solution from the precipitating boxes and by gravity runs into the center of a vat in every respect similar to the first wash vat. This brings us to the fourth stage of the treatment, where the second wash takes place. The overflow solution from this second wash vat passes to the head of the launder, carrying the pulp from the first settling vat, and forms continuously the solution necessary to be strengthened for the fresh slimes. It will be seen that no solution storages are necessary. Of course, when there is loss is from leakage, evaporation, etc., the solution can be maintained by a water service. The slimes from the second vat pass to the residue dam. The consistency is the same as that leaving the first settling and first wash vats. Thus, from the 4½ water to 1 of slimes delivered into the center of the first wash vat 3½ parts is taken away to boxes, and the same quantity from the second wash vat, and so 6½ tons of solution will have been separated out from the slimes in the treatment of every ton. The slimes treated by this method require three hours in first settling vat, seven hours in dissolving vats, three hours in first wash vat and three hours in second wash vat—in all sixteen hours from entering the works until discharged with gold extracted.

CONTINUOUS PROCESS OF SLIMES TREATMENT.

So much for the explanation of the process, and now for some practical results. I shall now describe an experiment worked at the Simmer & Jack slimes works with this process on a fairly large scale and give particulars of the results obtained. Two of the dissolving vats were used, both being connected to a centrifugal circulating pump. The first was used as a pulp storage. In this way a pulp of a consistency of 4½ to 1 was made up in it, water—not cyanide solution—being used. The agitator of the vat was kept going to maintain the pulp in a uniform consistency. The second vat was used as the dissolving vat, the supply of the untreated pulp being drawn from the first vat. Near the bottom of the dissolving vat a pipe, with valve, was fixed. This delivered into a launder which conveyed the pulp to a settling vat. This vat was 24 by 8 feet deep, and had been made into the form of an inverted cone inside, although the angle of the slopes of the sides was not acute enough for the best work. Eight inches of 1¼-inch pipe, terminating in a $\frac{5}{16}$-inch nozzle, was fixed to the apex of the cone. Around the top of the vat was a launder, to which a pipe delivering into the precipitation boxes was fixed.

*From the Journal of the Chemical and Metallurgical Society of South Africa.

The solution from the vat overflowed into this launder and passed through the pipe to the boxes. The launder from the dissolving vat delivered the pulp into the center of the vat and at the surface of the solution in such a way as to cause no appreciable motion of the surface of the solution. The method of working this experiment was as follows: The pulp was drawn from the first vat at a rate equal to ten tons per hour, and passing through the circulating pump was delivered into the dissolving vat along with the pulp being circulated. The cyanide was added to the pulp in the dissolving vat; a very strong solution was allowed to drip into the vat, thus maintaining a fairly even strength of .014%; forty pounds of lime was added every four and a half hours. A quantity of pulp equal to that coming into the dissolving vat from the first vat was drawn off continuously, a normal level of the pulp in the dissolving vat being maintained. This pulp passed directly to the settling vats. The solution overflowing from this was quite clear, the surface of the slime being kept from 9 inches to 1 foot below the overflow rim. The pulp taken from the bottom could have been better concentrated had the angle of sides of vat been more acute. It contained 40% of dry slimes, so three of the four and a half parts of solution were separated and passed to the precipitation boxes. The experiment lasted three weeks and a little over 1000 tons were treated. The cyanide used worked out .5 pound per ton. A second wash was not given, as there were no conveniences for doing so; but I shall leave you to judge for yourselves what the results would probably have been had a second wash been given, after putting before you the results of one wash only. Of the residues leaving the settling vat a sample was taken every two hours; part of this was put into a pail containing clear water and part into a jar. Every twenty-four hours samples of unwashed and thrice water-washed slimes were sent to be assayed—the washed and the unwashed being part of the same sample taken from the settling vat. Thus a very fair comparison could be made. A sample of the overflow solution from settling vat was taken every two hours, and daily assayed. The original value of the pulp averaged 1.8 dwts.

The following are the results of a few of the residues obtained:

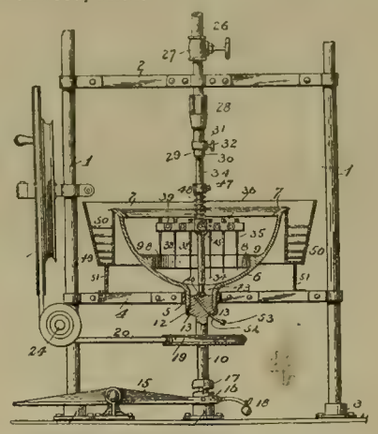
	Dwts. per ton.
April 6th, unwashed residue	0.3
April 6th, washed residue	0.05
April 8th, unwashed residue	0.15
April 8th, washed residue	0.10
April 10th, unwashed residue	0.15
April 10th, washed residue	Trace
April 12th, unwashed residue	0.40
April 12th, washed residue	0.20
April 18th, unwashed residue	0.50
April 18th, washed residue	0.10

The solution overflowing from the settling vat assayed:

	Grains per ton.
April 7th to 10th	9.5
April 15th	8.0
April 20th	6.0
April 28th	9.0

Latest Mining and Metallurgical Patents.

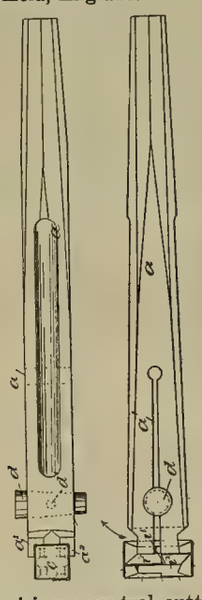
Patents Issued July 11, 1899.



Specially Prepared for the MINING AND SCIENTIFIC PRESS.

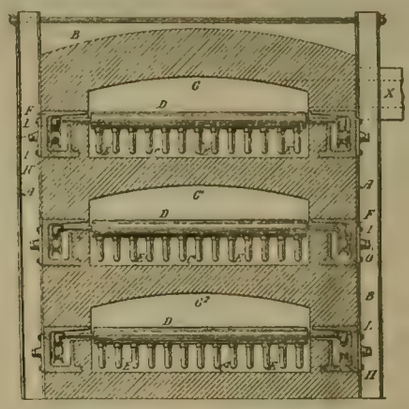
CONCENTRATING AND AMALGAMATING MACHINE.—No. 628,697; G. R. Couls and P. P. Dohlgreen, Tacoma, Wash.

A separator consisting of a reservoir, a hopper mounted to rotate therein, means for giving hopper a vertical vibration when being rotated, a screen extending from the upper edge of the hopper to the upper edge of the reservoir for screening the material passing from the hopper, an amalgam plate arranged beneath the screen, a partition located within the reservoir so as to form a pocket, a pump, a pipe leading from the bottom of the reservoir to the pump, and a pipe leading from the pump to a point above the hopper. A reservoir consisting of a suitable casing, a spindle journaled in the bottom of reservoir, a stationary cam block, a hopper having cam projections upon its under side, projections resting upon the cam block, a shank projecting downward from the hopper and having a socket therein for the reception of the squared end of the spindle, means for rotating the spindle, a pump adapted to be actuated in unison with the rotating of the spindle, a pipe leading from the bottom of the reservoir to pump, a second pipe leading from the pump to a point above the hopper, a guard *W* surrounding the hopper to prevent the spilling of the water, sand and flour gold so that it must of necessity fall on the amalgam plate, a screen extending from the upper edge of the reservoir, an amalgam plate located beneath the screen, and a partition so placed within the reservoir as to form a pocket for the retention of sand and the like. Hopper mounted to rotate with the reservoir, means for giving hopper a vertical vibratory motion when rotating, a pump for withdrawing the water from the lower portion of the reservoir and projecting it upon the material within the hopper, means for screening the material passing from the hopper to the reservoir, means for collecting the precious metal from mineral, and a pocket formed in the reservoir for catching and maintaining sand and the like so as to permit the water to pass to the bottom of the reservoir free from such material.



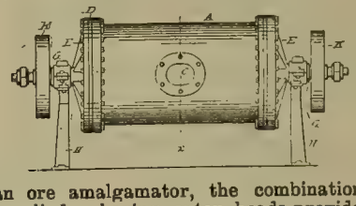
AMALGAMATING MACHINE.—No. 628,108; S. Moreau, Ironwood, Mich.

In an amalgamating machine, the combination with the vertically movable and rotatable pan, formed with a flange at the upper end and with an interior ledge between the ends, of the stationary water pipe, the rake arms, one of which is provided with a lug vertically movable on water pipe, the rake teeth, the collar on pipe and the coiled spring.



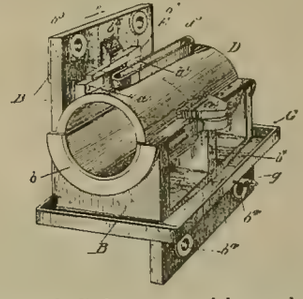
The vertically movable and rotatable pan formed with a flange at the upper end and with an interior circular concaved ledge, and the sluicebox provided with riffles surrounding pan, of the water pipe, the rake arms vertically movable on pipe, the rake teeth clamped between arms, the shaft secured to one of arms and stepped in the lower part of pan, the fixed and movable clamps, the yoke, the set screw, and the coupling with which fixed clamp is connected.

ROCK DRILL AND ROCK DRILL BIT.—No. 628,530; A. Gozzard, Sheffield, England.



A cutter comprising a central cutting ege, transversely extending portions at each end of the central edge, portions having thereon cutting edges and having also dovetailed abutments adjacent to cutting edges and forming recesses larger at the inner ends whereby the transverse portions provide the cutting and holding means; a central cutting edge with dovetailed abutments located to one side of the central edge to receive dovetailed parts on the holder, central edge being provided with oppositely arranged bevels and being also produced beyond the transverse edges; the reversible cutter having the central and transverse cutting edges with dovetail recesses, and the holder having the split end with separated dovetails a^2 one on each side of the central edge with the taper plug for spreading the parts; the holder having a split end with dovetail portions to engage the cutter, and a cutter having a plurality of cutting faces with dovetailed abutments to engage the dovetail portions of the holder.

CALCINING FURNACE.—No. 628,077; W. B. Devereux, New York, N. Y.



The combination with the side walls and the roof of a calcining furnace, of a hollow metallic girder having three sides closed and the fourth side divided by a continuous slot extending throughout its length, set longitudinally into the wall of the furnace, with its outer face set in the plane of the exterior wall of the furnace and forming the exclusive support for the side walls and roof above channel, and with the slot opening into the interior of the furnace throughout the length of the bed; a suitable hearth; two hollow metallic channels, constructed in and forming integral parts of each side wall of such furnace, on each side of the hearth; mechanism for stirring the material on the furnace bed, and means within each channel for supporting and moving the stirring mechanism over the furnace bed.

ORE AMALGAMATOR.—No. 628,499; J. E. Sutphen, Albany, N. Y.

In an ore amalgamator, the combination of a rotary cylinder having outer heads provided with hollow trunnions, heat receptacles formed about the shell and ends of cylinder in communication with the openings of trunnion, and a roller having a smooth outer surface arranged within cylinder. Heads having closed central portions separated from the outer cylinder heads to form heat chambers communicating with the openings of trunnions and provided on their outer edge with opening communicating with the longitudinal chambers of shell, and a roller having a smooth outer surface arranged within cylinder. A rotary cylinder having its shell provided with longitudinal heat chambers, of outer cylinder heads provided with hollow trunnions, and inner cylinder heads having closed central portions separated from the outer cylinder heads to form heat chambers communicating with the openings of trunnions and provided on their outer edge with openings communicating with the longitudinal chambers of shell.

JOURNAL BOX FOR STAMP MILLS.—No. 628,447; T. W. Capen, Chicago, Ill.

In a cam shaft box comprising a lower right angular base provided with an oil trough, a semi-cylindrical bearing portion supported thereon and an upwardly extending flange portion, a semi-cylindrical cap portion provided with two lugs on its inner lateral edge, a lug and stud on its outer lateral edge adapted to enter a recess or opening in the outer lateral edge of the box proper, a lug on the upwardly extending flange of the box proper arranged above and between the lugs on the cap, and a wedge arranged to be driven between the lugs on the box and cap to secure them together.

Characteristic Mines of the California Gold Belt.

From Quartz mountain, in Tuolumne county, northward to Carson hill, in Calaveras county, the mines are of a type similar to those near Poverty hill—the Mazeppa, Jumper, New Era and Golden Rule—described in previous articles on this subject, and these latter, in a general way, are very much like those farther south near Coulterville, in Mariposa county. In all these mines the structural geology is much the same and consists essentially of a zone of greater or less width—from a few feet to over 300 feet—of dolmitic mineral, in part ankerite, throughout which occur large and small masses of quartz in the form of lenses and vein-like sheets. These are disposed in various positions throughout the mass of dolomite, sometimes on or near the hanging wall side of it, and sometimes near the foot wall side, and in many instances there are several of these veins, or lenses, occurring abreast in the dolomite. They also vary greatly in size, from small seams to great masses 10 to 30 feet wide, and, when large, their outcrop often forms a striking feature of the landscape. These large lenses of quartz are usually parallel with the strike of the dolomitic zone and are frequently connected by other veins which cross the strike of the dolomitic zone in various directions, constituting a netlike mass of reticutaled veins. The inclosing formation varies from place to place and is not constant. The most prominent rocks occurring as walls to the dolomite are black slate, diabase, diorite and amphibolite schist, resulting from their alteration, serpentine, gabbro and a dyke rock of granitic type. These are the distinguishing features of the dolomitic zone from its most southerly occurrence in Mariposa county to Carson hill in Calaveras county. In Tuolumne county, near Tuttletown, the dolomitic zone commences to branch, and on Carson hill there are several distinct and large zones of this material, the occurrence of quartz in each of them being similar to that already described as being characteristic of the occurrences farther south, where confined to a single zone. Northward from Carson creek, on Chaparral hill, the first eminence north of Carson hill, several large and well defined quartz veins may be seen, but they occur in the amphibolite schists, serpentine and diabase rocks, and the dolomitic zone is no longer seen. It appears to terminate in Carson hill, where it has spread out, fanlike, in a number of sheets. And this is one of the strongest evidences which tend to the belief that the dolomitic zone, whatever may have been its original mineralogical character, is of eruptive origin. Structurally it possesses many of the features of large intrusive dykes, and in this respect is not unlike the diabase itself, which is so commonly associated with it, though seeming to be later than the diabase, and most of the other intrusive rocks along its course, excepting possibly the granitic dyke above referred to, which is seen along Moccasin creek and as far north as the Eagle mine, in Tuolumne county. After its disappearance at Carson hill, this dolomitic mineral is no longer seen in Calaveras county, as far as I have observed or ever heard, and not until Jackson, in Amador county, is reached does it again appear. Beginning just east of Jackson and extending for a distance of more than a mile in a northwesterly direction, the same formation reappears and has been extensively developed in the Bell Wether and Jackson Gate mines. Its structural conditions are similar to those observed in Mariposa, Tuolumne and southern Calaveras county, and includes large lenses of quartz with broad zones of reticulated veinlets throughout the mass, which in Amador is more than 100 feet wide.

Returning to Tuolumne county, it should be said of the numerous mines and undeveloped locations which cover every foot of the lode that they have developed some interesting facts concerning the distribution of the gold. At the Golden Rule and Jumper mines there is very little gold in the ankerite (dolomite) and not a great deal in the massive quartz lenses which accompany it, but appears to be confined chiefly to a zone of chlorite schist of variable width, usually very siliceous and associated with a dyke of rock which may be a type of diabase. In the Quartz mountain mines, a mile to the northward, the gold occurs in the large quartz masses chiefly. In the App mine the principal vein is near the foot wall. In the Dutch mine, just north of Quartz mountain, gold also occurs with auriferous pyrite in chlorite schist (amphibolite schist). Northward, or more properly northwesterly (for the entire gold belt has a trend 20° to 30° west of north, and a strike in any other direction is of purely local occurrence), as far as Table mountain, the mines have characteristics essentially similar to those at Quartz mountain. Along this distance are scattered a number of working mines. From the vicinity of the Dutch mine to Whisky hill, near Jamestown, the vein is not prominent on the surface and can only be found with difficulty; but at the crossing of Woods creek it again becomes prominent and continues with bold outcrops to Table mountain, two miles or more. From Whisky hill to the Alabama mine there are several places where extensive exploration has been carried on in the amphibolite schists which occur along the hanging-wall side of the vein. Here a broad belt of these rocks—chlorite schist and slate—has been found gold-bearing, and has produced a large amount of coarse gold from soft seams and veinlets of quartz. They have been worked by pocket miners in their peculiarly erratic manner. The schists in the neighborhood of Whisky hill have been honeycombed by men following this class of mining. As to whether or not the whole mass of schists will pay for mining and milling depends wholly upon the value of each claim. Some, perhaps, will not pay to mine as a whole, while others have paid and continue to do so. The Little Gem, about half way between Whisky hill and Table mountain, is a notable example. This has been successfully worked for years, the rock (chlorite schist with some quartz) being crushed in a small mill near the mine run by overshot water wheel.

Table mountain is the name given to an ancient river channel which crosses the lode about three miles north of Quartz mountain. The gravel is covered by a thick flow of black feldspar basalt which has resisted the weathering influences better than any of the other rocks of the vicinity, and, as a result, is a prominent object in the landscape. It runs for miles a nearly flat table with a course generally westward toward the plains of the San Joaquin, though with a more or less sinuous course like that of a great river. It is about half a mile wide. On the north side of the mountain lies a broad, flat, meadow-like tract known as the Rawhide ranch. In this valley, about half a mile distant from the foot of Table mountain, is the Rawhide mine. Here the outcrop of the lode rises from the meadow and presents its usual characteristics for several hundred feet, but soon disappears to the northwestward. At the Rawhide the disposition of quartz lenses in the mass of dolomite is similar to that already described in mines south of it.

The Rawhide, however, possesses one notable feature in which it differs essentially from most others, in that the dolomitic mineral is gold-bearing, and in places to a remarkable degree. In 1893 a rich strike was made in this material, which has been described to me as consisting of a series of short, thin shoots of rich ore. The quartz and chlorite schist are also auriferous in a variable degree. North of the Rawhide the Rappahannock mine has considerable development, and rich quartz is found. It is said that gabbro on the footwall side of what is here considered the lode (the dolomite being absent) is gold-bearing. This statement I cannot substantiate. The Alameda and Tarantula mines, farther to the northward, are essentially similar to the other occurrences described south of Table mountain. The quartz is gold-bearing, and at the Alameda mine, in addition to the usual metallic gold, auriferous pyrite and chalcopyrite, is found auriferous tetrahedrite (gray copper). This mineral also occurs at the Rawhide, at Pinon Blanco in Mariposa county and at a few other localities, and is usually indicative of a good grade of ore.

In all of the region from Mariposa to Carson hill, and including the occurrences of the dolomite at Jackson, Amador county, the green, scaly mariposite is prominent. There are large masses of the carbonate mineral, it is true, in which mariposite is absent, or occurs only sparingly, but it is usually present.

In a number of the mines of this belt in Tuolumne county and on Carson hill in Calaveras county telluride minerals occur, calaverite and petzite being of most frequent occurrence. In the Melones mine on Carson hill is found the rare telluride of nickel—melonite. Native gold usually occurs with the tellurium minerals. W. H. S.

Stage Winding.

At a recent meeting of the South African Association of Engineers, L. I. Seymour opened the discussion on H. W. Miller's paper on the subject of stage winding by remarking that the paper opened up very interesting possibilities for all. Up to the present he did not know of any shafts in contemplation on the Rand, which were more than 5000 feet, but there was no doubt that on the central portion of the Rand especially some very deep shafts would be sunk. Alexander Agassiz, who was here some time ago, said he thought mining could be carried on here to a depth of at least 8000 feet, and possibly more. As to the question of temperature, it appeared that 1° for every 203 feet was about what they found temperature to increase at, and this temperature was very much lower as soon as the connection was made between the shafts, as the natural current of air passed along the drive and through the stopes. These temperatures had been carefully taken with special thermometers. As to the question of when they would begin to operate stage winding he would not like to say, as the Rand had moved so fast in many ways that they could only judge when a new process would take place by existing processes in other places. Describing a visit he had paid to the Calumet & Hecla copper district some four years ago, the speaker said he had found there the Red Jacket shaft, 4400 feet, and it had now been sunk to 4900 feet. The deep-level is known as the Tamarack, and the shaft is now nearly 5000 feet, and is intended to cut the reef at 5400 feet. From there it will pass through the reef, 600 feet, making a total depth of shaft of 6000 feet. The engines for this work are a pair of horizontal engines, having a double conical drum all made in one piece. The diameter of the drum, small part, is 14 feet and the large part 32 feet. The cylinders are 32x84 inches, Corliss valve gear, non-condensing and non-compound. The trip gear is operated by a governor of the usual type. Unfortunately, the steepness of the cone and the width of the drums was so great (the centers of the main bearings being some 27 feet) that the rope slipped down the side of the cone when it was about half way up and worked round the shaft, and, without doing much damage, pulled the engines out of line. The foundations had not been well put in, but that matter had now been remedied, and he believed the engines were working again.

The question of rope was a very important one, and only the best quality of steel was used. The rope is 2½ inches in diameter, and the hoisting speed very great. The Calumet Co. are hoisting in their Red Jacket shaft a load of ten tons of ore from 4900 feet. The rope is also 2½ inches in diameter. The engines are of what is known as the "Whiting System," and are the largest and most complicated he had ever seen for winding. They are triple expansion, having six cylinders and using steam at 185 lbs. pressure, and are condensing. The cost is such as to preclude their use in this country. Proceeding, the speaker said that when it came to a question of winding 6000 feet, some form of double stage winding would have to be adopted. Whether, as the writer of the paper had suggested, they would stop at 3000 feet, he would not like to say. His own impression was that they would go much deeper than that—probably 5000 feet. After that, whether they put in a winding apparatus after they had struck the reef, or before, did not matter very much, as the operation of winding from moderate depths around a turn of 75 to 100 feet radius was not objectionable. The main question was in the strength of the ropes. If "tail" ropes (which were used extensively in England and Germany, and also in Kimberly) were used, the size of the engine could be kept down to a very small point, that was to say, the size of the drums could be made so that they only had to consider the flexure of the rope. But they had to bear in mind at what weight the rope breaks itself. Mr. Catlin had worked it out roughly from the makers' catalogues, and had calculated that the weight of about 60,000 feet of rope would break itself. The Government here required a factor of safety of six to one at all times. Allowing that the rope had become strained, they would need to start with a factor of nine to one. Eight to one would be 7500 feet as a point at which they could not hoist up a skip or any ore. The question of cost varied very much with different managers, as they had to consider what was encountered in sinking, whether the shaft was large or small, whether three, four or five compartments. He believed that stage winding would have to come in for deep levels, and he thought that the possible depths at which second winding would begin would be somewhat later than stated by Mr. Miller in his paper. As to the question of the most economical and best power for the second stage winding, that was a question they would have to fight out later. He believed that the opening up and future working of very deep levels would be by means of inclines sunk through the property immediately above them, especially where those properties could be controlled by one house, or by several houses working in conjunction. In this conjunction, the question of air for deep levels was a serious one, seeing how many men worked below, and this demanded a very large shaft, possibly larger than those now being sunk.

H. Spengel said he thought it would be a long time before they would reach a depth of six or eight thousand feet. He was rather doubtful if Mr. Seymour was right regarding the development at these depths through the vertical shafts of the third row of deep levels, because to reach a depth of six or eight thousand feet from a point which is now, say, even 4000 feet, would mean eventually 4000 feet vertical depth on the incline. Now, the capacity of an incline shaft was comparatively small to the capacity of a vertical shaft, because it was impossible to hoist at any speed similar to that on a vertical. He knew that at home they were hoisting at a normal speed, something like 3000 feet. —South African Mining Journal.

In the States of California and Washington aluminum wire has been utilized for carrying electrical current, but, viewed in its entirety, the electrical world does not seem prepared to reject copper for the lighter metal. The cost and limited output of aluminum seems to render it immediately unable to compete with copper, the use of which is evidently sure to increase.

The Occurrence of Roscoelite in California.

By H. W. TURNER, in American Journal of Science.

According to H. G. Hanks, at one time State Mineralogist of California, attention was first called to roscoelite by Dr. James Blake at a meeting of the San Francisco Microscopical Society, July 2, 1874. The specimens then exhibited were from the Stockslager mine, which is about one kilometer southwesterly from Lotus, on Granite creek, El Dorado Co., Cal.

At a meeting of the California Academy of Sciences held July 20, 1874, Dr. Blake presented specimens of the same mineral, which he then supposed to be a chromium mica.

At a meeting of the California Academy held August 2, 1875, Dr. Blake read a paper on roscoelite. Samples sent by him to Dr. Genth of Philadelphia were found to contain vanadium. The mineral was named by Blake in honor of Prof. Roscoe of Manchester, Eng., who had made vanadium a special study. Dr. Blake calls attention to the fact that Dr. Hall found vanadium widely diffused in many rocks, generally associated with phosphorus. According to Hanks, the Stockslager vein from which the roscoelite obtained by Dr. Blake was taken, is small and not continuous, varying from 2 inches to a foot in thickness and running nearly parallel with Granite creek. Associated with the quartz is calcite, and there are at least two varieties of iron sulphide present, probably pyrite and chalcopyrite. Hanks states further that the gold occurs only with the roscoelite and is found interstratified with the roscoelite laminæ in pieces from the value of $1 to the minutest microscopic particles. He also states that from 400 to 500 pounds of roscoelite were obtained by the miners, all of which was wasted in extracting the gold.

George W. Kimble of Placerville, Cal., for many years county surveyor, has furnished the California material analyzed by Dr. Hillebrand as well as other specimens. In these specimens the roscoelite is in part embedded in quartz and probably contemporaneous in formation with the quartz, and in part fills little cracks in the quartz and, therefore, somewhat later.

There are given below four localities where roscoelite has been found, according to Mr. Kimble, to whom the author is indebted for the following information about the occurrence of the mineral at these localities.

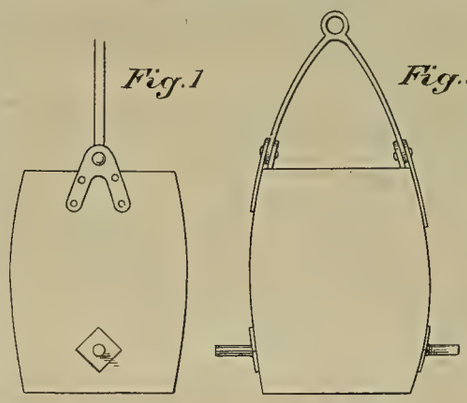
The Calaveras formation is largely of Carboniferous age, as may also be the augite-porphyrite tuff associated with it. The serpentine is later than the Calaveras formation and earlier than the granodiorite, which is probably late Jurassic or early Cretaceous. It will be observed that all of the localities are at or near the contact of an intrusive granodiorite mass with the surrounding rocks, chiefly sediments and old lavas. This suggests that the mineral may be regarded as in some way due to the mineralizing solutions accompanying the intrusion of the granodiorite. However, the quartz veins clearly fill fractures which formed in the granodiorite and associated rocks after the consolidation of the granodiorite; consequently, the deposition of the quartz and the associated gold and roscoelite must have been also subsequent to the consolidation of the granodiorite. The following are the localities reported by Mr. Kimble. They are all in El Dorado county, from eight to fifteen kilometers northwest of Placerville:

Locality 1.—Thompson hill on its northeast slope about 2.5 kilometers southeast of the Stockslager mine: There are here fifteen or more small seams of quartz having a strike of north of west. As these seams pass through the contact with the granodiorite (augite-porphyrite ?) they contain rich spots of gold and roscoelite. The seams of quartz pass on through the northeast point of Thompson hill and come into the granodiorite again.

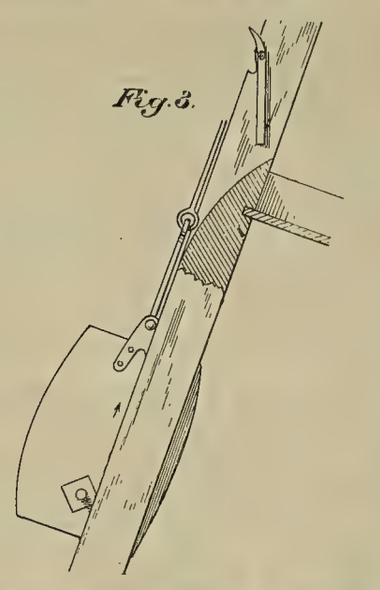
Locality 2.—Stockslager mine on Granite creek: Mr. Lindgren informs me that the vein of the Stockslager mine is in a narrow wedge of metamorphic sediments of the Calaveras formation. Immediately east of this wedge is granodiorite, and immediately west is serpentine. Mr. Kimble states that there is here but one vein of quartz. This passes from the granodiorite into the narrow wedge of the Calaveras formation. It does not penetrate the serpentine. As previously stated, it was at this locality that by far the larger part of the roscoelite was obtained, including that analyzed by Dr. Hillebrand.

Locality 3.—South slope of spur about 2.7 kilometers north of the village of Lotus: In micaceous slate, which is part of a contact metamorphic zone of the Calaveras formation. The exact locality is about 500 feet east of the contact. It has never been demonstrated, but Mr. Kimble thinks that this quartz vein extends southeast into the granodiorite.

Locality 4.—Clark mountain on its east slope at the contact of the Calaveras formation and the granodiorite: The occurrence here is identical with that at the Stockslager mine.

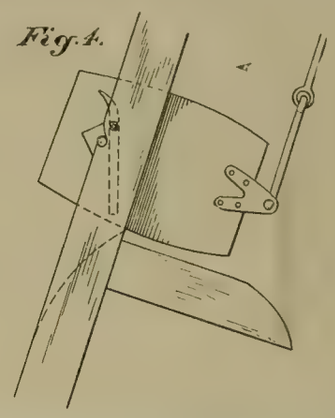


According to Kimble, no roscoelite has ever been found where the seams are in granodiorite, and the latter is not altered; but some has been found at the contact of the quartz with serpentine in localities 2 and 4. All of the quartz seams at localities 1, 2 and 4 dip southwest and have pockets of gold.



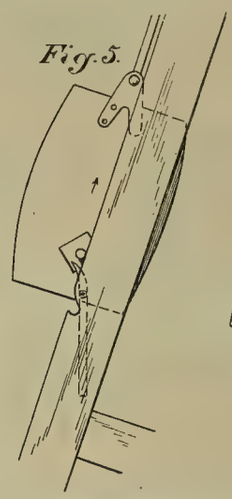
Prof. Hanks states that roscoelite was also found in Sec. 31, T. 11 N., Range 10 E., two miles from the Stockslager mine. This appears to be the Thompson hill locality of Kimble, to whom, indeed, Prof. Hanks was probably indebted for his information. Hanks states that the roscoelite was found here in the bedrock of the Big Red ravine in a dark colored micaceous rock in small seams of quartz with calcite and gold.

The roscoelite from California shows a tendency to crystallize in little rosettes, so that individual scales of any size with the same optical orientation throughout are difficult to obtain. Some scales gave with convergent light a nearly uniaxial black cross, the hyperbolas opening but slightly on rotation, indicating a small axial angle. Like all other micas, it is optically negative. The pleochroism as seen in thin foils is: *c* and *b* clove brown to greenish yellow brown, *a* light greenish yellow. In the scales of the powder analyzed no rutile needles or other inclusions were detected, but in the center of a rosette of roscoelite scales were found dark grains with a metallic luster. These grains are of sufficient size to have fallen with the heavy minerals during the process of separation with the Thoulet solution, and it is not likely that any of them have been included in the powder analyzed, although they were noted in the impure material before it had undergone the final separation. The grains show no crystal form and were not determined.



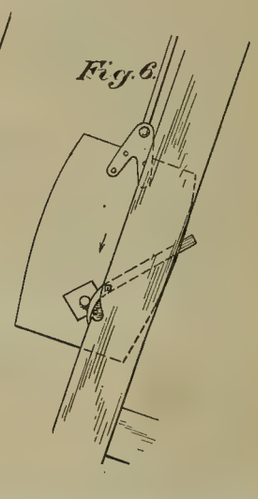
A Self-Dumping Bucket.

That a bucket which can be dumped without the aid of a topman is a desirable thing every miner knows. Various ingenious contrivances of this character have been introduced from time to time, some of which are fairly successful, and others much less so. In British Columbia a self-dumping bucket has been in use at various mines in inclined shafts, and has been employed long enough to determine its value. To Mr. F. S. Robbins, E. M., of Greenwood, B. C., the MINING AND SCIENTIFIC PRESS is indebted for a series of drawings which completely illustrate the operation of this ingenious and economical device. Figs. 1 and 2 show the form and construction



of the bucket, which is provided with substantial lugs projecting from the sides of the bucket, and at a point considerably below its center. Fig. 3 shows bucket, ascending or descending, riding the skids with the lug free. The shaded portion of the skids (Fig. 3) indicates where the inner side of the skid is cut away to allow the bucket to gradually sink low enough for the lug to run upon the rail without a sudden drop. As the bucket ascends and reaches the point thus cut out the bucket sinks between the skids and the lug drops into the notch cut for it. The engineer slacks the rope and the bucket tips by gravity and dumps into a chute, car or bin beneath, as shown in Fig. 4. Having discharged its contents,

the engineer hoists the bucket; the lug rides upon the rail, passes the latch (as in Fig. 5), and is again lowered, the lug being carried over the notch by the pendulum latch, as shown in Fig. 6.



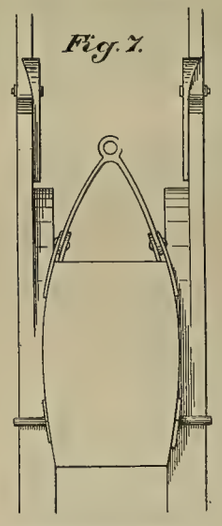


Fig. 7 illustrates a front view of the bucket and runway, showing the half section cut out on the dotted lines shown in Figs. 3 and 4.

There are many shafts where a device of this character may be employed, particularly about prospects and small mines, where it is desirable to work as economically as possible.

THERE is an increasing tendency to introduce auxiliary machinery in mills and mines for special work. These machines are operated usually by electricity or compressed air. Mechanical haulage is also being introduced in large mines, it having been demonstrated that where large amounts of ore or other material has to be transported underground, it is cheaper to do it by electricity, compressed air or rope haulage, than by the old methods of teaming with men or animals.

Mines of the Frontino and Bolivia Company, Colombia, S. A.*

By FRANK OWEN, El Peru, Venezuela.

While the labor in the part of Colombia where these mines are situated is far inferior to that of white miners, it is nevertheless decidedly superior to that available in other parts of the republic, and in the northern mining regions of South America generally. The Antioquenos have been miners for several generations, and many of those employed at the Frontino Company's works have been brought up at the mines, which is a distinct advantage. The ground encountered in the surface workings of that district being very treacherous, they are skillful timbermen, every miner being able to put in his own timber in tunnels, stopes, etc., so that, except for the main shafts, where sawn timber is used, special timbermen are not required. In the shallow workings it is the custom for the miner to come out of the mine in the thickly wooded bush and select and cut the timber he requires, which he will then take into the mine and put in place. That they are not inferior miners is shown by their being capable of overhand stoping, to which the West Indian negroes in the mines of Venezuelan Guyana are trained only with considerable difficulty—though the latter are paid in gold coin and not in depreciated paper. A miner's wages to-day in this district are $2.25 Venezuelan (equivalent to $1.80 U. S), while ten years or so ago, in the palmy days of El Callao, they ran as high as $5 Venezuelan ($4 U. S.).

The rapid decay of timber in the mines is, I think, attributable not to inferior quality, but rather to the hot and damp atmosphere to which it is exposed. The hard-wood timbers of the northern part of South America are indeed noted, even in Europe, for their strength and durability—for instance, green heart, purple heart, locust wood and bullet wood, "balata" (a kind of India rubber), etc. Green-heart timber from Demerara was used for the lock gates on the Manchester canal.

Amalgamation by plates inside the battery would be, I believe, a great improvement at Frontino, such free gold as is met with in the ore being mostly coarse. I remember that in cleaning up the mortar boxes it was no uncommon thing to come across small nuggets, weighing up to 1 dwt.

Transport in Antioquia is slow and expensive, as it is necessarily accomplished entirely on mule back, owing to the mountainous nature of the country; and the roads are always bad, on account of the very damp climate. It is, however, far cheaper, and even in many cases more expeditious, than in this part of Venezuela, where the roads are much more level and the climate is drier, so that bullock wagons and mule carts are in use. Freight from the port of Las Tablas on the Orinoco to El Callao now averages about 3 cents (U. S.), and was formerly as high as 12 and even 15 cents per pound.

It is indeed surprising that hitherto so little attention has been paid in Europe to the development of the undeniably great mineral resources of Colombia. General Marceliano Velez, a Colombian politician of some note, and at one time a candidate for the presidency, has written of the "forests absolutely unexplored, filled with unheard-of wealth, but left in isolation and solitude as complete as if they were shut off from the world, like the regions of central Africa." M. Moulle, a French mining engineer of repute, in a report published in Paris in 1887, says:

"Antioquia is undoubtedly one of the countries in the world where gold deposits of all kinds are to be met with in the greatest profusion. If, thus far, her immense wealth has not attracted the attention of Europe, this is principally due to her position in the center of Colombia, a country which, until the last few years, was, so to say, completely unknown to the European public. After traveling through Antioquia for many months in search of information, I believe I may say that, with some exceptions, the gold beds have barely been worked superficially, and, from the point of view of modern mining industry, they may still be regarded as virgin deposits."

G. Jenner, at that time British Minister to Colombia, wrote in 1894:

"Under the Spanish dominion the gold fields of Colombia were admittedly the richest in the world, and down to the year 1848 they furnished fully one-third of the whole supply of American gold. It is well known that the Spaniards worked the mines in a most primitive manner, and that the gold they extracted was almost entirely derived from the surface of vein or alluvial mines and from washing the sands of the rivers. * * * If this be the case, it can scarcely be denied that with scientific prospecting—of which the Spaniards hardly knew anything—and with scientific appliances, the amount of gold that is still to be gathered from the Colombian soil must be infinitely greater than that which was dug up during the Spanish occupation. The one advantage the Spaniards possessed was cheap labor. For nearly two centuries they obtained gold and silver in return for the lives of Indians, from whom labor was exacted in so unmerciful a manner that, though none of the mines were worked by deep shafts, so great was the mortality among the Indians that whole districts were depopulated, and many mines abandoned on that account alone. * * * Others were abandoned owing to the inroads of the natives, and many more because the Spanish miners were incapable of overcoming difficulties that would offer no serious obstacle to the mining engineers of the present day. Of the richest mines known to the Spaniards many, therefore, remain practically untouched; and it is by no means improbable that careful surveys would lead to the discovery of others of at least equal wealth."

* Condensed from Transactions American Institute Mining Engineers.

Corundum in California.

TO THE EDITOR:—The dearth of well-developed crystallized minerals in the rocks of the central gold belt of the Sierra Nevada has long been noted by mineralogists as well as miners, and no single mineral has so far been less in evidence than corundum. This is the more remarkable when we consider the great belts of serpentine which occur all through the central gold belt, often related structurally to the serpentines of North Carolina, although with us this rock seems chiefly derived from pyroxenites, while the North Carolina serpentines have been recognized as peridotites.

North Carolina has for some decades been noted for its wealth in corundum, even in its purest forms, and from its corundum mines many notable gems have found their way to the centers of commerce and the principal mineralogical collections.

So far I have found no notice of corundum in California, except a doubtful occurrence in Los Angeles county, quoted in the Mining Bureau reports.

During recent studies of the great serpentine belt of Plumas county the writer was fortunate enough to find a deposit of corundum, which may prove to be economically valuable. The deposit is found on the edge of a great pipe or dike of felsitic porphyry, which sets up through the serpentine. Crystals of corundum lie scattered through a white feldspar, which, however, has not yet been determined, and may prove to contain aluminates. The feldspar lies imbedded in a greenish clay, itself an alteration product of margarite, which also penetrates the feldspar, and occasionally the corundum crystals, which are gray or nearly white where much weathered. In the larger crystals zones of the corundum are noted, generally parallel with the faces of the prism or the pyramid, in which latter habitus the larger crystals generally appear. The largest crystal yet found is 2½ inches long, with an average diameter of ¾ inch.

All the specimens so far obtained have been taken from near the surface, but further explorations will be made to determine the extent and value of the deposit. The locality is near Meadow Valley, Plumas county.

Typical specimens of the corundum and its gangue rock have been donated to the Mining Bureau, where they can be seen by the public. J. A. EDMAN.

Number and Area of the Philippine Islands.

Prof. George Davidson of San Francisco has called the attention of the Geographical Society of the Pacific to manifest errors in the United States official documents relating to the Philippines. The number of the islands is far less than is generally supposed, while their area is underestimated. Following is the letter:

In several Government documents the statement is made that the area of the Philippine Islands is something over 114,000 square miles. In the latest one, just received, it is given as 114,326 square miles. This error has doubtless arisen from a hurried examination of the Spanish documents. We find in the "Guia Official de las Islas Filipinas, para 1898, Publicada por la Secretaria del Gobierno General, Manila, 1898," the statement that the archipelago comprises an area of 355,000 square kilometers, without including the Jolo (Sulu) group. It then specifies about thirty-five of the principal islands, and their areas aggregate 298,485 square kilometers. That, of course, leaves a multitude of the smaller islands not specified in the guide, but covered by the larger area. With the relation of one square kilometer equal to one square mile multiplied by 0.386052, the area of the islands specified amounts to 115,238 square miles; and the area of all the islands, less the Jolo group, amounts to 137,057 square miles.

Further, the statement is generally made that the archipelago of the Philippines contains from 1000 to 2000 islands, and the "Guia Official" says the number is more than 1200. But in examining the "Derrotero del Archipelago Filipino, Madrid, 1879"—that is, the Coast Pilot of the Philippines, covering more than 1200 pages—we find that the islas, islitas, isletas, islotes, islotillos and farallones therein described amount to 583. Of course, this does not include reefs, rocks or hidden dangers.

I submit that these figures of the area and of the number of islands and islets be accepted by the society until replaced by Government surveys.

GEORGE DAVIDSON.

An Experiment in Cyanide Poisoning.

By A. MCARTHUR JOHNSON.

At a recent meeting of the South African Chemical and Metalurgical Society, the author read a paper on peroxide of hydrogen as an antidote for cyanide poisoning, which will be interesting to cyanide men everywhere, as non-medical men can resort to this method at a moment's notice. His remarks were in part as follows:

In order to confirm, or in most part dispel, doubts, Mr. Rand of the Simmer and Jack works and myself procured the necessary apparatus:—a solution of hydrogen peroxide (obtained from a Johannesburg chemist), a hypodermic syringe, capable of containing one cubic centimeter, and the necessary animal organism, in this case, a dog, to all appearances in first rate condition. This solution of peroxide of hydrogen was diluted to 2.5 times its strength, a trifle more, perhaps, than necessary, but we were determined not to stick at trifles. The first attempt to make the dog a martyr to science was useless, as he, as dogs will, refused to swallow the cyanide. However, about 300 cubic centimeters of cyanide solution was taken from the reservoirs and when tested was found to be of 0.1% strength. The potassium cyanide contained was thus about 0.3 grammes and sufficient to kill a full-grown man. This solution was taken because it was desired to bring the experiment as nearly allied as possible to probable contingencies. This, after some difficulty, was completely partaken of by the dog, scarcely a drop being wasted. When immediately released the dog stood up, but gradually sank and within a few seconds was stretched out and breathing with the greatest difficulty. The syringe, charged with peroxide of hydrogen solution, was then produced and tried but, unfortunately, the first needle broke owing to the thickness and toughness of the skin. Hastily fixing another needle and making a small incision in the abdomen with a penknife, the solution was successfully injected, fully one and one-half minutes having elapsed between the drinking of the solution and the first injection. By now the animal was to all appearances lifeless, its body stiff and the legs stretched out, while it seemed unable to get a breath of air, trying to gasp and unable to do so. The peroxide was, however, perseveringly injected at intervals of, roughly, about two and one-half minutes, and this was continued for nearly an hour. During this time the animal lay with mouth wide open and tongue lolling out, while the gasps, when they occurred, were prodigious, the lungs expanding fully a couple of inches beyond the usual and being depressed to almost a shadow-like shape. Twice, to all appearances, the respiration had ceased, and it was only by applying the ear that the faintest possible sigh could be detected. This showed that the third and last stage of cyanide poisoning symptoms had been reached by the animal. Thus encouraged, the injection was continued and at the end of three-quarters of an hour the animal began to show signs of returning consciousness and will power. The tongue was gradually withdrawn and the head began to move. The difficulty in respiration continued for some considerable time, but gradually the body began to assume its usual appearance, although the teeth were now and for some time on tightly clenched. The last injection seemed to congregate just where it entered and took a short time before being absorbed by the blood, whereas the previous ones had almost instantaneously disappeared. Arguing from this and from the general appearance and condition of the animal, we desisted and let the dog come to itself. This it gradually did, and at the end of one and one-half hours after drinking the cyanide it was able to stagger up and move away, though very unsteadily. The eyes seemed dazed while the mental equilibrium was wanting, as its movements were very erratic at first. Considering this, we tied it up and offered it water, but this it absolutely refused to drink. In all about thirty injections were made—about 30 cubic centimeters. I learn that, curiously enough, the animal was exceedingly skittish the following day, and latest reports show that, if anything, the experience has left it better than before.

Unfortunately, for the sake of an accurate description of the various symptoms, I had no intention of bringing up this matter before the society, or you could have had a more complete statement; but from the facts I have stated I hope you will agree with me that a practical prevention against cyanide poisoning can be placed in the hands of all men on cyanide works. Should any case of such poisoning occur, I am confident it can be counteracted if the proper restoratives be applied in time, that is—I quote Kobert as authority—before visible evidences of animation have ceased to show, or even one or two minutes thereafter. This latter peculiarity, the same authority remarks, is due to the fact that in cases of poisoning by weak solutions the heart is the last organ to be affected by paralysis. Of course, with excessively strong cyanide solutions, the paralysis, and therefore death, is practically instantaneous.—Journal Chemical and Metallurgical Society, S. A.

Industrial Notes.

—Los Angeles, Cal., will issue $2,000,000 municipal water bonds.

—California's school population is officially reported to be at a standstill.

—The Pacific Coast Telephone Co. has 54,330 subscribers, the Central Union 52,745.

—Seattle, Wash., is to have a permanent exhibit of the mineral resources of that State.

—The Chilcoot tramway over Chilcoot pass has been sold to the White Pass and Yukon Railroad.

—The Floriston, Cal., Paper Co. wants to furnish electric power to the Comstock, Nev., and offers 5000 H. P. at $5 H. P.

—The Kern River, Cal., Power Co. will build a reservoir, erect a power house at Kernville, and construct an electric line thence to Los Angeles.

—The usual railroad rumors now take the form of alleged consolidation of the Pennsylvania and Santa Fe to form a great transcontinental system from the East clear through to San Francisco.

—The Fresno, Cal., oil strikes are considered by the Union Oil & Transportation Co. to be of sufficient importance to justify organization with intent to lay a 6-in. pipe line from Panoche to the San Joaquin river.

—The Gold Belt Electric Co., Cripple Creek, Colo., proposes to furnish power, light and heat in the Cripple Creek mining district; capital stock $300,000. E. B. Moffat is said to be the financial backer of the new company.

—Labor Commissioner Smith of Colorado says he considers the eight-hour law just and favors compulsory arbitration. He says that on the average 25% of the laboring people of Colorado were idle half the time and that higher wages were paid there than in any other State.

—W. L. Woodward of the Randsburg, Cal., Railway Co. has returned to Los Angeles from New York and states that he has secured capital for the building of a short line of railway from Flagstaff, Ariz., to the Grand Canyon of the Colorado—a distance of thirty-five miles.

—Denver, Colo., hears that the Union Pacific has decided to make its Omaha-Ogden line a double-track road to meet the demands of business. The first section of additional track is to be built between Cheyenne, Wyoming, and Laramie over the Sherman mountain—fifty-six miles.

—The Northwestern railroad is building down the Snake river, near Huntington, Or. About 700 men are at work. The road is to be 73 miles long, down the Oregon side of the river, and will terminate at Tramway Junction, to which point an aerial tramway is projected from the Peacock mine.

—Marconi's system of wireless telegraphy is to be put in operation in Hawaii as a means of communication between the different islands of the group. An organization has been formed, capital has been subscribed for the project, and some of the material of the system is already on the way.

—W. S. Stratton and W. H. Colburn have organized the St. Anthony Crystal Mica Co., and it is stated have invested $250,000 in mica properties, 100 miles south of Santa Fe, New Mexico. The product of the mines is to be shipped to Colorado Springs, where a plant will prepare the mica for market.

—The Eastern Oregon Power Co., Baker City, Or., will furnish power to the mines around Baker City; capital stock, $100,000. Among the incorporators are A. Geiser, manager of the Bonanza mine; F. S. Baillee, manager of the Columbia mine and J. T. English, manager of the Golconda mine.

—Immigration arrivals at San Francisco during the year ending June 30th, '99, were 4766—3726 males, 1040 females: Japan 1667, England 1464, Germany 201. Mexico 153, Portugal 138, Ireland 150, Spain 72, Corea 22, Phillippine islands 11. The money brought by these various immigrants was $333,754.

—A City of Mexico report is that Popocatapetl volcano has been sold for $600,000 in gold to General Gesper Sanchez, who for some time owned and operated the sulphur deposits in the crater of the volcano. A cogwheel railroad will be built to the summit and the sulphur deposits mined on more extensive scale.

—A new steel shaft just finished for the Boston Elevated Railway Co. is said to be the largest ever cast. It is to be used in the company's central power station. The engine will be of 4000 H. P. at ordinary speed. The shaft is 28 feet in length and 38 inches in diameter in the center and weighs about 75,000 pounds.

—Omaha, Neb., reports that, as a result of the closing of a number of furnaces of the Omaha & Grant smelter, 1000 men are idle, and the indications are that other furnaces will be closed and other men forced to remain idle. The management gives as an explanation their inability to secure coal as usual from the Illinois and Iowa mines, because of the labor troubles there. When asked why they did not utilize coal mined on the Union Pacific, the manager declared this class of coal was too costly, and that the plant could not be profitably operated with Rock Springs coal.

—Precious stones to the value of $160,290 were found in the United States in '98, as compared with $136,675 in '97. G. F. Kunz, the agent for the Geological Survey, in charge of the collection of data relative to the production of precious stones in this country, deals at length in his annual report with the finding of rock crystal at Mokelumne Hill, Cal., of such purity and size as to rival the Japanese; the successful cutting of these in the United States up to over 7 inches in diameter; the increased output of the Fergus county, Montana, sapphire mines; the yielding of fine blue gems up to two karats each, and the discovery of a new locality where the stones are more varied in color than those heretofore found; the continued output of the New Mexico turquoise mines and the opening up of mines in Nevada; the finding of magnificent green and other tourmalines at Paris Hill, Me., and Haddam Neck, Conn.; the increased sale of the Australian opal; the greater importation of uncut diamonds and the increase of the diamond cutting industry in the United States; the unprecedented increase in the importation of cut diamonds and the revival of the precious stone industry in the United States.

—Chicago reports the development of a rival to the elevator trust. The Frazer Electric Elevator Co., a San Francisco concern that has been operating with a capital of $2,000,000, is invading the territory hitherto monopolized by the Otis Elevator Co. The Frazer corporation, it is understood, will increase its capitalization and extend its facilities in general. G. Crocker, the vice-president of the Southern Pacific, is president of the California concern. J. J. Mahoney is vice-president and general manager. W. H. Coon, formerly the manager of the Crane Brothers' Elevator Co., is the Eastern representative of the Frazer Co.

—An Eastern electrical paper estimates that the waterfalls in California alone have over 240,000 H. P., and that about 45,000 of this H. P. has already been converted into electrical energy and sent to Los Angeles, Sacramento, Fresno, Pomona, Redlands, Folsom and San Diego for lighting and motive purposes. Five more electric companies will have their long distance transmission systems in working order by next September. About 50,000 more H. P. will be developed by them for use in California and Oregon, while still other companies are beginning work on electric power plants that will cost from $100,000 to $500,000 each, and will harness more mountain streams for electrical transmission of their power to distant towns.

Personal.

B. I. WHEELER has accepted the presidency of the University of California.

WM. VAN SLOOTEN has returned to New York City from a professional visit to Mexico.

D. E. BIGELOW of the Union Iron Works has returned to San Francisco from Redding, Cal.

W. A. CLARK says that none of his Montana or Arizona copper properties are in the combine.

J. H. TIBBITS of Redding, Cal., is consulting engineer for a large Nova Scotia mining company.

E. H. COOKE, Supt. United Globe Mines, Globe, Arizona, has returned from El Paso, Texas.

W. A. FARISH is in Salt Lake City, preparing his report on some mining properties recently examined.

ALFRED VON ROPP, Supt. Selby Smelting & Lead Works, Selby, Cal., has returned from a brief Eastern visit.

RICHARD A. PARKER has changed his San Francisco office from the Crocker Bldg. to room 15, 320 Sansome St.

LUCIAN EAVES, consulting engineer for the Idaho Exploration & Copper Co., is exploring the Seven Devils country.

H. H. HENLEY, representing the Vulcan Iron Works of San Francisco, has returned from a business trip to Arizona.

H. KNIPPENBERG, Gen. Mgr. and Pres. Hecla Con. M. Co., will resign September 1 and remove to Indianapolis, Ind.

W. F. ROBERTSON, British Columbia provincial mineralogist, is shipping British Columbia mineral specimens to Ottawa, for the Paris Exposition.

H. E. PICKETT of El Dorado county, Cal., was in San Francisco last week, attending an executive meeting of the California State Miners' Association.

IT is reported that M. J. Flynn, formerly a Supt. at Mercur, Utah, and now Mgr. Boulder Perseverance, in Western Australia, will return to the United States.

W. F. PATRICK, formerly Supt. at the South Eureka, Tintic, Utah, is now Mgr. Osceola mine at Osceola, Nevada. He has recently returned from an Eastern trip.

THEO. F. VAN WAGENEN, E. M., formerly identified with mining in Colorado, has opened an office in Boise, Idaho, for the practice of general mining engineering.

F. R. MILES, formerly of Butte, Mont., who claims to be a couisin of Gen. N. A. Miles, is the Klondike's World's Fair Commissioner, appointed by Gov. Ogilvie of the Yukon district.

L. T. WRIGHT, Mgr. Keswick, Cal., Mountain Copper Co., favors reception there to the 100 delegates on their way to San Francisco to the meeting of the American Institute Mining Engineers.

HEBER HOLMAN succeeds the late P. Kervin as Supt. Best & Belcher and Gould & Curry M. Companies. J. R. Ryan succeeds Mr. Kervin in the superintendency of the Con. Cal. & Va. mine, Virginia, Nev.

R. B. BROWN of California, the mining engineer who was awarded $1,812,000 by the Boer Chief Justice in his claim against the Transvaal government, wants the United States to intervene and collect the amount for him.

WM. MCGILLIVRAY, under date of Jan. 2nd, writes from Kowak river, Alaska, north latitude 67°, that there is little or no gold in that country. Regarding his brother, John D. McGillivray, who many California readers of the MINING AND SCIENTIFIC PRESS will remember, Wm. McGillivray writes: "My brother, John D., has three good claims on Sulphur creek, worth from $30,000 to $40,000."

VICTOR C. HEIKES, the honorary special agent, Department of Mines and Metallurgy for the U. S. Commission to the Paris Exposition, is in San Francisco arranging for the display of the mineral resources of California, and is pleased with the interest taken by the California Commission in making an effort to be well represented at Paris. Mr. Heikes states that the large number of useful commercial minerals which California has, when shown in the United States space under exposition classification, will look very much like a California State exhibit. The space allowed the California Paris Exposition Commission in the Mining Department is practically one-fourth of the whole allotment for the United States representation in ores and minerals.

Commercial Paragraphs.

THERE will be a national export exposition of American manufactures at Philadelphia from Sept. 14th to Nov. 30th, '99. The Union Iron Works of San Francisco will make an exhibit entirely of pictures representative of its ship-building yard. There will be eighteen views in all, each of them occupying 4 square feet. All but three will be pictures of ships, and of those three two will be views of the Wisconsin's engines and the other will show the engines of the Chitose.

IMPROVEMENTS in the Wilfley table occasions a saving of values in the tailings. The feed box is now attached to the table itself, the motion of the table facilitating and regulating the discharge. The wooden launder is replaced with 1¼-inch pipe, having perforations in the upper side, the pipe being stationary. After these changes were made one table in a three months' run at Butte, Mont., is said to have saved 872,882 pounds of material that formerly went to waste, containing 61,627 pounds of fine copper and 3543 ounces of silver.

THE Montana & Denver Reduction Co., through its Gen. Mgr., Arthur B. Brown, has placed the order for their combination mill with the Edward P. Allis Co. at its Denver office. This will be a custom mill, with a sampling mill, twenty 850-pound stamps, copper plates, followed by concentration and cyanide. This mill is to be erected near Coloma, Mont. Frank B. Turner has also placed the order for the machinery for a fifty-ton cyanide mill with the same company at Denver. This mill is for the Nevada & Utah Exploration M. Co., at Norris, Mont. The Allis Co. are also getting out the machinery for a large concentrating mill, to handle the Enterprise dump material at Rico, Colo.

ELECTRICITY is being largely used in gold mining. The Westinghouse Electric & Mfg. Co. are constructing a considerable number of electric generators and motors for operating mines in Colorado and California. The Cripple Creek district secures electric current from points thirty and forty miles distant, using it at the gold mines for hoisting, pumping and ore reduction purposes. The Western States have erected a number of electric generating stations, utilizing waterfalls for motive power, from which electric current is widely distributed. The Santa Ysabel G. M. Co., Quartz, California, is installing a 200 kilowatt Westinghouse generator, and a 200 kilowatt Westinghouse rotary converter, with switchboard and a complete electrical outfit. A large Westinghouse Type "C" motor will be supplied to haul the rough ore to the surface. These motors are virtually automatic and never get out of order, as their construction is of the simplest type. Many hundreds of these Westinghouse motors are in use in Cripple Creek district for hoisting and pumping. The El Paso Electric Co., Colorado Springs, are installing a 180 kilowatt Westinghouse generator. The Pioneer G. M. Co., whose head office is at Boston, Mass., are putting in a 100 H. P. Westinghouse Type "C" motor for working the mine hoist. A new feature is the application of electricity to dredgers, which are used for obtaining gold from river beds. These dredging operations are usually in places where coal is a scarce and costly commodity, which has to be transported by teams to the river bank, over the worst of roads, and then lightered to the dredgers. It has been found far more economical to carry a copper wire from the river bank to operate electric motors, which readily perform every operation on board the dredgers. The Continental Gold Dredging Co. of California, are having a large dredger built at Milwaukee, Wis., which will be equipped with several Westinghouse Type "C" motors, one of 100 H. P., another of 75 H. P., besides smaller ones. The electric power to operate the motors will be obtained from the Yuba Power Co., Cal. The dredger will operate upon the alluvial deposits on the foreshores and banks of the Yuba river.

Catalogues Received.

UNION GAS ENGINE CO., San Francisco, Catalogue No. 12. Whoever got up this catalogue understands his business. It is a model, 36 pp., very little talk, fine paper, good engravings, with just enough accompanying description to indicate what the picture represents, and what it is claimed it will do. Pictures of engines from 3½ to 130 H. P. are given, with the specifications as to weight, floor space required, style of fittings, for what use designed, etc. Any one on land or water interested can get the catalogue by asking the Union Gas Engine Co., San Francisco, Cal., for it.

Obituary.

F. M. ENDLICH, mining engineer, killed himself at Tucson, Arizona, on the 17th. He had been manager of the Saginaw M. Co., and had just been engaged as manager of the Martinique M. Co.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 11, 1899.

628,597.—ELECTRIC ELEVATOR ALARM—H. R. Bruhns, S. F.
628,763—VEGETABLE CUTTER—E. T. Clowe, Woodland, Cal.
628,697.—CONCENTRATOR—Couls & Dohlgreen, Tacoma, Wash.
628,698—MAKING PRESS COPIES—L. D. Craig, Tacoma, Wash.
628,781.—DRILL—Farrington & Copeland, Phœnix, Ariz.
628,600.—COMPASS AND COURSE CORRECTOR—J. M. Fields, S. F.
628,601.—SKIRT SUPPORT—W. Fraser, Oakland, Cal.
628,580—CURLING IRON—B. Gray, Los Angeles, Cal.
628,906—ROTARY PUMP—J. Grindrod, Los Angeles, Cal.
628,625.—SAW FILER—S. W. Gutridge, Granite, Or.
628,540.—BUCKLE—H. C. Keeler, Waterville, Wash.
628,909.—SHADE CUTTER—E. Litten, Santa Ana, Cal.
628,586.—AIR COUPLING HANGER—J. C. Look, Tudor, Cal.
628,183.—SHEARS—F. Macri, Huntington, Or.
628,671.—VALVE—G. O. Newman, Riverside, Cal.
628,605.—HATHOLDER FOR CHAIRS—F. R. Ottenheimer, S. F.
628,606.—STEAM GENERATOR—J. C. Parker, S. F.
628,895.—TAX COMPUTER—W. F. Parker, San Jose, Cal.
628,590.—HORSESHOE—W. E. Shaw, S. F.
628,615.—ERASER CLEANER—J. L. Smith, Riverside, Cal.
628,866.—FRUIT GRADER, ETC.—F. M. Starrett, Silverton, Or.
31,213.—DESIGN PHOTO MOUNT—P. J. Stuparich, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC ELEVATOR ALARM.—H. R. Bruhns, San Francisco, Cal. No. 628,597. Dated July 11, 1899. The object of this invention is to provide a means for signaling the approach of elevator cages to different floors or points of danger. It consists of a series of independent signals, each having a circuit closing device and an electrical circuit, a spring projecting into the path of the elevator so as to remain depressed during the passage of the elevator past it, a fulcrumed lever and a push bar connecting one end with the spring, a push button actuated by the opposite end of the lever to close the circuit and a means for compensating for irregularities of movement of the lever and push bar.

HAT HOLDING ATTACHMENT FOR CHAIRS.—F. R. Ottenheimer, San Francisco, Cal. No. 628,605. Dated July 11, 1899. This invention is designed to provide a safe receptacle for ladies' hats, and is employed as an attachment for theater chairs or seats in public places in which ladies usually remove their hats. It consists of a collapsible case fitted to the bottom of the seat and closable against the bottom of the seat when not in use, so that when the seats are turned up it does not project to interfere with the passing of people. When in use, it is extended and the hat is placed in it, and it then depends below the bottom of the seat and forms a sufficient protection for the hat.

WAIST AND SKIRT ATTACHMENT AND SUPPORT.—Wm. Fraser, Oakland, Cal. No. 628,601. Dated July 11, 1899. This invention is designed for the support of ladies' skirts and to form a connection therewith for shirt waists and similar upper garments. It consists of an attachment to be applied to the belt or band of the skirt, and provided with hooks which engage the belt attachment, and also to engage with the tape of attachment upon the band of the waist so as to keep the latter in position and maintain the junction of the two garments. The device comprises a plurality of bent plates attached to the skirt having outwardly and inwardly presented hooks. Loops or attachments are fixed upon the lower part of the waist, and with these the inner hooks of the skirt attachment engage.

COMPASS AND COURSE CORRECTER.—J. M. Fields, San Francisco, Cal. No. 628,600. Dated July 11, 1899. This invention is designed for the correction of errors in the course of vessels, such as may arise where iron and steel enter largely into the construction, or on account of the character of the cargo or from other causes. It consists of a suspended ring or structure, an outer ring fitting and adjustable therein having its surface graduated in degrees each way from zero, a dial concentric with the ring, flanged and fitting therein with clamping screws, said dial having compass readings upon opposite sides and reverse from each other. A central socket opening is made upon one side adapted to receive the standard of the sight bar and a socket for the shadow pin upon the other side. This shadow pin may consist of a single slender pin or a rectangular open frame extending upwardly from the socket piece and having a wire stretched across the opening.

PHOTOGRAPHIC MOUNT.—P. J. Stuparich, San Francisco, Cal. No. 31,213. Dated July 11, 1899. This design consists of a border of raised lines or ribs radially disposed from a central space which may be circular, oval or rectangular. The outer ends of these raised radial lines are made of different lengths so as to present a wavy or serrated outline.

Mining Summary.

ALASKA.

Reports from the Cape Nome region brought by men from the Arctic region are very conflicting. Some claim that the diggings are shallow and immensely rich, others saying that there is gold there but in small quantities, and still others say positively that the rich strikes were "fixed."—that is, salted for the purpose of creating a stampede, by which the transportation companies benefit largely whether gold is found or not.

North of Cape Nome there is said to be a deposit of lead-silver ore, from which one shipment was made for San Francisco some years ago, but the schooner was lost and the cargo never reached its destination and the mine has never been disturbed since. It will probably be brought into prominence again during the present Cape Nome excitement.

ARIZONA.

Dry placer mines said to be rich have been found near Ehrenburg, on the Colorado river. A number of prospectors have gone there. Back some distance from the river are local deposits of cemented gravel in which coarse gold occurs. The gold was no doubt derived from veins in the vicinity. These deposits are much like those worked in western Australia.

The Copper Queen at Bisbee is to enlarge its smelting capacity and install a large hoist at the new three-compartment shaft. Two shifts are working on the Huber-Robinson properties, six miles east from Bisbee. The pay streak continues to a depth of 40 feet, assays running well in gold.

Phœnix *Gazette*: The Harqua Hala mine, in northeastern Yuma county, was sold by its original owners for $75,000, but later sold for $2,000,000, after Hubbard Bowers of Redlands had extracted nearly that amount from its stopes. Soon after the English company purchased the mine the ore body worked out, and for several years the mill has been running on custom work and tailings, the latter being cyanided. August 14th, at the court house in Yuma, the mine and mill site, the pumping plant that once supplied water from Harrisburg, a 40-stamp mill and cyanide plant are to be sold.

Prescott *Journal-Miner*: J. P. Bauder, Mgr. New Hope M. & M. Co., has six men at work on the Mountain Driver group, Eugene gulch, in the Chaparral district. The above company has a bond on the property, which is owned by A. Denny. It shows up well as far as developed. The company will sink 200 feet deeper.

Los Angeles *Express*: A. W. Fisher of Los Angeles has bought another gold mine in Yavapai county, Arizona. Mr. Fisher, who is Pres. and Gen. Mgr. of the Monte Cristo M. Co., has secured from R. J. Holmes the Monarch mine for $20,000.

Globe *Times*: In Yavapai county the two mills at Placeritas, south of Prescott, are running night and day.—The Bordeaux mine on upper Big Bug has a new steam hoist.—A new mill has arrived for M. C. Parmlee for the Dividend and Ticonderoga claims, extensions of the Little Jessie in the Chaparral district.—The Red Rock mill is working day and night on Big Bug.

Prospector: The turquoise mines of Cochise county have been placed under option for sale to New York parties.

Copper Era: The Arizona Copper Co. have completed their elevator wheel for lifting slag into a large flume which will carry it out and over the present surface of the river bed. The wheel has a capacity of 250 tons every twenty-four hours.

CALIFORNIA.

Amador.

There are several miles of mineral land on the main gold belt in this county of which little is known, the prospect holes being only superficial or lacking altogether. The Empire and Pacific mines are near Plymouth and produced several millions. Half a mile north of them is the Alpine. Still north there are only shallow holes until the Bay State mine is reached, a distance of four miles. Near Jackson, one of the richest portions of the lode, it is wholly unknown for a distance of over a mile. This is more remarkable in view of the fact that some of the richest mines in the State are in operation on the same vein near by.

The five-stamp mill at the Jackson Butte mine, which started up a few days ago, will be augmented by five more stamps, which are in course of installation. The mill was shut down some months ago until a tunnel at a lower level could be driven to the ledge which has now been reached. The ledge is 8 to 12 feet thick.

Sutter Creek *Record*: At the Central Eureka mine near Sutter Creek high-grade ore is reported found in the 1300 level and at the bottom of the shaft at 1450 feet.—A crushing of 175 tons of ore is being hauled from the Potazuba mine in Sutter Creek to the Zeile mill at Jackson.—The sale of the Bunker Hill mining property to C. R. Downs and others for $30,500 has been confirmed by the court.

Jackson *Republican*: Work at the Valparaiso mine, south of Jackson, is interfered with on account of bad air. The old Nevill's works were tapped but circulation failed owing to caves which have taken place. One hundred tons of rich ore are on the dump. This will not be hauled to the mill by the lessees until the end of their lease.—At Amador Queen No. 1 the force has been reduced. Sinking has been stopped for the present and only drifting is going on.—The Red Hill mill has started up again, using Blue Lakes water for power. It has been closed down for several months.—Two men are at work in the tunnel on the Belluomini ranch, one mile south of Jackson. The tunnel is now in 60 feet and 400 feet will be required to reach the ledge which shows on the hill west of the entrance and 100 feet above it.—South of Jackson and 1000 feet west of the Moore mine is the claim of the Moon Bros., who have been prospecting here for several years. Some years ago they started a shaft 100 feet south of the present one, and at a depth of 125 feet water was opened by a blast and the mine was flooded so quickly that the men scarcely had time to bring out their tools. The water gained steadily and the shaft had to be abandoned. A new shaft was started.

Jackson *Dispatch*: Gibbons & Horr have started their clay and gravel washer at the Gillespie gravel mine. Much interest is taken in this machine by those who have gold bearing clay claims.—At the Ranlett copper mine the shaft has been unwatered and miners are drifting, upraising and taking out ore. Grading for the smelter is in progress.—At the Amador Queen mine No. 2, south of Jackson, Supt. Phillips reports they have finished changing the hoist from a single to a double one, are unwatering the shaft and will sink deeper. Drifting at the 800-foot level will be commenced as soon as the water is out.

Butte.

Oroville *Mercury*: D. M. DeLong of the North Fork mines has washed from the gravels of that stream coarse gold worth $140, another piece of $100 and so on down to $10 and $20 nuggets. The company is running two pack trains carrying in supplies and machinery. It has an electric lighting plant and is constructing a hydraulic elevator. When the elevator is completed, work will be pushed. Twenty-five men are employed. This company owns ten miles of river bed, and the plant being constructed will be the first of several.

In Butte county the following minerals are found: Gold, silver, sulphides of antimony, arsenic and copper; asbestos, white and long fiber; chrome iron, clay, granite of various colors, iron ores and manganese ores.

Calaveras.

San Andreas *Prospect*: Operations on the Vorlander, near the Middle Bar bridge, are progressing under the superintendency of C. M. Burleson. The shaft is down 30 feet, the new ditch, a mile in length, is completed, and the hoist will be ready for operation in ten days.—C. Tryon, sinking 200 feet in the Brunner mine, has nearly finished his contract. This week a body of ore 30 feet in width was struck. It prospects well.

El Dorado.

At the Griffith mine, near Diamond Springs, they have attained a depth of 750 feet, where another station will be cut and sinking resumed.

The Pacific Gravel M. Co. has been incorporated, to operate mines in El Dorado county, and the principal place of business is Sacramento. The capital stock is $50,000. The directors are F. L. Atkinson, W. A. Desborough, H. U. Prindle, J. T. Martin and J. W. Guthrie of Sacramento.

Placerville *Republican*: The Umatilla mine on the south side of the county near Coyoteville is using a new contrivance for working the cemented gravels of the river channels. The Umatilla mine is on the south side of a ridge between Spanish creek and Cedar creek, and its characteristics are similar to the ancient channels in this vicinity. The company is working the cemented gravel by means of a revolving, hexagonal or six-sided hollow cylinder 6 feet long and 6 feet in exterior diameter. It is faced with heavy iron bars and arranged with screens so that the gravel introduced at one end and mingled with water falls continually upon the bars, the stones assisting in crushing the cement. The cylinder makes 300 revolutions per minute and requires power equal to a 10-stamp mill. It has a capacity of 226 tons of gravel in twenty-four hours. John Rowlands is foreman. An amalgamating attachment consists of a grooved plank, which is rapidly vibrated while the gold-bearing material passes over it. The result is that the sand in the grooves is prevented from packing and the gold and quicksilver are permitted to settle to the bottom.

Placerville *Nugget*: E. W. Chapman has begun development work on the Charles Nelson quartz mine near Henry's Diggings. A steam hoist and pump will be put in.—Twenty-five men are employed at the Mt. Pleasant mine at Grizzly Flat. Ore is being broken in the old workings and the shaft is being sunk to greater depth. It is down 800 feet.—Development work at the Mt. Hope mine, Grizzly district, has been resumed under the superintendency of W. R. Pearson.—At Volcanoville the Gem shaft is 50 feet in depth. They are following an 18-inch ledge of high-grade ore.—F. H. Jermyn, of Scranton, Pa., is the principal owner in the Red Hill quartz mine, Kelsey district. He will begin development work on the property.—The McGraw mine, near Kelsey, has been bonded by McGraw & Roberts to Hayward & Lane for $30,000.—A New York company is unwatering the Pocahontas mine at Dogtown for the purpose of investigation. T. J. Houghton is superintending the work.

Fresno.

The San Joaquin Oil Co. has incorporated at Hanford; capital stock, $50,000.

Inyo.

Los Angeles *Times*: Specimens of copper ore have been brought in from the Copper Bell mine, in the South Slate range of mountains, by W. C. Ross, who, with W. E. Patterson of Los Angeles, owns the property. Assays of the ore showed 16½ copper, $5 gold and seven ounces silver.

Kern.

Randsburg *Miner*: The G. B. mine at Randsburg has changed hands. Powers, McCombs & McCormack having sold it on a working bond to S. Johnson of Cripple Creek, Colo. D. A. Clements is in charge of the property for Mr. Johnson and has put a number of men to work.—Work has been resumed on the Pinmore and men are taking out ore. The Pinmore is a large vein of low-grade ore close to the Red Dog mill.—Henry and Harold Ashford, with a force of men are at work on the King Soloman taking out ore. They will put leasers on the Hector and several other mines owned by them.—The Yellow Aster mill is crushing 130 tons per day.

Los Angeles.

On the 13th inst., in the city of Los Angeles, the Miners' Association of Southern California was organized. The officers are: Chas. B. Boothe, president; C. A. Burcham and C. S. McKelvey, vice-presidents; H. O. Collins, treasurer; Geo. N. Nolan, secretary; G. W. Parsons, G. Borden, A. Richardson, H. B. Botsford, executive committee.

Madera.

(Special Correspondence).—In the vicinity of Mount Raymond five miles east of Fish camp on the Yosemite road from Raymond to the valley, is a number of mines which have been neglected for ten years. At one time the camp was a scene of activity and promised much for this mineral belt in the high Sierra. The mines are at an altitude of 8000 to 9000 feet above the sea, and considerable work of a superficial character has been done. The ores consist of lead, zinc and iron sulphides carrying silver. Some of the ore is high grade in zinc, and some of it runs well in lead. The ore can be worked only by concentration. A large concentrating mill was built here ten years ago but proved a failure. With the present high price of base metals these mines in proper hands might be made valuable. The mill and principal group of mines are connected by wire tramway a mile in length. The ore bodies are large in the Star mine and are opened by surface cuts. No systematic development has ever been undertaken, and the short season has been a drawback. The mill contained rolls, tramnels, jigs and buddles, and the ore was concentrated and shipped. The formation in which these mines occur is diorite, the ore appearing as large lenses without well defined walls.

Fish Camp, Cal., July 15th, '99.

Mariposa.

The Merced *Star* says there was $60,000 in bullion in the safe of the Merced Company at the time of the recent fire in Coulterville.

Nevada.

The Boston Stock Exchange has admitted to the unlisted department 250,000 shares, par $10, of the North Star Mines Co. The company is incorporated under New Jerssy laws with an authorized capital of 500,000 shares. The officers are: J. D. Hague, president; W. L. Bull, vice-president; W. D. Pagan, secretary and treasurer. Directors: A. G. Agnew, W. L. Bull, J. D. Hague, W. D. Pagan, Benjamin Strong. The principal office of the company is at 18 Wall street, New York.

Grass Valley *Union*: The Conlan, now known as the Jefferson mine has been bonded by San Francisco parties. J. Lawrence, representing the company is in Grass Valley arranging for starting work at the mine. The Hermosa plant has been purchased by the company and is on the Conlan ground. The mine will be pumped out and development commenced. The Jefferson is on Osborn Hill, adjoining the Centennial and Osborn Hill mines. An incline shaft was sunk and a good-looking ledge was uncovered.

Nevada City *Herald*: Thieves took $2000 worth of gold from the settling tanks of the Pioneer Reduction Works near Nevada City one night last week.

Nevada City *Herald*: Weissbein Bros. have purchased the interest of the Feeny Bros. in the New York Hill Con. mine at Grass Valley, and with Dr. S. M. Harris and J. Burke will develop the property.

Placer.

The High Point M. Co., Ltd., has been organized to operate at Blue Canyon. The directors are S. F. Bolliet, F. W. Tutin, G. W. Stahl, J. H. Sandholm, W. H. Bisbee, Des Moines, Iowa; P. Henry, Truckee; D. H. Rittenhouse, O. O. De Pew, Blue Canyon; capital, $2,000,000.

Colfax *Sentinel*: At the Washington quartz mine in Old Man mountain, eight miles from Cisco, near Carlisle, ten men are employed. The mine is owned by Bruner & Hirsh, O. W. Bruner Supt. A cable tramway 2200 feet long is being built. A carload of ore will be shipped daily to Selby's at San Francisco. They have 1500 tons on the dump.—Development is in progress at the Mascott quartz mine, two miles northeast of Cisco. The shaft is down 28 feet in a body of ore. The mine is owned by O. W. Bruner of Denver and Freeman & Vineyard of Cisco.—J. Gouldner, owner of the Grant and Kentucky mines near Carlisle in Meadow Lake district, is doing development work and will build a concentrating plant.—A number of quartz locations have been made on the North Fork of the American river nine miles southeast of Cisco. A test of ore taken across an 8-foot ledge returned good values. The claims are owned by W. D. Heaton of Oakland and J. Berry and Freeman & Vineyard.—W. Gray has resumed work in his drift mine below Dutch Flat. Rich gravel was taken out of the channel in the adjoining claim.—The Polar Star mine has closed down after a successful season's run, to be operated again in the fall as soon as the water supply permits.—The hydraulic mines of the Gold Run Gravel Co. have mostly finished work for the season. The force in the drift mine has been temporarily reduced, awaiting development work.—At the Dutch Flat Blue Lead mine the excavations for the mill are about completed and the machinery and building will soon be in place.

Plumas.

Nevada *Transcript*: At the Centennial mine, in Genessee valley, the ore from a 6-foot vein is stoped so that it falls directly into the car, and runs to the mill. Being soft, the ore is not put through a rock breaker, but goes directly from the grizzly to the feeders. One man breaks the ore, while the other delivers it to and attends the mill. Five of the ten stamps are kept running, and at a cost for mining and milling of 50 cents per ton. The mill is a simple but complete affair and is run by water power.

San Diego.

Hoover, Whims & Haines, lessees of the Cleveland-Pacific mines in the Julian district, have cleaned up a run of their ore at the Escondido mill, which resulted in gold worth $1800. Another run made at the mill by F. Roberts from the work of two men during the month cleaned up $1000.

The Owens mine at Julian is being unwatered for the purpose of examination by Pasadena parties.

A. Frary is having a crushing from the Eagle at Bailey's Ready Relief mill at Banner.

Numerous claims have recently been located in Grapevine district in the Julian country. The veins are said to be large and the gold free.

There are some good mines in a prospective stage of development near Pine Valley. The formation is mica schist and the quartz high grade. Some of it carries galena and is rich. The Noble claims have the greatest development. When first discovered the ore was worked in an arrastra, and later a mill was built, but the claims were not sufficiently developed to keep the mill constantly employed.

Shasta.

Through his agent, H. A. Cohen, J. R. De Lamar purchased the Bully Hill copper mine for $200,000 and also bought the Baxter, Callinger, Wentworth and Popejoy mines for less than $25,000. While his agent was negotiating with C. H. Hamilton, representing J. Sallee, H. McDonald filed a suit against Sallee, his one-time partner, for a half interest in the mine and an accounting. The facts are said to be that McDonald and Sallee had a joint option on the Bully Hill three years ago, but the option was allowed to expire. Sallee afterward renewed the option in his own interest, and McDonald now claims that his partner deceived him with the intent of securing it for himself. Sallee gave an option to C. A. Hamilton, who in turn assigned his contract to L. A. Scowden of London. Scowden negotiated with Laidenburg, Thallman & Co. of New York, but, on the report of C. King that a capital of $1,000,000 would be required, they declined to buy. Hamilton secured a new option and sold the property to De Lamar.

Redding *Democrat*: Supt. Shepherd is having a double compartment shaft sunk on the Old Spanish mine near Shasta, and also doing work. A scarcity of water at certain seasons has been a drawback on the Old Spanish claim.—Development work is being done by Geary & Taylor on the original Bunker Hill mine on Middle creek. Encouraging prospects are the result of the work. In early days this mine paid.

Redding *Free Press*: In sinking the new double compartment shaft on the Old Spanish mine water was encountered at 50 feet. Supt. Sheppard is driving a tunnel to carry off the water. The shaft will be sunk 200 feet deeper before a level is run. The second level will be started at a depth of 500 feet. Work is also in progress on the extension of the Enright tunnel, west of the company's offices, and is in 290 feet. In 40 feet the Wiser ledge will be cut. The work of erecting hoisting machinery will be begun next week.—The Sacramento River G. M. Co. has bought two placer claims, one on the Sacramento, near the mouth of Motion creek, the other on Squaw creek. One is the Cottonwood dredger mine, the other the Old Diggings dredger mine. The purchase was made of H. Frickenger, E. Riebe, T. A. Wilson, W. H. Bickford and others.—C. G. Haddock of Los Angeles has purchased the Montgomery claim of F. M. Donovan. The claim is in the neighborhood of the Black Diamond.—It is again reported that a gold streak has been found on Buck ridge, two miles west of North Yalo Bola. There have been a number of reported strikes in that neighborhood.—Nofsinger & Johnson and the estate of J. M. Bryan own eight claims along the ridge near Eagle lake, and have done sufficient work on the Eagle Bird to disclose a good vein of milling ore. After sinking 50 feet they encountered water, and decided to drive a tunnel and went in 110 feet when work was stopped. They will resume the tunnel work. Mr. Nofsinger and his partners have another claim, 3000 feet north and on probably the same ledge as the Eagle Bird, called the Richland, on which they have driven a tunnel 165 feet into porphyry. They have had assays of $8 to $15 a ton, milling ore. They will also continue this tunnel.—The kilns at Keswick were fired recently.

Sierra.

M. W. Mather, Gen. Mgr. of the Crœsus G. M. Co.'s mines, will contract for a new 20-stamp mill for the Plumbago mine and will run another tunnel into the hill, 400 feet lower than this lowest tunnel. At the mouth of it he will build the mill, with power facilities for forty stamps, the other twenty to be added when needed.

Siskiyou.

Yreka *Journal*: Work in the Spencer mine at Humbug is carried on in the upraise from the new tunnel run into the ledge below the old works to reach the works where rich pay was taken out, and suspended on account of water.—The hydraulic miners on the Klamath are short of water and will soon be compelled to shut down. They have had a good season, and realized good pay.—The hydraulic mines at Oro Fino were shut down on the 4th of July, owing to scarcity of water. The company will commence getting ready for the winter, with smaller force.—B. F. Thornton, superintending the development of a quartz mine in Quartz valley for a New York company, reports a new 5-stamp mill completed, and began crushing ore last week.—R. F. Garrett is working night and day hoisting gravel at his river mine near Hamburg Bar. The main

channel is 35 feet deep and the first 18 feet pays for handling, and some of the bedrock gravel pays $10 per tub.——Mr. Van Blunt, purchaser of the Ock mine, near Happy Camp, is working seventy-five men repairing the South Fork ditch, which is over eighteen miles long and will, when completed, carry 4500 inches of water. There will be three miles of flume, which will be 6 feet wide. Seven hundred thousand feet of lumber will be required to equip the mine.

Yreka *Journal*: The Greenhorn Blue Gravel mine has been troubled with caves lately, which interfere with operations, causing men to be laid off until the drifts are cleared——A 10-inch pump has been put in at the Nehrbass ranch, adjoining the Greenhorn Blue Gravel mine. The shaft is down 108 feet, in which there is too much water for the old pump. With both pumps the water will be lifted and furnish a supply for sluicing.——Managers of the Gumboot mine near Scott Bar have put on a force and find quartz, which they believe will pay. They are getting ready to put up a mill and also contemplate building a road to the Scott River divide road, to reach Fort Jones in twelve miles.——W. A. Bantz, working the Cape mine on Greenhorn, finds the rock rich, with the ledge varying from 6 to 18 inches in width.

Tuolumne.

Recent assays of ore from the 200-foot level of the Draper mine, a mile southwest of Soulsbyville, shows gold $475.41, silver $18 85; total $494.26.

Union Democrat: The Mexican mine, owned and operated by the Mexican M. Co., is on Big creek, six miles from Groveland. The property consists of nine locations. The development consists of a shaft 160 feet deep on the vein, with sinking progressing. The quartz is 3 feet wide. Tests show the rock to carry a value in free-milling gold and 1% of concentrates worth $124 a ton. The mine is equipped with a steam hoist, 2-stamp mill, concentrating plant and amalgamator. The Supt. is J. Urquhart.——At the Goldwin mines, on the lower end of North Fork canyon, the new work consists in sinking deeper the winze in the tunnel on the Rhode Island ground. After unwatering this winze, which had been abandoned at 58 feet, Capt. McClintock put miners to sinking. Drifts will be started at 125 feet. It is the intention to turn the winze into a shaft by upraising to the surface—a distance of 94 feet. The ground has been stoped along the vein 105 feet, being the length of the shoot. It is said the rock went $40 per ton in an arrastra.

Trinity.

Redding *Free Press:* A new copper strike has been made a half mile above the Copper Queen mine near Trinity Center, recently purchased by Napa capitalists. The new strike is on Cedar creek, where the ledge shows a width of 200 to 300 feet. A number of locations have already been made.

COLORADO.

H. A. Lee, State Commissioner of Mines, has issued a circular describing a new code of signals which he was required to form in compliance with the new law regulating that department, which reads as follows:

In accordance with the provisions of paragraph 9, section 20, of an act relative to the bureau of mines to establish a uniform code of signals in all mines using hoisting machinery, the following code is hereby established and "shall be securely posted, in clear and legible form, in the engine room, at the collar of the shaft and at each level or station.

Signals:
One bell, hoist. (See rule 2.)
One bell, stop, if in motion.
Two bells, lower. (See rule 2.)
Three bells, men on, run slow. (See rule 2.)
Seven bells, accident; hoist or lower by verbal orders only.
Three-two-one bells, ready to shoot (See rule 3.)
Engineers' signal—Engineers shall after signal three-two-one raise the bucket or cage 2 feet and lower again, and shall remain at his post until final signal is given and command executed.

Rules governing signals:
Rule 1—In giving ordinary signals make strokes on bell at regular intervals. In signals similar to "ready to shoot" (three-two-one bells) each bar (——) must take the same time as one stroke of the bell. Rule 2—When men are to be hoisted or lowered, give the signal for "Men on; run slow" (three bells). Men must then get on bucket or cage, then give signal to hoist or lower (one bell or two bells). Rule 3—After signal "Ready to shoot" (three-two-one bells), engineer must give signal that he is ready to hoist by raising and lowering bucket 2 feet. Miners must then give the signal "Men on" (three bells), then "spit fuse," get on bucket or cage and give signal to hoist. Rule 4—All timbers, tools, etc., "longer than the depth of bucket" or placed within a cage must be securely lashed before being hoisted or lowered. Rule 5—Signals to meet local demands and not in conflict with above may be added by individual operators, but the same must be posted in clear and legible form in connection with above code.

BOULDER COUNTY.

The rich streak of ore in the Virginia mine at Eldora is reported 21 inches wide. It has produced some very rich ore.

Denver *Mining Reporter*: The Utica mine at Ward produces gold ore worth $5000 per car. This ore averages $200 per ton. Last year a fire gutted the mine and closed it temporarily. Before that it had produced on an average of $10,000 per month profit. The Utica is on the Columbia vein. The lode has produced $5,000,000 in gold.

CLEAR CREEK COUNTY.

Denver *Republican:* J. J. May has calculated that the Newhouse tunnel would cut the vein in 100 feet of crosscutting. An agreement has been made for the working of this property through the tunnel when the vein had been cut. The company is drifting east in the lower level and stoping a body of ore that has been opened for 300 feet. This is a lead ore, with gold and silver values. Some of the product is shipped direct to the smelters and the rest is being treated by concentration at the Jackson mill.——J. E. Keefer, Mgr. Golconda tunnel and group of mines, says sinking of the shaft on the Mahana lode will be resumed as quick as the machinery being installed could be started. The shaft will be continued to a junction with two other lodes.

GILPIN COUNTY.

Sinking was commenced at the Fisk mine on Bobtail hill, Central City with three eight-hour shifts at a depth of over 1000 feet. The shaft will be put down 75 feet and if water troubles do not occur a further lift of 75 feet will be sunk. The water has been going down, being drained by the crosscut from the Gregory incline. Sixty-five men are employed and daily shipments have reached seventy tons, nearly all of which is milling ore.

Sinking has commenced at the Great North Danus mine on Swede hill. The shaft is down 100 feet and sinking will continue with two shifts and air drills. Mayor Thompson of Black Hawk is in charge for the Massachusetts owners.

Pumps are going at the Rialto and the water is near the 300 level. The shaft is down 530 feet and is to be sunk 470 feet. C. K. Colvin is in charge for the Ridgeway Co.

HINSDALE COUNTY.

Lake City *Times*: A carload of fine ore has been shipped by Hill & Griffiths, leasers of the Wyoming property at Lake City.——The Guionneau Bros., owners of the Gallic-Vulcan mine, above Capitol City, shipped a half car of concentrates and a half car of assorted ore recently.

LAKE COUNTY.

The Leadville Public Sampling Works is sampling zinc ores for the Vielle Montague zinc works at Antwerp, Belgium. Twenty men are employed, working ten hours per day. The men have been receiving $2 per day, but recently they reqested Mgr. Norton to increase the wages to $2.20 per day. The request was refused and a new force of men has been employed and the mill is running.

Leadville *Miner*: The old Chrysolite mill, located between the American and Bi-Metallic smelters in California gulch, Leadville, which was built in '96 by J. F. Campion and W. B. Page as a cyanide mill, has been started under the management of C. A. Hoyt, formerly of the Moffat cyanide mill at Florence, Colo. Ten men are employed. Some changes will be made in the mill and experimental tests are to be made on Ibex ore.——The Montgomery claim on the California gulch slope of Iron hill, worked under lease by C. W. Lininger, W. Vivian and associates, has opened up a body of iron at a shallow depth, carrying twelve ounces silver, 41% excess iron, pay gold and lead.

Leadville *Miner*: More men were put on at the Arkansas Valley Smelter last week and an addition made to the force on Monday. There are now 150 men at work there, most of whom are in the sampling department.——At the Bi-Metallic there are 160 men at work and the number is being increased.

SAN MIGUEL COUNTY.

Telluride *Examiner*: Work at the Bessie mill is being pushed, and it is expected that the plant will be ready to operate by Aug. 15. Complete tests as to the proper treatment for the ore have been completed and the mill planned accordingly, embracing all the latest improvements used in cyanide plants of this country and at Johannesburg. Lots of Bessie ore covering 250 tons were tested at the Metallic Extraction Co. plant at Cyanide, near Florence, under the management of P. Argall. The ore was found to be adapted to the process, and designs for the mill were made by H. A. Vezin of Denver. Mr. Argall supervised the designing of the Bessie mill plant with Mr. Vezin, and E. C. Englehart has been secured as Supt. of the mill. The mine has a large amount of ground opened up for a steady production when the mill is ready to start.——At the Waterloo the main tunnel of the upper level is in 756 feet on a vein from 3 to 5 feet in width. At the breast the vein measures over 5 feet. The shaft is down 112 feet, and from this point drifts run in both directions. The drift to the west shows 3 feet of vein matter. The one drifting east has a 5-foot vein at the breast, 56 feet from shaft. Arrangements are being made to have a run of 200 tons of the ore at the Butterfield mill. It is the intention of the company to test the ore by different processes and then erect a suitable plant.——H. F. Bosworth is manager.——The sale of the Ajax group of five claims, in Marshall basin, was closed five days ago, and the property passes into the hands of the New England Exploration Co. The Ajax is a continuation of the Smuggler vein, lying across Marshall creek from the Smuggler-Union mine. It has been developed. For a considerable time it has been idle, being owned by Eastern parties. Upon the New England Exploration Co. securing the Smuggler-Union, they set about securing this extension. It is said that $150,000 is the price named in the bond.——The Saw Pit G. M. & M. Co., operating in the Navajo basin side of the Mt. Wilson district, have cut a 3-foot vein of ore in the tunnel which has been run by Dudley Bros. during the past winter. The vein is the Seymour, and there remains 50 or 60 feet to drive to cut the Slide vein, the prominent one of the group and the objective point of the drift. The group consists of five claims, all showing leads on the surface, and this drift will eventually be the outlet for the working of all these veins. The company have decided to build a mill of ten to twenty stamps with concentrating machinery.

TELLER COUNTY.

The Mary McKinney at Anaconda is reported sold to the Venture Co. of London.

A find has been made on the Gold King of the International G. M. & M. Co. on Gold hill, Cripple Creek. A shot was put into the hanging wall of the stope where it was thought to have pinched out, and resulted in opening a vein which carries high values, the ore carrying streaks of sylvanite and calaverite. The high values are scattered through the rock.

A full force is employed at the Lillie mine, and production up to the average being made. The force was curtailed recently on account of the market for Lillie ore being affected. Sinking is still in progress to 800 feet. An underground hoist is being used, and 90 feet of the sinking has been completed. A settlement made on a recent consignment gave returns of 15 ounces to the ton.

IDAHO.

Amended articles of incorporation of the Trade Dollar M. & M. Co. were filed last week in Boise. They change the name of the company to the Trade Dollar Con. M. Co.; increase their capital stock from $2,500,000 to $4,000,000; establish their headquarters in Owyhee county and name J. Hutchinson as their agent in Idaho. This is the company that consolidated the Trade Dollar and Florida Mountain mines.

Boise *Statesman*: D. Coughanour has sold the Iowa and other properties in Boise basin to an English company. The price paid was $215,000. The deal involves the transfer of the Iowa group of five claims and the Yellow Jacket group of two claims. The company paid $115,000 for the Iowa group and the mill and $100,000 for the Yellow Jacket. H. Edlin secured the option last spring and made the deal through Judge Heyburn. Mr. Edlin assayed 268 samples and found the average value to be $15 per ton.——On the Clearwater river, in what is known as the Cove country, eighteen miles from Buffalo Hump, is said to be a rich placer discovery, which is reported sold to Mr. Liggitt and other Butte, Mont., parties for $60,000. The original owners are Grangeville and Mt. Idaho men. There are 160 acres is the claim. The ground is rich.——The discovery of rich copper deposits is reported in the north end of the Seven Devils district, on the range between Rapid and Snake rivers.

Spokane *Chronicle*: The De Lamar bond on the Big Buffalo groups expires on the 15th inst. The payment to be made then is $50,000.——B. Rigley, one of the locators and principal owner of the Big Buffalo group, has been at the Hump since the lapse of the bond given to Clark & Sweeny. When the new bond was given to the De Lamar syndicate, Mr. Rigley decided the ground had not been opened to the best advantage. Since then men have been crosscutting and drifting. Mr. Rigley at Lewiston said that Clark & Sweeny missed the rich shoot and worked the low-grade ledge. The Oro Fino shows two parallel veins 250 feet apart. A surface crosscut has been run and good average value obtained. The ground is clear of snow at the Big Buffalo and practically throughout the camp.——It is not generally known that there is a mine in Idaho county which is not only fully developed in a mining sense, but is a producer, having yielded under unfavorable conditions, the sum of $380,000 in gold. The Little Giant mine at Warrens, in Idaho county, was located in the fall of 1881 by G. Reibold. His first work consisted of a tunnel 430 feet in length on the lead, which was from 2 inches to 4 feet wide. Thirty-three tons of first-class ore returned $425 in gold per ton, and seventeen tons of second-class ore went $180.

Spokesman-Review: Miners are rushing to the Syndicate camp in the Burnt Creek district of Central Idaho. The development of the Syndicate group is the cause of the excitement. Latest reports are that fifty claims were located last week on the mountain on which the Syndicate group is situated. Some are conflicting locations, and there is prospect of trouble. A townsite has been laid out. Supt. J. F. Johnston of the Syndicate has men driving a tunnel on one of the veins, which shows assays of $83.75 per ton. He has a crew prospecting several claims and says that some large veins have been uncovered. In the placers in the vicinity, Mr. Johnston writes that J. Osborne has cleaned up a small piece of bedrock which netted him $700. McGann Bros. are opening new ground, which is proving good.——D. B. Huntley of the De Lamar M. Co., Ltd., has gone to Buffalo Hump. He was joined at Grangeville by J. J. Bennett and they will make an investigation of the Big Buffalo, Oro Fino and Merrimac, the claims developed to some extent by Clark & Sweeny and afterward bonded to the De Lamar Co. for $500,000, $25,000 of which was paid July 15th. Mr. Huntley states that he was not satisfied with conditions when last in the Hump and that the snow was too deep to intelligently judge the mines, though the samples secured by him were satisfactory. He will also examine several other properties on which his company has an option.——In the Jumbo is reported a strike of 4 feet of solid ore which will go $100 in gold. A rich strike is also reported in the Cracker Jack. The report credits the the mine with 13 inches of $100 ore. The lead in the San Francisco was crosscut some weeks past. The snow is gone, and one can ride into Buffalo on horseback over a good trail. The woods are full of prospectors.

MICHIGAN.

Another strike has been made on the Copper Range. Large quantities of copper were revealed from a blast at a pit 900 feet south of the original one in the lode. The showing is the richest thus far exposed.

Some rich copper is being taken out of the old shaft being opened at the Oneco.

Active mining is under way at the Resolute property in Keewanee. Old workings are being unwatered and new mineral belts located.

The recent $6 dividend of the Quincy M. Co. is an increase of $2.50 over the previous semi-annual disbursement. For the first six months of '99 the company produced between 7,000,000 and 7,500,000 pounds of copper. The production for the entire year of '98 was 16,354,061 pounds. The falling off the first half of this year was due to the ore being poorer than usual. For the six months of this year the company's net earnings were equivalent to about $7.50 per share, and the surplus above the $6 paid to stockholders goes into construction. The company has $900,000 cash on hand above the $600,000 to be distributed in dividends on Aug. 15th. The company is arranging to bring its production up to 25,000,000 pounds of copper per annum. In former days Quincy laid its copper down in New York as low as 5.91c per pound. The company does its own smelting, saving $50,000 per annum. The new No. 7 shaft is completed except for timbering which will take another six months.

MISSOURI.

The American Zinc, Lead & Smelting Co. is stated to have made a rich find on one of its newly acquired properties near Joplin.

MONTANA.

The Butte & Boston M. Co. has filed its annual report with county clerk and recorder. It shows that the capital stock of company is $2,000,000. Assets, July 1, 1899, are given at $3,500,000, consisting of real estate and personal property, and liabilities at $1,652,305, of which $1,500,000 are bonds.

The copper output of Montana for the year 1899, it is claimed, will exceed that of 1898, in which year it reached 206,173,157 pounds. The increase, it is said, will be due to new properties and to stimulated output in old mines.

Butte *Inter-Mountain*: It is reported in Madison county that within the next twelve months, twelve dredging machines, each costing $100,000, will be installed by the German Bar and Conrey Placer Mining Companies. These two concerns, which are practically one, began operations in Alder gulch two years ago, and have conducted a series of experiments, some of which have proved successful and others not, but which have demonstrated the values contained in the farm lands at the mouth of Alder gulch, land that for thirty-five years had been used to raise cabbage and alfalfa upon. After the first year's operations the companies quietly acquired the ground from several miles up the gulch to the Ruby river. Then the Maggie Gibson dredger was removed from Bannack and installed there. Now comes the announcement that the company will install twelve machines, similar to the Maggie Gibson.

Bozeman *Chronicle*: R. B. Turner, representing the Nevada and Utah Exploration Company, has made a contract for a cyanide mill with a capacity of fifty tons per day. The mill is to be erected at Norris to work ore from the Madisonian mine, of which Mr. Turner and his brother are the principal owners. The mill will be completed in three months.

NEVADA.

Recent measurements show that since the Risdon hydraulic system has been in operation water in the Belcher shaft in Gold Hill, two miles from the C. & C. shaft, has been lowered 22 feet. This demonstrates that the clay walls of the lode do not act as impervious bulkheads to confine the water within certain limits.

Pumping operations at the C. & C. shaft at the Comstock are making some progress. The last dispatch is as follows:

VIRGINIA, NEV., July 20, 1899.—To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco—Elevator No. 1 has been working continuously. At 6:30 this morning the water was 3 feet and 3 inches below the 1950-foot level station.

The water has been lowered 1 foot and 6 inches in the preceding twenty-four hours.

The Cuyahoga M. Co. of Smith Valley in running a tunnel to prospect the Little Bonanza, one of the company's claims, recently struck an 18-inch ledge of good ore. Assays show the ore to run from $40 to $80 in gold. This company has built a mill, laboratory, etc. The company has not yet decided whether a stamp mill or a crusher will be used. Both will be tried and the method which gives the best results will be adopted. The laboratory will be in charge of A. C. Gleason of Cleveland, Ohio.

The smelter at the Reno Electric Reduction Works is not a success.

H. A. Cohen is at San Antonio, Nye county, where he is sampling a group of mines that have been bonded by him for $100,000. The group was recently located by T. J. Bell and J. G. Court, from which rich ores were taken from the first. Since acquiring the option Mr. Cohen has put on many miners and is following the shoot that is showing high values. Prospecting for water three miles distant has been successful.

The Osceola mine is putting fifty tons of ore daily through the mill, the material showing an average of $12 in gold per ton. An increase in the capacity of the plant is being considered.

Judge Burton and J. F. Cowan of Salt Lake have secured an option on eleven undeveloped locations.

The Dexter mine at Tuscarora has recently shipped bullion valued at $5800 and auro-cyanides valued at $3000.

A strike of high-grade silver-lead ore is reported in Alida district, Esmeralda county.

Two groups of mines in White Pine county, comprising twelve locations in Robinson and West Camp districts, have been bonded in Salt Lake.

Another shift has been added to the force in the northern extension of the Zadig drift on the Sutro tunnel level of the Brunswick lode through Savage, Gould & Curry and Best & Belcher territory.

A reduction plant is to be added to the equipment of the Utah Spur mine at De Lamar, Lincoln county.

Work is to be resumed in the Meadow Valley mine at Pioche. Regular bullion shipments were made from that mine thirty years ago.

The Comstock Pumping Association reports having a balance of about $13,500 in its treasury at the present time.

NEW MEXICO.

A new gold discovery is reported fifty miles northeast of El Paso on the El Paso & Northwestern railroad in the Jarilla mountains, a small range, ten miles in length and from

three to four miles wide, and barren of water. The discovery of gold was made last week. The mineralization of the mountains has long been known, but there was some doubt that there was gold in the mountains. Last week a prospector found twelve colors on the plain, two miles from the mountains and a foot below the surface. Other prospectors went to the locality and found gold. One woman had several nuggets in a handkerchief larger than peas. Heidike is the name given to the entire region known on the map as Otero county, in which the new gold fields are located.

The Colorado Fuel & Iron Co. employ twenty-five teams hauling iron ore to the railroad at Santa Rita.

J. Schlosser is taking ore from his Humboldt and other properties near Hanover, and he expects to make a shipment during the month.

The machinery on the Anson S. is in shape after an idleness of years and the pumps have been started. It will require some time to get everything underground in condition.

Three shafts are being put down on the Hanover mine. The water has been lowered to the top of the drift, 92 feet from the surface, and the pumps are working. G. Kingdom, who was in charge of the mine under the Berry management when it was being worked by the Copper Flat Co. two years ago, is foreman.

OREGON.

Baker City *Republican*: The Red Boy mine near Granite has twenty stamps dropping. It is a regular producer. Its owners are Godfrey & Tabor.——The Congar mine is erecting a 50-ton cyanide plant.——The Magnolia is being developed by its manager, W. J. Vinson.

SOUTH DAKOTA.

(Special Correspondence).—The Cleopatra group of claims, covering 100 acres of ground in lower Squaw Creek canyon, near Spearfish canyon, is being developed by Mgr. R. B. Hughes; 740 feet of tunnels and drifts have been driven on the upper ore-bearing contact in large bodies of ore of good grade, suited to treatment by the cyanide process. A shaft is down 75 feet, sunk with the purpose of exploring the lower quartzite contact, which lies about 100 feet lower. The region in which these mines are situated is very rugged, and a wagon road has been built from the Carbonate road to the mines at considerable expense.

Deadwood, July 11th, '99.

The stockholders of the Homestake M. Co. at a meeting in San Francisco, Cal., have authorized, by a special vote, an increase of the capital stock from its present amount of $12,500,000, divided into 125,000 shares of the par value of $100 each, to $21,000,000, divided into 210,000 shares of the par value of $100 each. The increased capital is to be used in payment for additional property, etc. It is reported that the Higland and other mines contiguous to the Homestake are to be absorbed, also the Black Hills Canal & Water Co. and the Black Hills & Fort Pierre Railroad, which was originally built to deliver timber and fuel to the mines of the Homestake Co. from the timber belt south of the mines.

UTAH.

It is stated that T. A. Edison is conducting a series of experimental tests of the ores of the Boston Con. M. Co., at Bingham, and that some of them have been successful, it being believed that low-grade ore can be treated at a profit of $1 per ton.

Three tons of auro-cyanides were delivered at the Con. Kansas City Smelting & Refining Co.'s works at Salt Lake last Saturday, the Golden Gate at Mercur sending two tons, the Northern Light of Lion Hill and the Wilson Leaching Co. of White Pine, Nev., supplying the balance. The total value was estimated at $150,000.

Mercur *Mercury*: Men are at work on the Golden Gate Extension. A double compartment shaft has been started and has reached a depth of 40 feet. The hill is being graded off for the erection of buildings and an electric hoist will be put on the ground. It is the intention to sink the shaft 1500 feet, it being estimated that at this depth the veins in the Mercur and Golden Gate should be cut.——Two shifts are sinking the new shaft on the Rover, under the direction of the Golden Gate management.

Park City *Record*: A new strike of milling ore has been made in the Lookout group, owned by Jordan & Thomas, in Blue Ledge district, on the east face of Bald mountain. The owners have run a crosscut tunnel 30 feet, cutting the vein, after which they sunk on it 80 feet. The vein is 6 feet wide, with porphyry hanging and quartzite foot. The average shows thirty-five ounces silver and $4 gold, with a trace of lead.

Salt Lake *Tribune*: The management of the Daisy Mining Co., which was the first to begin the production of gold dust on the West Dip, has decided on the enlargement of its plants and plans will be submitted to make the capacity 300 tons daily.——Mgr. Farnsworth of the Horn Silver, at Frisco, says the work there is developing interesting changes. The Horn Silver has always had a defined chute of copper ore. Some years ago there was a cave of the workings. With the mass that came was the copper ore. To the 800-foot level this material was displaced, the ores mixing with the waste. When a market was created for ore by the advance in the metal, Mgr. Farnsworth decided to get it above as well as below the 800-foot level. A recent shipment of this class of ore was made and sold on a basis of 28% copper, 15% lead, eight ounces silver and 75 cents gold per ton. The main workings are at a depth of 1630 feet.——Reports at the offices of the New Pass M. Co., at Salt Lake, indicate that the properties are the foundation for a new camp. The new strike in New Pass territory has continued to improve with development.——T. Bruback, who purchased the holdings of the Morgan M. Co. at Park City for $100,000, says the report that it had been conveyed to the Daly-West Co. is inaccurate.——D. C. Jackling, Supt. of the Golden Gate mill at Mercur, will equip the Mercur mill with machinery to treat its arsenical ores.——The Mammoth mill at Robinson has started up again.——The Washington at Frisco has started up and will begin marketing high-grade ores.——Timbers having reached the Northern Light on Lion hill, the management will re-enter the chloride stope in which the high-grade ores are found and begin shipping.

WASHINGTON.

The Bonanza M. Co. has been incorporated to purchase and operate the Bonanza, a shipping mine near Bossburg. The Bonanza ore carries iron, lead and silver and smelters pay a premium for it. The mine has been shipping 100 to 125 tons per week. It is developed by inclines following the ore at an angle of 45° to the depth of 500 feet. The vein is said to average 10 feet wide with swells in places to 22 feet.

The Black Bear-War Eagle Gold Mines (inc.) is the name of a company which has been formed and is practically under the same control as the Bonanza. The War Eagle and Black Bear claims are on Palmer mountain and their veins will be cut by the Palmer Mountain tunnel.

The Black Bear has a 5-stamp mill built on the property in the days of the first Okanogan boom by S. I. Silverman. There are fifteen extra stamps on the ground at the mine which will be installed in the mill, five of them going in at once. J. Boyd, Supt. Palmer Mountain Tunnel Co., is in charge and is putting in hoisting machinery on the Black Bear. This claim is developed by shaft to a depth of 182 feet with three levels on the ore.

The Palmer Mountain tunnel will cut the Black Bear lead at a depth of 800 feet and the three leads on the War Eagle at a depth of 1300 feet.

The War Eagle has a shaft down 100 feet with a crosscut, which has opened two other leads in addition to the one followed by the shaft.

Spokesman-Review: In the Flat creek district the Solyon and Hercules claims on Mineral mountain, two miles below the Churchill group, a shaft is down 47 feet, following the foot wall of a vein 35 feet wide. It is a copper-gold ore with iron cap. In this district S. Wilson owns the Ultra and Daisy, on the same lead as the Solyon and Hercules. The vein has been traced 2000 feet and has been opened by cuts.——On the Churchill group new machinery has been installed and the property is being developed with three shifts under the supervision of J. S. Bogle. The company has a 30 H. P. boiler, with a pump and hoist, and is equipped to run steam drills, although these have not been put in.——On Boulder mountain the Badger State M. & M. Co. is opening a property. The shaft is down 70 feet in quartz carrying gold and copper. At 20 feet the values were $9.70 in the two metals. The vein fills the shaft and has never been crosscut. The same company is sinking a shaft on the Racine, in the group. The shaft is down 25 feet.——The Golden Zone has nearly 2000 feet of tunnels, four in number, which are being connected by winze and raise; 20,000 tons of ore have been blocked out. They are building a thirty-ton concentrator, and have completed houses for men and residence for manager. Forty men are employed. This company have 500 feet of tunnels and drifts and several hundred feet of shafts. They are putting in a 10-stamp mill, concentrator and cyanide plant, and erecting houses, offices and residence. Fifty employed.——Arrangements are completed to put fifty men at work on the Triune. The mill is to be overhauled and enlarged. The shaft will be put down to 500 feet.——Four hundred feet of tunnels and open cuts is the work on the Q. S. A mess and bunk house is being erected. They have tapped a large vein at 600 feet depth with a crosscut tunnel. Eight men employed.——At the Crystal silver-lead mine, which is being opened near old Fort Spokane, two shafts are sunk 100 feet deep and 100 feet apart on the vein, the Gray shaft passing through solid ore for 45 feet before reaching the 100-foot level. The drift was started from the other shaft, and, after proceeding 65 feet through ledge matter filled with stringers of galena, the drift opened a full face of galena and continued in this for 35 feet to the connection with the Gray shaft. When this air connection had been completed, Supt. Gray cut out a station and resumed sinking. The station is 9 feet high from the floor of the drift and 18 feet to the shaft, every foot in solid ore and no wall. In sinking below the station a lean place was found in the vein—not barren, but carrying stringers of galena. There was 13 feet of this, and then the shaft broke into fine ore. The bottom and sides are in solid galena at 121 feet depth. The iron pyrites, abundant in the ore on the surface, are giving way to copper pyrites. Mr. Gray says the company will sink the shaft to the 200 level, from which another drift will be run on the vein and stoping started.——The Palmer Mountain G. M. & T. Co., at 1000 feet depth, cut a 42-foot vein containing 35 feet of ore, showing $37 in gold. On the surface the vein was several feet wide and assayed $11. The other veins have been crosscut at from 200 to 850 feet depth before this last one was reached, and in no instance was the value less than on the surface.——The tunnel is in 2000 feet and twelve veins cut, ranging in width from 5 to 42½ feet, containing pay streaks from 2 to 35 feet. The mine is equipped with air compressor, steam driven, with blower attached, for furnishing and exhausting air. The company is now developing and bringing to the mine a water power of 1500 H. P. Thirty men are employed.

WYOMING.

The Colorado Fuel & Iron Co., it is reported, has completed arrangements for the employment of fifty miners in the iron mines at Hartville, which have been leased by the company.

It is reported that at Saratoga a dike of phonolite has been discovered, extending through the town, in a southwesterly direction. It has been traced for four miles, and is 30 feet wide where it crops out.

Denver *Republican*: The Doane mine, the pioneer copper prospect of the Grand Encampment district, produced last year a large amount of high-grade copper ore, averaging 50% metallic copper, with some gold.——The Rudefeha mine last year, although equipped only with a one-horse whim and bucket, produced 1200 tons of high-grade ore. The last 400 tons was purchased by the Chicago Copper Refining company and averaged 33% copper. The mine has not been developed to the extent of the Doane mine. The owners are sinking a permanent working shaft. They have refused all offers for the property. The principal owners are George Ferris and I. C. Miller.

Grand Encampment *Herald*: A mine has been opened south of the town of Grand Encampment by D. Boyce. In a shaft only 8 feet deep there is a vein of solid copper carbonate ore 18 inches wide running over 60% copper. The vein is in place.——A copper strike is reported at Kelsey in the Sandstone mining district ten miles from Battle Lake, and near the Douglas mine. It is twenty miles west of Grand Encampment. The sandstone reef is said to carry metallic copper.

FOREIGN.

BRITISH COLUMBIA.

Development work on the Golden Eagle, in Brown's camp on the North Fork of Kettle river, continues. The claim is owned by L. S. Moulton-Barrett of Greenwood. It is situated on the southeast side of Volcanic mountain and has been developed to the 100-foot level with numerous crosscuts, drifts and winzes. As the work progressed the ore became richer, until at the 75-foot level the vein filling became solid ore, carrying as high as 20% copper. The Golden Eagle people are drifting along the lead.

The Philadelphia M. Co., under the management of H. T. Sherrard, has bought land near the Butte mills, six miles below Rossland, on the Northport road, and is building a fifty-ton concentrator. The company owns the Mountain Trail claim on the south slope of Sophia mountain, and is building a wagon road between the mill and mine. The distance from the concentrator to the mine is less than two miles.

It is reported at Victoria that a rich placer discovery has been made on the shores of Wreck bay, five miles from Uclueton, on the west coast of Vancouver Island and 100 miles from Victoria. The beach has been staked for miles by settlers, who have abandoned farming. The sand is yielding good returns, much of the fine gold being lost.

A report is current of a strike at Alberni of a rich quartz ledge.

Spokane *Chronicle*: The California mine on Red mountain in Rossland is to be developed. Two years ago the California was sold by J. B. Jones, J. M. Burke and others to a Canadian syndicate headed by J. P. Graves and S. H. C. Miner. No work has ever been done on the property since. It has been decided by the company to start work on the property, and a ten-drill compressor, hoist and sinking pumps will be installed and the necessary buildings will be erected. Development work has been decided on, and W. Y. Williams, Supt. Big Three properties, will have charge of the California. It is on the southwest slope of Red mountain, 1500 feet from the Le Roi, the Josie intervening. The claim was located in 1894, after the new law as to the size of locations came into force. The California is the only claim on Red mountain that is 1500x1500 feet. A good deal of prospecting work was accomplished by the original shareholders before work was closed down. A main tunnel has been run in 212 feet alongside of the ledge. To the east of the tunnel a 55-foot shaft and to the west a 56-foot shaft have been sunk, and in addition numerous prospecting shafts and tunnels have been sunk and run on various points on the surface.

Victoria *Times*: The Kimberley Con. M. Co., who own a group of claims on Sullivan hill, are working, a number of men being employed. Another shaft is being sunk on the vein. Development consists of a crosscut tunnel in 80 feet, two shafts 48 and 20 feet deep, besides several open cuts.——T. H. Violet, whose claim lies east of the Kimberley Con. property, has a body of pyrrhotite ore carrying gold, silver and copper. The vein is 5 feet wide.——The Carbonate, owned by Chisholm and associates, has had men at work the past month developing. The owners have opened up an ore chute 120 feet long, showing clean galena in all of the openings.——Dickman's property, the Black Bear and Mabel, one mile south of Kimberley, has a 3-foot vein of clean galena.——The Hastings Syndicate will develop their claims lying between the Sullivan group and the North Star.——It is said that the North Star people have thirty-five or forty men now at work on their property.——W. G. Mitchell-Innes, at Windemere, Mgr. New Golden Syndicate, intends developing the properties owned by the company.——Development has been resumed on the Pretty Girl mine, on Boulder creek, owned by the New Golden Syndicate.——Development work has been started on the Red Line group, situated on McDonald creek, and bonded from the original locators for $50,000, but since rebonded for $100,000.——The Sitting Bull group will be worked. It is under bond to R. R. Bruce for $30,000.

Nelson *Miner*: The litigation which has compelled the Molly Gibson mine, at Nelson, to cease work on that property has been settled, and nothing now but the labor trouble is in the way of active development. At a meeting of the directors it was decided to build a road and tramway and to put on a large force of men as soon as the eight-hour question has been settled, so as to allow the mine owners to ascertain their position. Several thousand tons of ore are reported in sight.——In the Nevada tunnel, at Ymir, they have struck 4 feet of solid galena ore.——On the Wilcox, P. White is working in two places, and also on the Fourth of July claim, taking out ore which assays $40.——At the Big Horn group Mgr. T. Woods reports that he is getting out ore for shipment to the Northport smelter.——On the Rio Grande C. Davis and his men are drifting on the ledge. This adjoins the Nevada and is owned by a Rossland company.

Spokane *Chronicle*: Rossland mines shipped to the Trail and Northport smelters during the week ending July 2 ore as follows:

To Trail—	*Tons.*
War Eagle	1560
Center Star	750
Evening Star	30
To Northport—	*Tons.*
Le Roi	1134
Total	3474

LOWER CALIFORNIA.

Los Angeles *Times*: The San Fernando, Peabody, Moromosa and Butler copper mines, the latter three owned by W. M. Freeman of Los Angeles, and the San Fernando by E. C. Humphreys and Mr. Brophy, are reported sold to A. H. Butler and M. S. Tweedie of the California and Oriental Steamship Co., who have resold it to Martin, White & Co., an English syndicate. The mines are said to be rich, one of them, the Peabody, being sixteen miles from the Sierra Pintada placers. The ore contains gold and silver.

MEXICO.

The Santa Rosalia M. Co., incorporated under New Jersey laws, with a capital stock of $800,000, owns a group of mines in the canton of Anthon, State of Jalisco. The principal office of the company will be in Jersey City, N. J. The directors of the company are Ex-Gov. J. T. Werts, J. A. Fitzpatrick, T. B. Adams, J. R. Joslyn, A. G. Macdonnel, W. A. Hoenig, A. B. Flint, J. Cooper, A. Coleman, J. F. O'Connell, A. T. Brennan and H. Henken.

(Special Correspondence).—At a meeting of the stockholders of the Cinco de Mayo M. Co. in Chihuahua on the 12th inst. arrangements for increasing the output of the mines were completed. These mines are in the Escondido mountains in the Sierra Madre country, and produce high-grade silver ore. Gen. Juan Hernandez of Chihuahua was re-elected president. A shipment of high-grade ore was sent to the El Paso smelter from the property this week.

Several Mexicans from Nacori, Sonora, recently discovered placer gold at the confluence of the Latachi and Aros rivers, twenty

WANTED,

An Experienced Amalgamator for Roller Mills.

None but experienced men need apply. Address "Experience," care Mining and Scientific Press.

WANTED.—BY A GRADUATE OF CASE School of Applied Science of Cleveland, O., a position as assistant mining engineer, assayer, or chemist. Best of references furnished. Address FRANK B. MARBLE, Bedford, Ohio.

WANTED, SITUATION

AS SALESMAN AND BOOKKEEPER IN MINING CAMP. Competent to take charge of store. Address S. E., this paper.

POSITION WANTED by an experienced cyanide man, assayer and chemist, preferably in charge of a cyanide mill. Speaks Spanish. Technical graduate. Can furnish a good assay outfit if desired. Address W. J. P., care of this paper.

Mining Superintendent, Assayer and Millman

of twenty years' experience wishes position. Eight years at last place. Best of reference. Address A. J., care Mining and Scientific Press.

WANTED—Second-Hand Huntington Mills,

3½ Ft. or 5 Ft. Must be in good condition. Send age and lowest cash price f. o. b. nearest railroad point, to L. Z., this office.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.

For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

WANTED.

20-STAMP GOLD MILL,

Complete with Power, Feeders, Plates and Concentrators.

Must be nearly new and in first-class condition. Give full particulars and price f. o. b. cars or steamer, or as it stands. Address "ALASKA," care of Mining and Scientific Press.

..CRIPPLE : CREEK..

FOR SALE—CYANIDE PLANT,

100 tons daily capacity; in first-class condition to handle Cripple Creek ores.

Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

GEO. S. BINCKLEY,

CONSULTING MECHANICAL ENGINEER.

Special attention given the Mechanical Equipment of Mines, and the Design of Power Plants, Compressed Air and Hoisting Machinery, and Head Frames.

528 HENNESSY BUILDING, BUTTE, MONTANA.

miles southwest of Guaynopa. One hundred and sixty claims have been denounced in the Guaynopa country within the last thirty days.

Another mining deal in the Casas Grandes district is being negotiated. The property is the Roy mine at Pilares, adjoining the Cinco de Mayo, the latter being the mine leased by A. J. King. The Roy is owned by McKim & Benton. The prospective purchasers are J. Q. Williams and L. E. Booker of Casas Grandes Neuva and partners in El Paso. It is understood that the purchasers took a lease and bond on the property several months ago at $200,000 gold, and have deposited $15,000 in the First National Bank of El Paso as a first payment, if the title proves perfect.

In the San Gregorious mine in Guanajuato it is reported a transverse vein has been discovered which assays 20 kilos silver and 500 grammes gold to the ton.

Mexico, July 18, '99.

The *Mexican Herald* says that W. A. Clark of Montana has bought for $35,000 gold the Sultana copper property, State of Sonora, and expects to operate it on an extensive scale.

NEW ZEALAND.

The dredging of rivers and streams in Grey Valley district has attracted attention, and claims have been taken up in various parts, with the view of putting on dredgers. Stillwater creek, from its confluence with the Grey river to Maori gulley, has been taken up and is being prospected. The Grey River Dredging Co. are making plans for a dredger to work their claim at Stillwater, the cost of which will be £25,000, and a dredger, costing $15,000, will be placed near the Little Grey Junction.

The Sulky Gully Water-race, which was subsidized by the Government, is 2½ miles in length and includes 545 feet of tunnelling. At the intake a dam has been built and the work has been completed.

SOUTH AFRICA.

The following figures are from the Directors' report of the Nourse Deep for the quarter ending April 30th, '99: Value per ton, 44s 1.298d; profit per ton, 12s 11.239d; costs per ton, 31s 2.058d; value of yield, £77,663 10s 7d; costs for quarter, £54,885 6s 9d; profit for quarter, £22,778 3s 10d; average stamps, 90; period of run, 81 1-24 days; tons milled, 35,215; recovered from mill, in ounces, 10,580.001; tons of sands and concentrates treated, 25,529; yield from cyanide, 7289.309 ounces; slimes treated, 9240 tons; slimes yield, 829.952 ounces; total yield, 18,649.262 ounces; per ton milled, 10.591 dwts. In all cases the ounces and pennyweights are given in fine gold.

Recently Declared Mining Dividends.

El Dorado mine, El Dorado county, Cal., $10,000; July 20.

Quincy M. Co., Michigan, semi-annual, $6 per share, payable August 15. The former dividend rate was $3.50 per share semi-annually.

Homestake M. Co., South Dakota, regular monthly dividend of 25 cents for June and an extra dividend of 25 cents, both payable July 25.

Hidden Treasure drift mine, Placer county, Cal., 10 cents a share, $3600; July 20.

Montana Ore Purchasing Co., Butte, Mont., $1 per share; payable July 27.

Boston-Aurora Zinc Co., regular monthly dividend, two-thirds of 1% on preferred stock, payable July 25 to stockholders of record at the close of business July 14, 1899.

Alaska-Treadwell M. Co., forty-first dividend of 37½ cents per share, $75,000; payable July 28.

Alaska-Mexican M. Co., nineteenth dividend of 10 cents per share, $18,000; payable July 28.

Recent Mining Incorporations.

McKittrick Petroleum & Development Co., San Francisco; capital stock $1,000,000; subscribed $25; P. B. Donohoo, W. D. Holum, R. H. Jones, J. A. Stephens, H. May.

Oakland Oil & Gas Co., Oakland; capital stock $300,000; subscribed $500; J. M. Merrell, J. T. Hamilton, W. J. Laymance, W. J. Dingee, C. H. King.

Pittsburg Oil Co.; capital stock $300,000; subscribed $500; J. M. Merrell, J. T. Hamilton, W. J. Laymance, W. J. Dingee, C. H. King.

Bonanza Con. G. M. Co., San Jose; capital stock $1,500,000; subscribed $500,000; W. W. Turney, R. W. Hersey, E. H. Wemple, N. I. Jordan, A. U. Chamberlain.

Columbus Development Co., Oakland; capital stock $50,000; subscribed $33,950; W. C. Root, W. J. Patterson, R. M. Clement, R. B. Myers, R. S Reed.

Brandt M. & D. Co., San Francisco, capital stock $100,000; C. W. Hawxhurst, S. W. Nicoll, F. J. Brandt, J. F. Simmons, G. M. Robertson, W. J. Smith, H. E. A. Rilton.

Oak Grove M. Co., Pasadena; C. Kestner, L. T. Chambers, Los Angeles; J. A. Shelhamer, H. A. Perkins, J. F. Eddy, Pasadena; capital stock, $400,000.

Like A Home In Oakland?

A nice home for your family in a choice part of Oakland. Good schools and churches. Forty minutes from San Francisco. Climate perfect. A cosy cottage built with special view to convenience for the owner's own use. Five large rooms and large, well-lighted attic and servant's room. Good laundry separate from house. Large grounds and fruit trees. Price $3500, or to rent for $25. Three adjoining lots very cheap. Easy terms. This is a very sunny, cheerful place. Address A. L. T., this office, or call at 1601 8th Ave., East Oakland. *

Mining and Metallurgy.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POSTPAID. Following is a partial list:

ASSAYING:—PART I—GOLD AND SILVER ORES.
Third edition; Rewritten and Improved by the Author, C. H. Aaron; 130 pages, illustrated....$1

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. Well illustrated. Cloth.....$2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. M. C. Ihlseng. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated..... ...$5

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall..... .....$2

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, etc.....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall.....$2

SKELETON MINING REPORT:
Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....50c

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus.....$3

PROSPECTOR'S FIELD BOOK AND GUIDE:
4th edition, just out. By H. S. Osborn.....$1 50

MINERALOGY:
Brush & Penfield, revised edition.....$4
Dana. 6th edition.....$12 50
Dana. for beginners.....$1 50
Dana. Mineralogy and Petrography, 12th edition.....$2

GEOLOGY:
Emmons.....$1 50
Le Conte, revised edition.....$4
Dana, 4th edition.....$5

IRON AND STEEL:
Thurston, 6th edition.... .....$3 50

LITHOLOGY:
Williams, 2nd edition.. ....$3

HYDRAULIC GOLD MINING:
Kirkpatrick..... .....$1

LIEBER'S CODE:
Bound in leather.....$3

METALLURGY:

INSTRUCTION IN
ASSAYING,
Chemistry, Mineralogy, Ore Testing and the Theory of Gold Milling.
A technical graduate with four years and a half of successful experience, just closed, as instructor in assaying at a leading mining college, intends to offer thorough courses of instruction, with full laboratory practice, in the above subjects, provided a sufficient number of inquiries are received within a month to warrant commencing courses during August, September or October. The instruction will be especially adapted (where desired) to those with previous practical experience in mining or milling but lacking scientific training.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: GATES IRON WORKS, Dept. UU, 650 Elston Ave., CHICAGO.

PATENTS

DEWEY, STRONG & CO'S

PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Blower Attachment with Pipe for either..... $30

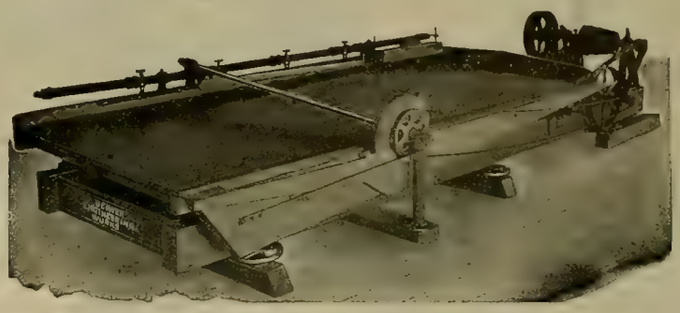
Also Four, Eight and Twelve-horsepower Whims.

THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt mach'nes.



Send for Catalog No. 14. RISDON IRON WORKS, Howard and Beale Sts. San Francisco, Cal., U. S. A.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : :

Thoroughly Protected by Strong Patents. Write for Circular.

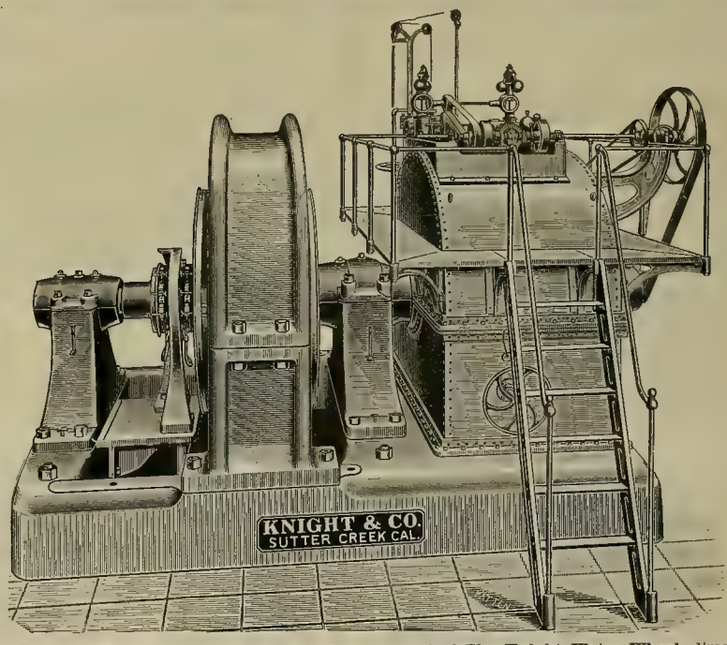
THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of wator powers by the most modern, economic and improved methods An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.



ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

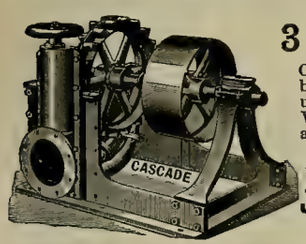
The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of **The Knight Water Wheel,** direct coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing.
These wheels are designed for **100 to 2500 H. P. Highest efficiency and regulation guaranteed.**
WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING.

Wheels for mill and reversible hoisting works a specialty.



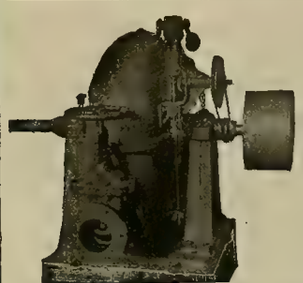
KNIGHT & CO., Sutter Creek, Cal.

For full particulars, send for descriptive catalogue.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.



Our experience of **33 YEARS** building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

Send for a Pamphlet of either Wheel and write full particulars.

Market Reports.

SAN FRANCISCO, July 20, 1899.

SILVER.—London, 27⅞d; New York, 60⅝; San Francisco, 60⅝; Mexican Dollars, 49¾@50¼; New York exchange, sight, 10; telegraphic, 12½ cents premium.

LEAD.—New York reports firmer, $4.40 bid, $4.65 asked; brokers' price, $4.35.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¼c; bar, 6.50c.

COPPER.—New York reports Lake unchanged at $18.50; brokers' price, $18.50; mill copper plates, 23¾c.

The copper market shows noteworthy strength and even at 18¼c there does not seem to be a sufficient supply to meet the strong, fresh demand. It is predicted that the price will go somewhat higher. The bearish tendency of European operators has to a considerable extent fallen short of the mark, and the foreign "bears" have run up against a stone wall in opposing the course of the copper market.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—15@16c per pound.

TIN.—Unsettled; $28.90 bid, $29.25 asked; pig, 31c per lb.; Bar, 35c.

The English market has recently boomed tin up to £120 15s per ton, with sales on Friday last of 1470 tons, which is an advance of £11 per ton inside of two weeks.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $43.50; export, $39.50@40; carload lots, special rates.

PLATINUM.—London, 63⅛s per ounce; York, $16.25; San Francisco, $16.75.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¼c; less than one ton, 15¼c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

CANDLES.—Electric Light Candles—6s, 16 oz., 8½c; 6s, 14 oz., 7½c; 6s, 12 oz., 5¼c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7½c; 6s, 10 oz., 6½c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

CHEMICALS.—Cyanide of potassium, jobbing, 32@33c per lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 4½@5c per lb.; borax, refined, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@1¼c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 14c; chlorate of potash, 25c; caustic potash, 12c.

OILS.—California Castor, pure, cs., $1.10 per gal.; bbl., $1.05; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.15; less than 200 gals., $1.10; in bbls., 4c per gal. less than case; Baker's Crystal, $1.40; China Nut, 50c; Linseed, strictly pure, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 47c; cs., 52c; raw, bbl., 45c; cs., 52c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 16½c; Astral, 16½c; Star, 16½c; Eocene, 18½c; Extra Star, 20½c; Elaine, 21½c; Water White, bulk, in tanks, 11½c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21c; 86 deg. Gasoline, bulk, 21c; do., cs., 26c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 20½c; Lard Oil, Extra Winter Strained, bbl., 52c; cs., 57c; No. 1 bbl., 46c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 70c; No. 1 bbl., 50c; cs., 52½c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

NAILS.—List per keg: No. 20 to 60d, wire $3.10; cut, $3.00; 10 to 20d, wire, $3.15; cut, $3.05; 8d, wire, $3.20; cut, $3.10; 6 and 7d, wire, $3.30; cut, $3.20; 4 and 5d, wire, $3.40; cut, $3.30; 3d, wire, $3.55; cut, $3.45; 2d, wire, $3.80; cut, $3.60. In carload lots, 10c per keg less.

FRESNO, June 25, 1898.

Hercules Gas Engine Works, San Francisco, Cal.—DEAR SIRS: The fifteen-horse power gasoline engine and hoist purchased from you is doing fine work and is perfectly satisfactory in every respect.

Yours truly, TUOLUMNE MOTHER LODE M. & D. CO. Per N. W. Moodey, Pres.

We have two large books full of testimonials; they speak better for the HERCULES than we can. Our works are the largest in the country. We have built and sold over 3500 engines; they are the standard everywhere. Any size up to 200 H. P. Stationary, Hoisting and Marine.

HERCULES GAS ENGINE WORKS, 305 MARKET ST., SAN FRANCISCO, CAL.

ELECTRICAL ENGINEERING COMPANY,

MANUFACTURERS OF DIRECT CURRENT MACHINERY

For Power and Lighting Purposes.

SPECIALTY

Direct Connected Electric Elevators.

Estimates Given on All Kinds of Mining Apparatus,

ALSO REPAIR AND JOB WORK OF ANY KIND.

Manufacturers of Fouts Patent Rotary Grip Wheel for Logging or Tramway Use.

509-511 Howard St., - San Francisco.

THE

"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

THE WM. POWELL CO., CINCINNATI, O.

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 1st day of July, 1899, and the day of sale from the 8th day of July, 1899, to SATURDAY, the 22nd day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to TUESDAY, the 1st day of August, 1899, and the day of sale from the 22nd day of July, 1899, to SATURDAY, the 19th day of August, 1899, at the hour of 2:30 P. M.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

ROSE CREEK MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 5th day of April, 1899, an assessment (No. 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1899, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMAMS, Secretary

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 3) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 3) has been postponed to SATURDAY, the 1st day of July, 1899, and the day of sale rom the 8th day of July, 1899, to SATURDAY, the 22nd day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 3) has been postponed to TUESDAY, the 1st day of August, 1899, and the day of sale from the 22nd day of July, 1899, to SATURDAY, the 19th day of August, 1899, at the hour of 2 P. M.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

BOULDER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of May, 1899, an assessment (No. 3) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of July, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 27th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California

SAILOR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of July, 1899 an assessment (No. 1) of eleven cents (11c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 318 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of August, 1899, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 18th day of September, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. C. LUND, Secretary.

Office—318 Front street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of July, 1899, an assessment (No. 14) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of August, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of September, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California.

The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of July, 1899, an assessment (No. 116) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 14, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on FRIDAY, the 18th day of August, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 7th day of September, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14, Nevada Block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

SILVER KING MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice.—There is delinquent upon the following described stock, on account of assessment (No. 21) levied on the 1st day of June, 1899, the amount set opposite the name of the shareholder, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Frances A. Sackett (N.Y. issue).	41	100	$25 00

And in accordance with law, and an order from the Board of Directors, made on the 1st day of June, 1899, so many shares of said parcel of stock as may be necessary will be sold at public auction at the office of the company, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California, on TUESDAY, the 8th day of August, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. PEW, Secretary.

Office—No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

DELINQUENT SALE NOTICE

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Eich Gulch, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 7) levied on the 7th day of June, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
C. Rehn	77	1,000	$50 00
C. Rehn	161	150	7 50
A. Rehn	176	250	12 50
G. F. Volz	85	1,000	50 00
W. G. Loewe	122	500	25 00
F. B Schuster	139	500	25 00
F. Woenne	154	1,000	50 00
W. F. Hatch	219	100	5 00

And in accordance with law, and an order from the Board of Directors, made on the 7th day of June, 1899, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 773 Mission St., San Francisco, California, on TUESDAY, the 1st day of August, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California. Office hours from 1 to 3 P. M.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogues Nos. 15 and 16.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

THE CALHOUN EXCAVATOR.

A COMBINED POWER-SHOVEL AND CABLEWAY. .....Ask for Circular.....

Cableways, Double Rope Tramways, Wire Rope Transmissions, Incline Planes, Logging Machinery, Suspension Bridges,

DESIGNED, FURNISHED, ERECTED. Write for Estimates.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

RAND ROCK DRILLS and Drill Mountings.

HIGHEST DEGREE OF PERFECTION ATTAINED. ∴ INDISPENSABLE IN MINING, TUNNELING & EXCAVATING.

AIR —AND— Gas COMPRESSORS.

Standard Types! Special Patterns! All Sizes!

CHROME CAST STEEL.

CANDA Improved Self-Locking CAMS.

TAPPETS, BOSSES, ROLL SHELLS AND CRUSHER PLATES.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. Morris Co.,

141 and 143 First Street, San Francisco, Cal.,

Pacific Coast Sales Agents.

Canda Cam.

THE BARTLETT CONCENTRATING TABLE.

One of these Machines will take the place of TWO or THREE Belt Concentrators of any make and do as good work.

Separates ALL the minerals from each other at one operation.

Gives THREE CONCENTRATES on the one Machine at the same operation.

The Machine is especially adapted to the separation of Zinc and Lead.

- PRICES: -

10-ft. Table, $300.

12-ft. " $350.

WEIGHTS .....1000 and 1200 respectively.

CAPACITY .....10 to 30 tons per 24 hours.

Next week will appear in this space an engraving of the new, latest improved BARTLETT CONCENTRATING TABLE.

TWO SIZES OF MACHINES ARE MADE.

Table B, 6 into 1 to 16 into 1.
Table C, 12 into 1 to 32 into 1.

Parties desiring tests made can send 500 lbs. or more, charges prepaid, and a run will be made and reports forwarded of the results, free of all charges, except for the assays, which will not exceed $10.00.

CAN BE SET UP ANYWHERE. REQUIRES NO SPECIAL FOUNDATION.

Licensee for the Manufacture and Sale, **PARKE & LACY CO.,** 21 & 23 FREMONT STREET, San Francisco, Cal.

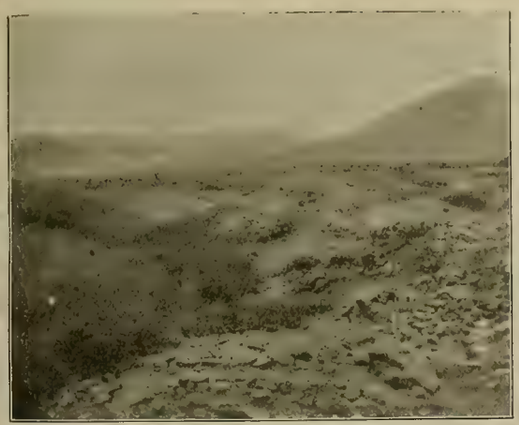
No. 2036.—VOLUME LXXIX. Number 3. SAN FRANCISCO, SATURDAY, JULY 15, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Necessity of Foresight in Mining.

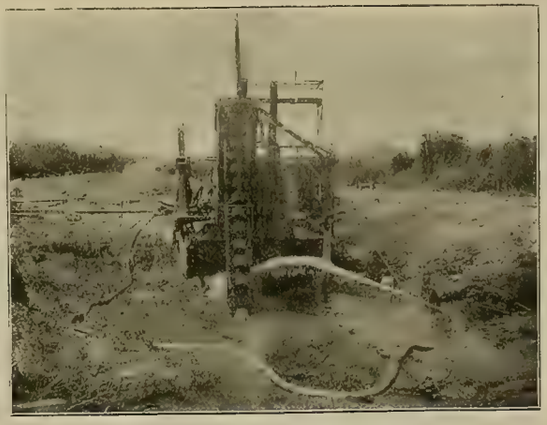
This is an age of progress, and particularly is it noticeable in the metallurgical field. The innovations in mining methods are more rare, for miners as a class are conservative—often too much so. The methods employed a century—yes, several centuries—ago are in many places still in use, and in certain instances these methods are good enough, but in others there is room for improvement. The introduction of a higher class of machinery is a noticeable feature, particularly in the newer mining regions. First-class machinery insures larger capacity, and this means economy. No one will dispute the statement that an engine capable of hoisting 1000 tons of ore in twenty-four hours is a more economical investment than one which will raise but 200 tons, if the ore is there to hoist. There is little use in putting a large, first-class plant on a prospect or on a mine in which development cannot be made which will permit the stoping of an amount of ore somewhere near the capacity of the hoist. Nor is it worth while to put in a hoisting engine which can develop a speed of 2000 feet per minute or more when the shaft will not admit of a greater speed than 200 feet. For rapid hoisting the shaft must be in first-class condition, and true throughout. A change in the angle of the shaft necessitates slowing down when the cage or skip passes that point. These facts demonstrate the necessity of sinking the best shafts possible, whether they be large or small, and also the need of opening a mine so thoroughly that there shall always be an abundance of ore available, that hoists and mills may work to their fullest capacity.

Cleaning Bedrock.

Dredging While Afloat.



Pit Pumped Out and Cleaning Bedrock.



Working in a Meadow 18 Feet to Bedrock

It is much more economical and profitable to open and work a mine out in a few years than to continue at it for half a century or more. This idea cannot be followed out unless the work of development be persistently carried far ahead of the extraction of the ore. The plan requires capital, and owners are often unwilling to invest such large sums when a smaller amount will accomplish the desired result. Haste to secure dividends is the great incentive, and when the mine is profitable on a comparatively small basis it can usually be made much more so on a broader plan of operation. If mine owners and operators would expend some of their first dividends in putting the mine in shape for large production they would find it far more profitable than to work in the small hand-to-mouth fashion so commonly seen. An inexpensive plant may be employed in prospecting the mine and may even pay a profit, but if exploration can be carried on more rapidly than the exploiting of the mine, a time will be reached sooner or later when a larger and more complete plant will be justified.

Recent Mining Incorporations; Recent California Dividends, 82.

WHILE there has been no general advance in the price of mining machinery, yet the increased cost of everything that requires metal of any description in its construction, foreshadows a proportionate increase in the price of all mining appliances that are kept up to the present standard of manufacturing efficiency.

CERRO PINTADO, Lower California, as a field for cheap gold is not given a very flattering recommendation by prospectors returning from there. They say the gold is there, but in such small quantity as to render its recovery too tedious an operation for one who has but a single life to live, and the gold fields are deserted by nearly all but the Mexicans and Indians.

DENVER, COLO., has a new stock exchange, starting afresh and freed from the odium that attached to some former ventures in that line. Rightly managed, a stock exchange may be of value to a State's legitimate mining interests, where the object is not to skin the unwary, but admit the speculative tendency to inure to the steady development of the State's mineral resources.

LEGITIMATE mining demands that a mine be worked thoroughly and systematically, but economic conditions do not always permit of working the low grade mineral at first. The advent of railways, a lower cost of materials, improved methods and cheaper labor often make it possible to work a mine at a profit, which, prior to the advent of these conditions, could only be worked at a loss. This has been repeatedly demonstrated in Western mining regions.

THE formation of a gigantic wrought-steel, iron tube and pipe trust is the largest thing of the kind this week. The creation of these modern Frankensteins is the most interesting of any present industrial feature. Great blame is attached by many public writers to those who form these trusts. To a looker-on it does not seem that those who surrender their individuality are to be blamed; they are simply doing the best they can at present. They really are the wisest. This paper thinks that those concerns that put in their plants and draw down ready cash are fortunate. For the crash is sure to come; the whole trust system is certain to go to pieces, and a large percentage of the properties that took trust stock in exchange will have to take their properties back again. Water can be forced up-hill, but its inevitable tendency is down again.

Why Mining is Safe.

Never at any time in the history of mining in America has there been such marked activity in that industry as now, and not only in America but throughout the world. Many rich districts have had their palmy days, when great excitement has followed the discovery of rich mines in new districts. The history of the pilgrimage to California in '49–'50 and succeeding years; the rush to Washoe; the stampedes to Montana, to the Black Hills, to Leadville, Cripple Creek, and a score of less noted places, is well known and remembered. These were typical rushes, by men of every nation in every condition of life. Rich and poor, strong and weak, saint and sinner, all hastened towards the goal of wealth. The present condition of the mining industry is in distinct contrast to those features which characterized the so-called rushes. Mining has of late years become to be looked upon as not only a legitimate but a safe business in which capital may be invested with as reasonable an assurance of success as may be found in any other business, and with a possibility of a far greater gain on capital invested than any other legitimate business affords.

There must be some good reason for this, for not so very long ago conservative business men considered an investment in any branch of the mining industry as extremely hazardous, and outside of mining circles in the Eastern cities of the United States a man who undertook to promote a mining enterprise, no matter how meritorious, was looked upon with suspicion if no worse, and the capitalist when approached by a miner would thrust his hands deep into his pockets as though to protect himself from being robbed. To-day some of the most conservative Eastern financiers freely endorse legitimate mining, and not only endorse it but are large investors in the best class of mining enterprises.

When the reasons for this change are sought, it will be noticed that the success that attends the most prominent mining enterprises is due largely, if not wholly, to intelligent, skilled and trained management. Men of large means have learned that anybody cannot successfully run a mining enterprise, and as the value of the services of scientifically educated and trained mining men became more fully realized, the greater became the confidence reposed in their judgment and skill, until to-day competent mining engineers are in demand and among the best paid men in the world. Numerous instances are of record where a graduated mining engineer with practical experience has succeeded a management which did not possess these requisites, and, though employed at a much larger salary, saved to his company from three to ten times the additional amount paid him for his services. With the leading mines in the hands of such men, capital no longer feels that it is taking an unusually hazardous risk when engaging in legitimate mining. Another reason why mining has come to be looked upon as a perfectly legitimate and, under proper conditions, safe business, lies in the fact that its requirements are better understood, and the mistakes so commonly made a few years ago are not likely to be made now, and will not be made if proper men are engaged to determine the kind of machinery to employ in mining and treating the ore. In the metallurgical field there is little ore which cannot be successfully treated by some milling process, and these processes are constantly being improved and cheapened. And here again appears the necessity of employing skilled men to determine which process shall be selected. Mining has made great advances in every branch, and the innovations and improvements resulting in success are largely due to the scientifically educated engineers.

THE operation of a mine is not unlike the conduct of any other business. If the operation pays with a 10-stamp mill, it will pay better with a 20-stamp mill or with one four or five times that size, if the ore can be mined rapidly enough to keep it supplied. It is a very unwise plan to neglect to provide a paying mine with a better class of machinery before the old plant reaches its limit of efficiency. In California there are a number of mines, at one time prominent and paying, which were shut down because the limit of the capacity of the machinery had been reached at a time when the ore in sight was mostly stoped out, and the manager was unable to sink deeper with the old plant. This illustrates the necessity of having the development work well in advance of the extraction of the ore. When this is done, the condition of the mine will warrant the installation of a new plant.

A Twentieth Century Enterprise.

Among the most noticeable new mining ventures now attracting attention is that of the Century Development Co. of New York, with a capital of $10,000,000, organized to operate mines in Tuolumne county, California. The splendid magnitude upon which this enterprise is to be conducted compels admiration. The company has secured a tract of land lying between the north and main forks of the Tuolumne river, near and including the Buchanan mine. They claim to have secured twenty-two claims and have designs on about 180 others. A large volume of water in the main river will be employed to run electric and other machinery. A mill of 1000 stamps, each weighing 1250 pounds, arranged to drop 110 times per minute, will give a capacity of 3000 to 4000 tons of ore daily. The boarding house is to be 300 feet square and will contain 1600 rooms. At first a small mill of 400 stamps will be built, the remaining 600 to be added later. The total estimated expense for mill, railroad, water power, electric machinery and other surface improvements is $2,500,000, which is provided for by an issue of 6% gold bonds, payable in twenty years, and secured by mortgage to the Knickerbocker Trust Co. of New York.

The above information is taken from one of the local papers, which credits it to the official prospectus of the company. Having a knowledge of the mining section included in the property of the company, it is thought the future career of the enterprise may prove to investors more interesting than prosperous.

As usual with these large enterprises no estimate has been made nor funds provided for developing the 200 claims of the company. At present it is doubtful if there is enough ground open in the entire district included in the company's property to keep a 40-stamp mill employed, though, perhaps, this is an item of small concern to the managers of the gigantic undertaking. The veins of the district occur in the slates, schists and limestones of the Calaveras formation, and are mostly of comparatively small size, ranging from a few inches to 4 feet, though in the Buchanan mine are stopes 20 feet wide in places. The Century Development Co. is well named, though a realization of its dreams more properly belongs to the end of the twentieth than the ninteenth century.

IN the Transvaal it seems that nothing but very radical concessions on the part of the Boers can avert war. President Kruger has been making preparations of a most warlike character, including the strengthening of existing fortifications and the construction of new means of defense, the purchase of abundant war material, etc., while England is not less active, the last step being the sending of several war vessels to Delagoa bay and the Cape, with a view to cutting off supplies to the Transvaal from the outside, though this step is taken rather too late to be very effective. Both England and the South African Republic seem thoroughly in earnest over the matter, and the large financial interests at stake in the gold mines of the Transvaal make the question more difficult of settlement. It is hoped the Boers will see the advantages which will result to them in granting the desired "reforms," for if they persist in refusing the demands made upon them the ultimate end may be easily predicted.

THE brief announcement on page 68 concerning the American purchase of Mexican bonds is of considerable significance, illustrating the advance of industrial Mexico, the unusual circumstance of purchase by United States citizens of foreign securities, and the international importance of this country's money market.

SEVERAL mining companies of the British Columbia region have apparently solved the labor problem to the satisfaction of all interested by operating their mines under a contract system. Each side feels they have made no concession, the miners are at work and trouble has been averted.

Concentrates.

CORUNDUM is an aluminous silicate; it is used chiefly in the manufacture of emery.

THE placer gold of Juarez, Lower California, is worth over $20 per ounce.

SOUTHERN COLORADO coal miners work eight or ten hours a day, at their own option. The pay is 26 cents per hour.

A FULL illustrated description of the "automobile" and its mechanism appeared in the issue of March 4th, '99, page 237.

WITH a pipe 4 inches in diameter, 4000 feet long, delivering 200 gallons per minute, 141 feet head is equivalent to the friction.

PIECES of oak wood—not bark—suspended in a boiler and renewed monthly are said to prevent a deposit of scale on the boiler.

THE mean or average velocity of a stream has been determined to be .81 to .83 of the maximum velocity in the center of the stream.

THE variation of the magnetic needle is different at almost every change in longitude. In California at present it is about 16¼°. This is not constant.

POWER has been transmitted a distance of a mile by steel rope for the purpose of pumping from a well nearly 100 feet deep to supply water to a mill near Calico, Cal.

THE bridge to be constructed across the Gokteik gorge, on the line of the Burmah railway, will be 1500 feet high at one point. It will be built by an American firm.

POSSIBLY the unsatisfactory cyanide returns reported by "Syphax" may be due to inferior quality. Cyanide of potassium must be of standard quality to insure satisfactory results.

IN the Hank Eller claim, on Green mountain, near Kimberly, B. C., an unusual mineral combination is reported, in the occurrence of galena and native copper in a quartz vein 6 feet below the surface.

THERE is a distinction between abandonment and forfeiture of a location. Abandonment is intentional and operates immediately; forfeiture is unintentional and results from non-compliance with the requirements of the law.

A BELT in a coil may be measured approximately by adding the diameter in inches of the hole in the center of the coil to the outside diameter; multiply the number of coils in the roll, and multiply the product by the decimal .1309, which will give the number of feet in the coil.

THE velocity of streams varies greatly on the same grade, owing to difference in volume of water, character of banks and bottom and the number of bends in a given distance. In a straight, smooth channel a fall of 3 inches in a mile will give a velocity of about three miles an hour.

IN Honduras placer gold can often be purchased at the rate of eleven to fourteen silver dollars per ounce from the miners who wash it from the stream. This is only about one-half its value, owing to difference in exchange, but it is difficult to find any considerable quantity at any one place.

WITHIN two years California will have mines over 3000 feet in depth. There are several shafts now down to the 2000-foot mark, or near it, and some below it. When the new Kennedy shaft in Amador Co., Cal., reaches the proposed depth of 3500 feet, it will be about 2000 feet below the level of the ocean.

THE Selby Smelting & Lead Co. of San Francisco has made reduction in refining charges on gold bullion corresponding to the recent reduction in mint charges, making their rates the same as those of the Government. The main reduction is from 6 cents to 4 cents per ounce on bullion 700 fine and over.

NO DAM should be constructed without having a sluice provided in the channel of the stream by means of which the reservoir may be emptied, which is sometimes necessary for various purposes, such as cleaning out, making repairs to the dam, recovering articles of value dropped into the reservoir, etc.

WHEN the right to follow the dip of a vein outside of the side lines of a claim is challenged the owner must establish the existence of an apex within his boundaries, to the extent necessary to cover the disputed segment of the vein and also the identity and continuity from its top or apex within his own boundaries to the point in dispute.

AS TO "libelous" matter published about mines or anything else, it may be said in a general way, that the truth is not libel unless accompanied by malice. The journal referred to did not "libel" the property, though it might have stated the facts in a less exasperating way. In these things Davy Crockett's advice holds good—"Be sure you're right: then go ahead."

THE railway train carrying the delegates to the 77th meeting of the American Institute of Mining Engineers in San Francisco is scheduled to leave New York, Sept. 14th, Chicago, Sept. 16th, thence via St. Paul, Minn., Butte, Montana, and Portland, Or., arriving in San Francisco, Sept. 24th. It is expected that 150 or 200 members of the organization may attend the meeting.

A LIST of the cyanide plants in California is not at present accessible. "The most recently erected cyanide plants in Nevada," so far as this office knows, are a forty-ton plant contracted for in San Francisco last week by Logan & Holley, Dayton, Nev., and a ninety-ton plant to be put in at the Chainman mine near Ely, Nev., to work the tailings recently experimented on by T. T. Lane.

AN alien cannot locate a mining claim in the United States unless he declares his intention to become a citizen thereof, when he has the same rights as a citizen. An alien, however, may purchase a mining claim from a citizen locator, and hold the same until the fact of alienage is authoritatively established by a public officer, upon an inquest held at the instance of the Government.

IN some instances Congress has opened forest reservations for the location of mining claims. The Pike's Peak, Plum Creek and South Platte forest reservations in Colorado are included in this exception. Mining claims duly located and held prior to the creation of forest reservations, and included within the limits of such reservations, are excepted from the force of the proclamation creating such reservations.

THOSE who contemplate engaging in mining who have had no practical experience would do well to employ some competent and reputable mining engineer to assist in the enterprise, to outline the development of the mine and determine the character of machinery and the process to be employed at least. Inexperience and self reliance have proven very expensive to some investors in mines in California and elsewhere.

THE throw of faults is not always at a right angle to their strike. Very frequently there is a lateral as well as a vertical displacement, and this fact may result in deceiving the miner searching for the continuation of a faulted vein, for where the vein is found of the opposite side of the fracture it may not have, on the same level, the same width and other characteristics, in which case it might be mistaken for another vein.

IT is thought that the most effective antidote to cyanide poisoning is subcutaneous injection of a 2% solution of peroxide of hydrogen. Dr. Loevy suggests that in every cyanide plant provision for the administration of such antidote be made by having, say, a half-ounce of pure peroxide of hydrogen in a small, tightly-corked bottle, kept in the dark, with suitable hypodermic appliance, accessible for immediate use if required.

SOME of the volcanic channels of the ancient river system of California carry gold in paying quantities. By volcanic channels is meant channels in which the wash is almost wholly made up of boulders, cobbles and gravel of volcanic material. The gold in these channels has been derived from the veins occurring in the bedrock of the channel or more frequently from a pre-existing channel which the later channel has cut in its course.

A WING DAM is one which extends only partly across a stream and is employed to divert a portion of the water. When it is desired to mine a low bar or portion of a creek bed the wing dam is sometimes resorted to, inclosing the portion that it is desired to make accessible. The dam is then built parallel with the bank of the stream and is connected with the bank at the up-stream end and sometimes also at the lower end. The water in the inclosed area is pumped out and mining proceeds usually by the sluice method.

THE Secretary of the Interior has reversed the decision of the General Land Office regarding the claim of the Mayflower G. M. Co. to the Beaver Springs placers Nos 1 and 2 and the Mayflower and Highland Chief lode claims in Colorado. These claims are contiguous. The land office held that the company could not secure a patent for both placer and lode claims and directed that they retain one and the entry to the other would be cancelled. The company appealed, asking that its entry as originally made for all three claims should stand and be passed to patent. The Secretary has considered the appeal and ordered that the entry be passed to patent as requested.

IN torrential streams where the range of flow varies from a rivulet to a torrent, bank full, a cheap dam which washes out with every flood is about as economical as one calculated for permanency, for streams of this character when up usually carry a large amount of debris, which would quickly fill a reservoir of ordinary character when the purpose of the dam is practically destroyed. A very serviceable dam may be constructed of a cribbing of logs, brush and earth, which may be replaced after a flood. In some cases the larger logs are secured to the bank by chains or cables and are thus prevented from being washed down the canyon, and may be used in reconstructing the dam.

GREENSTONE includes the several varieties of diorite and diabase. Diorite is not always green. Some diorite is much like granite in appearance, particularly the quartz-mica diorate. It is coarse to fine grained and presents a great variety of phases. Diabase is usually green varying in color from light pea green to dark green and almost black. The greenish color of rocks of this class is due to the occurrence of a large amount of fine particles of chlorite throughout the mass of the rock, the chlorite being derived from alteration of the hornblende or augite. Phonolite does not properly belong to this class of rocks, being more nearly related to the trachites.

THE subject of county mining bureaus for the various mining States has been referred to herein before. Each county should take steps to make a typical collection of its valuable ores, rocks and minerals and place them on exhibition in some suitable public place at the county seat. When expositions are held, such as that to be opened at Paris next year, the best of the collection could be boxed, shipped to the exposition and returned when they were no longer required. Once established miners and mine owners would soon take pride in it and frequent additions would be made to it, and the natural result would be in time that each county would possess the best possible exhibit of its mineral resources, collected at the least possible cost and it could not fail to become a source of both pleasure and profit.

"YOUR paper is a positive necessity to miners," writes a southern California subscriber, sending the subscriptions of two others at the same time. "I get enough from any one issue to pay for the whole year," says a Butte, Montana, reader. "It has no superior in the mining world," writes a Kalgoorlie, Australia, subscriber. "The MINING AND SCIENTIFIC PRESS is the only paper that has the real mining flavor about it," is the comment of a Colorado mining superintendent. "I only wish that all my investments were as profitable as the money I pay for the MINING AND SCIENTIFIC PRESS" is the way a Hedges, Cal., subscriber puts it. Such plain praise from practical men is a positive pleasure; many such letters are monthly received and always appreciated, as is adverse criticism on sins of omission and commission, from which no publication is free.

THE Supreme Court of California has rendered a decision determining what constitutes valid assessment work. It says: "A party cannot hold a mining claim for several years without doing in any year the work required, by simply going on the ground at the beginning of each year and doing a few hours' work, with no bona fide intent to comply with the statutory requirement as to the amount of work to be done. It is against the policy of the law to hold quartz claims by merely doing a few dollars' worth of work thereon at or near the beginning of the year next following the year on which the claimant failed to do the necessary work, when such work is not commenced with the bona fide intention of being continued till the full amount is done. Such labor so done is a mere pretense and a sham, and will not prevent the relocation for want of necessary work."

THE requirement of annual labor on unpatented lode and placer locations is imperative. A timely resumption of work may save a forfeiture, if completed, the law contemplates that it shall be completed and if it is not the claim is still subject to relocation for non-compliance with the law. The law is certainly liberal as it requires the work to be done within a year from the first of January next succeeding the date of location, so that a claim located on the first day of January, 1900, may hold good under the present law until Dec. 31, 1901, when it would be subject to relocation by reason of failure to do the required work. Practically the law gives on the first annual expenditure from about one to two years in which to do the work, and one year for the performance of each additional $100 worth of work, yet there is probably no part of the law which is so much abused and evaded as this very liberal provision.

THE terms strike and dip, as referred to veins, have been judicially defined as follows by Judge W. H. Beatty: "The strike, or course, of a vein is determined by a horizontal line drawn between its extremities at that depth at which it attains its greatest longitudinal extent." The dip of a vein, its course downward, at right angles to its strike; or, in other words, if a vein is cut by a vertical plane at right angles to its course, the line of section will be the line of dip. The strike, or course, of a vein can never be exactly determined until it has been explored to its greatest extent; but a comparatively slight development near the surface will generally show its course with sufficient accuracy for the purpose of a location. The dip having an exact mathematical relation to the course of the vein, is, of course, undetermined; but practically the line of dip is closely approximated by taking the steepest (nearest the vertical) line by which the vein can be followed downward.

A locates a placer claim by simply placing his notice on a stake at the head of the location, claiming a certain number of feet down stream together with 300 feet on either side of the center of the stream, and sets no other stakes or monuments, and no natural objects being used to define the boundaries of the claim; he records his claim and does the assessment work; B subsequently locates the same ground by properly staking boundaries of claim and otherwise complying with the laws: does A lose his rights to the claim? The question is, Did A make a valid location? Apparently he did not, as the United States laws require all locations to be distinctly marked, that the boundaries may be readily traced on the surface. This A failed to do. However, had A made his location under the law of California repealed March 20th, '99, that law gave him thirty days in which to perfect his location. If he did not perfect his location within that time it would not have been a valid one, and if made since the repeal of that act it would not be a valid location.

FOR the convenience of cheap and expeditious handling of ore and waste on the various stations of a shaft, excavations are cut out under the floor of the level, sloping toward the shaft and substantially timbered. In the case of an inclined shaft these ore pockets are made in the hanging wall side of the shaft. The ore pocket or bin thus formed is provided with suitable chute, and the skip or bucket is lowered to the proper point and the ore or waste discharged into it. The arrangement is essentially the same as that provided at ore bins on the surface. A space must be provided below the level upon which a man may stand while loading the skip. In shafts having a small inclination from the vertical, cages built to suit the particular angle of the shaft are frequently used, but skips are in more common use, though where practicable cages are to be preferred as it obviates the necessity of dumping and reloading rock: the car loaded in the mine may be sent to the surface. In shafts having steep inclination guides should be provided, whether skips or cages be used, as skips are very likely to become overbalanced and leave the track, when much damage may result.

HAS the proprietor of a regular valid lode location the right to pursue his vein in depth, outside of his lateral bounding planes, into and underneath the surface of an agricultural grant, the title of which grant passed to the grantee prior to the discovery and location of the mining claim enclosing the apex? The question has never been determined by the Supreme Court of the United States, but has been answered in the negative by Judge Sawyer, in the ninth Circuit Court in the case of Amador-Medean G. M. Co. vs. South Spring Hill G. M. Co. The case was appealed to the Supreme Court of the United States, but before it came on for argument both properties in the suit has passed into the hands of the same persons. In "Lindley on Mines," the author fails to agree with the decision of Judge Sawyer. He says: "The land covered by an agricultural patent is conclusively deemed to be agricultural, but this does not necessarily imply that a lode under its surface, apexing outside of it, cannot be reserved without impeaching the patent and changing the legal character of the land. The two classes of grant may exist without conflicting in a legal sense."

THE latest ruling of the Commissioner of the General Land Office regarding mining claims is that when a mining claim has been surveyed and patented in accordance therewith, the land described therein is disposed of so long as the patent is outstanding, and the jurisdiction of the department in regard to that particular tract is terminated. It therefore follows that land thus patented cannot be properly included in a subsequent patent, merely because years afterwards a deputy mineral surveyor in making a subsequent survey reports to have found the true corners of the old survey to occupy a different position from that reported in the survey which was the basis for patent of the old claim. And the same thing is true as to reported discrepancies as to the length and courses of lines of prior approved surveys. Where such a state of things actually exists, the owner of the new claim applied for, who desires to include an area in his claim conveyed in a patent of an older claim, which as a matter of fact is not embraced in the lines of the old claim, as staked upon the ground, should procure the surrender of the old patent by the proper method—through the courts, if necessary—and then show in a new patent of the old claim its true position as staked, and thus eliminate from the patent the areas desired not in conflict.

Gold-Bearing Gravels of the West.*

In the Rocky Mountain and Pacific Coast States there still remains a very large amount of gold-bearing gravel which has never been disturbed. Most of the land on which these gravels are located can be acquired, at the present time, at little cost. Much of it is close to railroads and civilization, a large part is in a semi-arid region where the rainfall is light and the streams few and small, and the season is short in which the placer miner can get an abundance of water for handling large quantities of gravel.

DREDGER AFLOAT AND STRIPPING BANK.

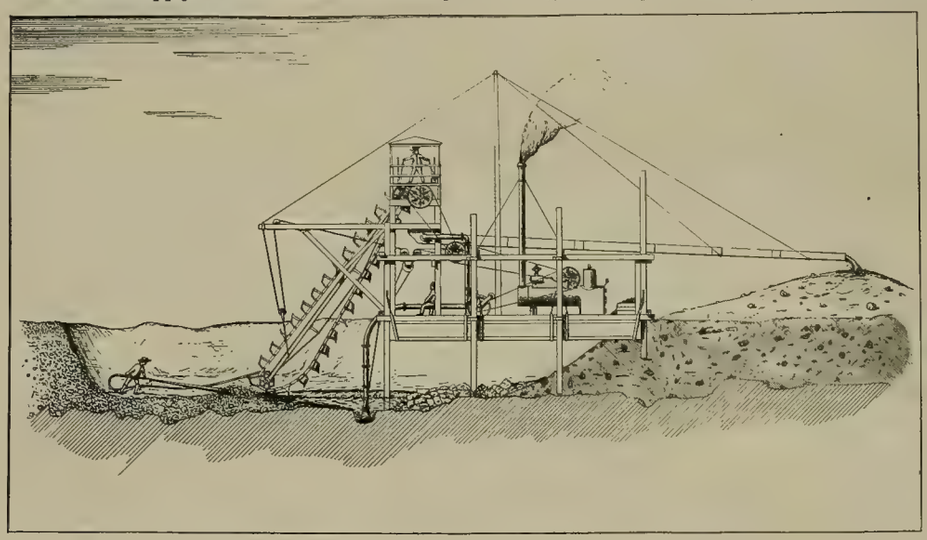
In the placer region, generally, attention is given to the possibilities of gold in the gravels of existing creeks or rivers, or the bars and benches close by, and this is usually as far as the prospector or miner has gone because of the want of sufficient water. There are many plains and valleys away from the watercourses of to-day that were formerly the channels and beds of rivers that changed from time to time as the mountains and hills crumbled, and the streams have now disappeared. There are many such places, where a small stream of water may be forced up to them or drawn from a higher elevation to run some mechanically operated plant. Some of the richest finds in gravel have been on high bars or bench lands, and if some plan of reusing water and working on level ground were adopted pay streaks away from the creeks and rivers of to-day will be found.

There are great flats or meadows in the valleys and old watercourses that were too wet for the early miner which give evidence of pay on bedrock. There is also much flat land containing gold, but not water enough available to work with past methods.

Placer gold in nearly all gravel formation is close to or on the bedrock, particularly so if the gold is coarse, so that in gravel formation that may be 10 to 20 feet deep, 95% of the gold may be found in the lower foot of the gravel and in the crevices of the bedrock itself.

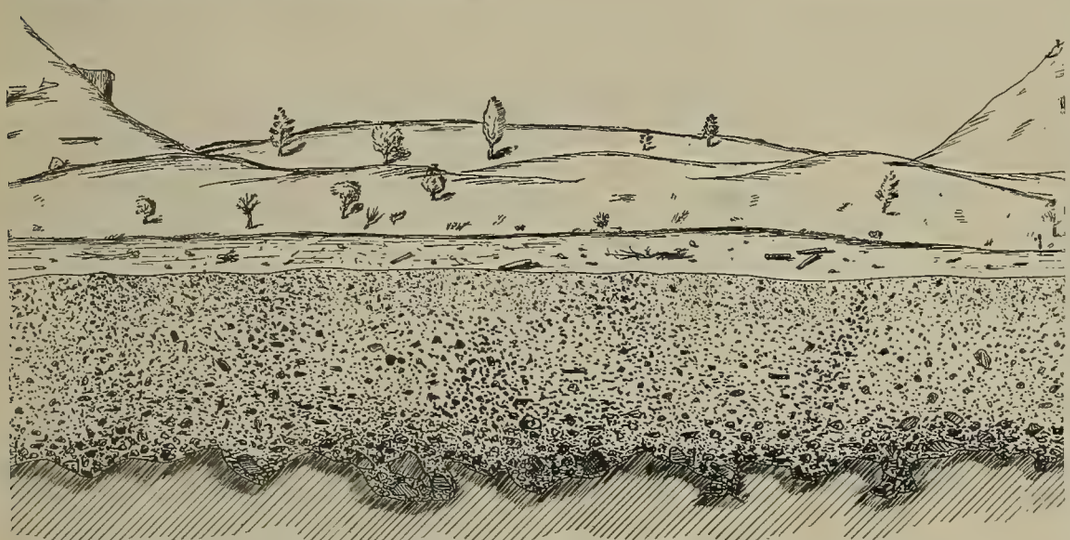
It is sometimes the case that the bedrock consists of a variety of soft, or decomposed, stone, but in nearly all cases it will be found to be mixed with hard and ragged spots, and often it is a hard, slaty formation; but it is generally uneven and full of crevices, and forms the riffles that have caught and held the gold, much as illustrated in the ideal cross-section of bedrock.

Montana Bar, Confederate gulch, thirty miles from Helena, Mont., was one of the richest spots ever found there. It is said four men took out $1,200,000 in 100 days from about three-fourths of an acre of gravel. The bedrock was rough, ragged and hard, and, from a description of how the gold was found in the crevices of that hard rock, no dredger could get the gold on such bedrock, if covered with water. In other camps the richest spots are generally those on hard, rough bottoms, where the gold has to be picked up by hand out of the crevices with small tools, such as knives, spoons, etc.



The same would apply to old channels which may now form the dry bars, the meadows, valleys or bench bars that at some time formed the bed of a river.

By this view of bedrock, it will be seen how difficult it is for any dredger to get most of the gold without some other means of cleaning the bedrock than simply dredging. There are instances where good dredgers at work in creek bottoms did not secure 25% of what the ground by careful tests prospected. In New Zealand the gravel and bedrock are unusually favorable.



The placer miner, where he has plenty of water and sufficient fall, makes a bedrock flume and cleans off the bedrock by hand, or uses a stream of water, until he gets nearly all of the gold out of the bedrock crevices. The early prospector and placer miner was not able to work on ground that was flat, where the gravel contained great quantities of water, nor in dry, flat ground not rich enough to drift; or far from water, because of the amount of labor and expense. The same is applicable to rich ground which had fall enough, but little or no water.

DREDGER ELEVATING GRAVEL AND DISCHARGING TAILINGS 400 FEET AWAY.

WORKING WHILÆ AFLOAT IN THE CREEK.

IDEAL SECTION SHOWING ROUGH BEDROCK.

Some attention has been given to gravel mining by the machine maker, but ordinarily the miner is not familiar with mechanical appliances, and the mechanic is usually far from the mining regions and has not familiarized himself with its requirements. There may be some gravel formation where dredgers will not work, and there is rich ground where a dredger and combination can work to advantage and yield profits.

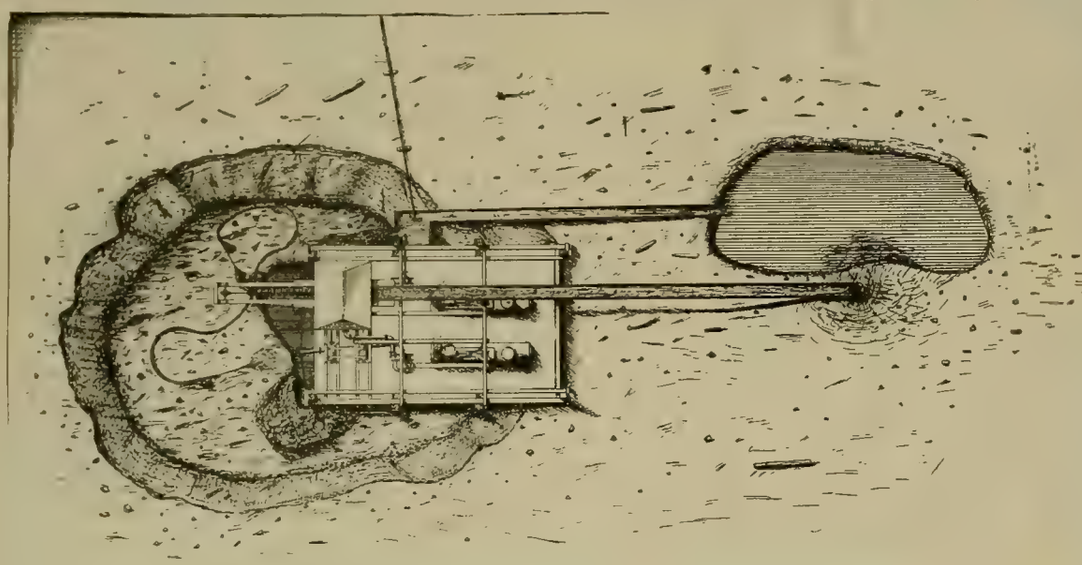
The McDougall plant consists of boilers and engines; a large centrifugal pump, with pendulum suction pipe, which raises water to sluice and also lifts sand, gravel, gold, etc. This pendulum drags back and forth and rubs off the pieces of stone too large to enter the suction pipe, and at the same time wears a hole in the rock, particularly if it is soft.

There is an elevator leg or ladder dredger which lifts the sand, gravel, gold, water, etc., depositing it in the hopper into which the large centrifugal pump discharges its material. The hopper is connected with a sluice which is high enough to carry the ma-

* Condensed from "Placer Gold," by Alexander McDougall, Duluth, Minn.

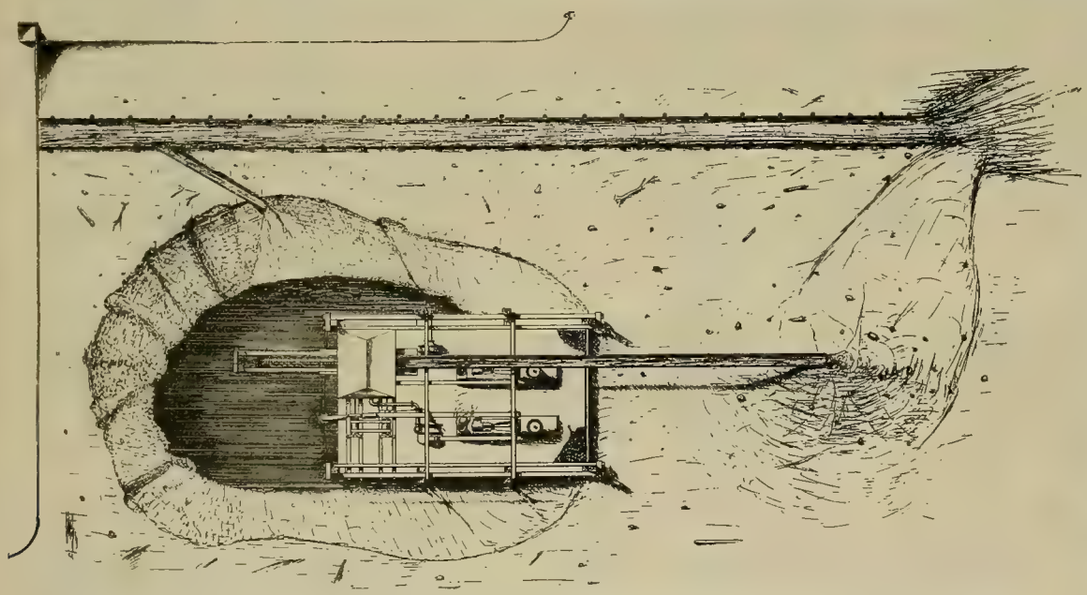
terial back when the scow is part way down in the pit. There is a reversible hoisting engine which operates the pendulum, and also hauls the scow about when afloat.

A second centrifugal pump, smaller than the first, can be used to assist the large pump to flush the sluice box, but its chief use is to force jets of water, when the scow is afloat, against the gravel at the lower end of the elevator to loosen it, or, when the pit is dry, it is used, through hose, to push the gravel to the elevator or pendulum suction, and also to clean the bedrock of gold in the crevices, which cannot be cleaned up otherwise.



In a meadow alongside a creek, where there is 20 feet of gravel on the bedrock, a hole is dug a couple of feet deep, large enough to float a scow. The machinery and sluice boxes are placed, and water from the creek turned on and the machinery started; a larger and deeper hole will soon be excavated in which the scow can float, the sluice extending far enough astern to dump clear of the pit. This continues until the pit is 50 feet wide and 60 feet long, and dredged close to bedrock.

The scow, which has adjustable legs, or spuds, is lowered into the pit, by shutting off the water supply and pumping out the pit until nearly dry; the scow will then rest on its legs, the after part resting on the bank, and by large screws attached to the legs, the scow is leveled to suit the after end of the sluice box extending back of the scow so that the water and tailings do not run into the pit. Water is turned into the pit to supply the large centrifugal pump, the small pump receiving its supply from the creek.



When the bedrock is free of water, a part is cleaned; the large stones, usually found on the bottom, are piled up, and after the first shift can be thrown under the scow, for the new ground will be nearly all ahead of the scow. When bedrock is nearly all cleaned in this pit a spot is selected for the sump, where the pendulum suction is located for the next shift, usually the lowest spot which can be secured, on soft bedrock where the pendulum can work its way down to get a deep sump. When necessary, a deeper hole is made with a small charge of powder, so that water can be kept out when cleaning bedrock.

When the bedrock is cleaned, and the sump is located, the scow is floated and moved ahead. After the first pit has been made, it is easier to excavate, or extend it, as the dredger can be worked against the bank. Always work up stream, if ever so little fall, so that water and tailings will work away from the scow. After the first hole is dug, the tailings are dumped in the last pit.

The discharge of water, sand and gravel from the big pump and elevator dump into the same hopper, which in the fine gravel does not require a screen, but if the gravel is coarse, a bar screen can easily be made; and in a large plant a revolving screen may be necessary. Where there is little water this dredger can work to advantage by allowing the water to run back in the pit for the purpose of using again.

DREDGER WORKING WITH SMALL SUPPLY OF WATER FROM RESERVOIR.

LARGE WATER SUPPLY FROM CREEK AND RETURNING FROM TAILINGS DUMP TO CREEK.

ONE is tempted sometimes seriously to wonder whither the present flowing tide of diamond discovery will carry that branch of the South African industry. During the past few days specimens of blue and yellow ground have been shown, affording every indication of being diamondiferous, from a region of South Africa hitherto virgin as far as these gems, or as metalliferous mining, are concerned. As there is evidence that the actual discovery of diamonds on the surface led to this blue and yellow being located, and as the samples afford the clearest indications of pipe matter, there is likely to be an increase in the already considerable embarrassment of these riches. —South African Mining Journal.

THE first year's work in Cornell's unique hydraulic laboratory has been marked by the completion of an important investigation, for the U. S. Deep Waterways Commission, of the flow of water over dams of various contours. Nothing was known of this, heretofore, and the resulting information enabled the Commission to reduce their estimates for a ship canal from the lakes to the Atlantic by $10,000,000 or so in a single item—the feeder on the Rome summit. Cornell is in a way to save Uncle Sam more than he has given her.

Some Experiences of a Working Miner.

NUMBER XXIV.

Written for the MINING AND SCIENTIFIC PRESS.

The L—— Borax Company had a splendid thing of it some years ago when they found a lake bed, practically dry, in the mud bottom of which they found large quantities of borax in crystals. They dug up, cleaned and sold this mineral, realizing a handsome profit; but cupidity resulted in their undoing. Not satisfied with making about 1000% per annum on their investment, they wanted to increase the income a hundred fold and perpetuate it. Accordingly, they rigged up a well-boring outfit, sunk a 10-inch hole and struck water. They had expected to strike water, of course, that being the object of drilling the hole, and they thought the water would prove to be a saturated solution of borax; but it was fresh and it flowed out in abundance. The fresh water filled the lake bed, dissolved all the crystals and put an end to what had been a profitable business.

* * *

Speaking of well boring, brings to mind the experience of Mr. H—— at P——. He concluded to sink a well and was advised to drill a hole, as he could get artesian water and save the expense of pumping. After the rig was in position and drilling had commenced, I went out to look at it. The drill was cutting its way slowly through gravel and boulders. Mr. H—— asked me what I thought his chances were to find artesian water. I told him I did not consider them good, for the reason that I believed the gravel to be underlaid by crystalline rock, in which he need not expect artesian water. I told him I would come again when the drill had passed through the gravel. A day or two later Mr. H—— came and asked me to ride out to his place and look at the stuff coming up. It was a coarse gneissoid rock, and I again told him he would do well to abandon the proposition and sink a well of the ordinary kind, put in a windmill, etc. He told the well-boring man what I had said, and his remarks were not at all complimentary. He persuaded Mr. H—— that he knew his business—that of boring wells—and assured him of the success of the undertaking. The well borer continued work; at 90 feet he struck water. The bore was put down over 1000 feet, but the water never rose an inch above the 90-foot mark. Gratuitous information and advice is rarely appreciated. A bit of advice in exchange for a good round price is much more effective, and it will usually be followed whatever the result, simply because it cost something.

* * *

A mill man of my acquaintance told me of a little experience he once had with a visitor at the mine when he was head amalgamator. The visitor was interested in the property and asked a great many questions, some of which were not pertinent—at least the mill man did not feel called upon to answer all of these questions; still, as the company was a corporation, he did not wish to offend a prominent and influential stockholder and a director. The visitor came into the mill and looked the outfit over with much interest. The clean-up had just been made and there was a goodly pile of amalgam in the retorts. The stranger was more interested, apparently, in the result of all this operation than in the operation itself. He innocently inquired:

"How many dollars do you think we should clean up next month, Mr. M——?"

Now, M—— knew perfectly well he had no right to answer a question of this kind, as his position was of a confidential kind, as you may say, and still he didn't want to appear rude and give offense. He studied a moment and then, looking very earnestly at the inquisitor, replied:

"I think, if we can get through about the same amount of ore this month as we did last month, and if the ore runs about the same, we ought to clean up about the same as we did last month."

The director stood and stared at M—— for a bit, seeming to be unable to comprehend his stupidity, but finally said:

"You do not understand me, Mr. M——. How many dollars will we get?"

M—— replied that he thought perhaps the superintendent could give the desired information, and the director took the hint and consulted the superintendent.

* * *

At one time the P—— E—— mine was a great concern. Month after month it poured forth a golden stream, but in time the ore in sight diminished, and desperate efforts were made to find new ore bodies. Most of these desperate efforts were

made in the home office of the company by the board of directors, who, with a map of the mine spread out on a large table, theorized where ore should be found and where it should not. The superintendent had some ideas himself, and informed the company of his belief that, by crosscutting in a certain direction, new ore bodies would be encountered. For a time his suggestions were opposed, but, finding nothing in the directions they themselves had selected, they finally gave the superintendent permission to run his crosscut. The work was started and did well for a time, but after awhile the rock became hard and progress was slow and expensive. Finally they gave orders to discontinue this work. Much to his dislike, the superintendent gave it up, and not long after died, but still maintained to the last his belief that ore would be found by driving his crosscut.

A new man took charge, and after a time he concluded that ore must lie off in the direction of the crosscut. He started the old crosscut once more and reported the fact to the company, who promptly ordered him to discontinue the work and gave directions to prosecute work in various other places, equally unpromising. Instead of obeying orders, this man continued the crosscut, omitting to mention the fact in his report. In less than a month he struck an ore shoot which produced millions, and without which the mine would probably soon have been abandoned.

* * *

Shortly after the G—— H—— mill was built I chanced to pass that way and took advantage of the opportunity to look in and see how things were done in that establishment. Twenty stamps were dropping, and the screens were rather coarse. The ore, which was of good grade, contained 2% or 3% auriferous iron sulphide. There were eight concentrators in the mill but none of them were in operation. I wondered at this and ventured to inquire of Mr. G——, the mill foreman, why he didn't run the concentrators. He replied that he was short of water and could not run the machines and do good work. I suggested that if he should hang up ten stamps perhaps there would be enough water to run the other ten and four of the concentrators. He could not see it in that way for the reason that it was very desirable to run the mill to its fullest capacity in order to work economically. There were sixty-five men on the payroll (forty would have been more than a full crew) and to hang up ten stamps would throw at least thirty men out of a job and he hadn't the heart to do it. Well, the usual result followed. The mine was shut down, didn't pay, and was given up as a bad job. Now the mine is paying all right and the tailings are paying, too,—the same tailings that were being sluiced through the screens to get large capacity.

* * *

At the S—— H—— mine I sat one day on a pile of round timber and watched two men frame a post for a timber set. The stick was about 6 feet long and 20 inches in diameter. They rolled it over several times, sizing it up and making up their minds where it would saw out with greatest ease. Having finally settled this important matter, they spent some time in marking off the several cuts they were to make, and at last took a 5-foot crosscut saw and went to work. When the job was finished it had been fairly well done and had taken them just forty-five minutes. One of the two workmen approached me, mopping his brow, and said, "Hard work."

"Yes," I replied, "that was a pretty hard, and, I should think, a very particular job."

"Particular, partner!" said he, "well I should say so. Ever see how such timber looks under ground? You would think it was particular if you could see it. Why, men's lives depend on it."

"Is it possible?" I asked. "I was thinking as I sat here," I continued, "how nice and easy it would be to have a gang saw here and cut that post out and have it all finished in less than five minutes."

He gave me a withering glance and walked away.

This mine employed a large number of men, more, it seemed to me, than was necessary, by half, but the above illustration is a sample of the way in which everything was done there.

MINER.

The Patio Process in Guanajuato, Mexico.*

By ROBERTO FERNANDEZ, M. E.

Want of knowledge on the part of experts from abroad respecting the amalgamation system known as the Mexican or patio process has been the cause in this country of trouble to many foreign mining companies. This process has not been looked upon by their managers as a satisfactory method of treating silver ores, and they prefer to employ others, which, although more modern, and often more profitable in other countries, have not proved to be so under the exceptional conditions of this country, where labor is cheap and paid in silver, while fuel is very dear. The cause of this error of judgment is probably the inexact information which has been furnished by several authors respecting the economical results of the patio process.

This treatment is not suitable for silver ores of every kind. Simple sulphides of silver are best adapted to it, and, next to these, the combinations of complex sulphides, viz., pyrargyrite, polybasite, stephanite, proustite, etc.

Chlorides, bromides and iodides of silver are considered rebellious; argentiferous galena, blende, bournonite, as also argentiferous arsenical pyrites of iron and copper, are absolutely unsuited to this treatment.

Experience has proved that high-grade ores do not give as satisfactory results as those of medium grades, as, for instance, carrying from 1 to 2 kilos per metrical ton.

The patio process, as actually practiced in this district, comprises the following operations:

1. The ore is crushed in a dry state in a roller mill, reducing it to pea size, from which uniform samples, and, in consequence, correct assays, can be obtained.

2. It is then thrown in the arrastra and pulverized (with water) so fine that it will pass through an 80-mesh screen. This operation has a double object—to reduce the ore to very fine pulp, without which a thorough amalgamation is impossible, and at the same time to collect the gold on the amalgamated bottom of the arrastra.

3. The ore is treated in the patio.

4. The pulp is washed to collect the amalgam in the settler.

5. The amalgam is retorted to separate the silver from the quicksilver.

6. The silver is melted and assayed.

Not wishing to make this paper too long, I shall only enter into explanations relative to the third step of the process, namely, the treatment of the ore in the patio. The other parts would be of little interest to the Institute, since any of the methods commonly used in the United States are applicable to them.

Treatment on the Patio.—The patio is a large enclosure, paved with great care, and made as impenetrable to mercury as possible.

After the ore has been finely pulverized it is taken into the patio, where it forms what we call the torta, a mass of circular shape, 30 centimeters, more ore less, thick, and containing from 100 to 250 metrical tons of ore. The torta should contain sufficient water to dissolve the chemicals, but at the same time it must be of such consistency that it will not allow the mercury to settle on the bottom.

The chemicals used are chloride of sodium and sulphate of copper.

The amount of salt used is from 40 to 60 kilos, and that of sulphate of copper from 4 to 6 kilos, per metrical ton of ore. Mercury is used at the rate of 8 kilos for each kilo of silver in the torta.

The salt and sulphate of copper are first applied, after which the quicksilver is added, scattering it in the minutest possible atoms, with the object of distributing it over the whole surface of the torta.

The chemicals are thoroughly mixed with the torta by the treading of mules, an operation which is called repaso. Many attempts have been made to employ machinery in place of the mules, but none have met with success.

Theory of the Reaction.—The reaction at once commences. All the authors who have dealt with this matter have discussed at great length the question, What chemical reaction actually takes place in the torta? But up to the present time no exact and certain determination of this question has been reached.

The chief differences of opinion are whether the formation of chloride of silver takes place or not; whether it is the chloride or the bi-chloride of copper plays the principal part in the formation of the chloride of silver; and whether the bi-chloride of copper produced at the expense of the chloride of copper is the chief factor in the reduction of the ore.

The theory usually adopted here is the one advocated by the learned professor of chemistry in the State College of this city, Don Vicente Fernandez, who, in view of the practical results generally obtained, and the many experiments made with the greatest care by himself, admits the formation of chloride of copper and the chloruration of the silver, but in the form of sub-chloride. The sub-chloride is dissolved in the excess of chloride of sodium and then reduced to a metallic state by the mercury, and chloride of mercury is formed.

Prof. Fernandez recognizes the following reactions:

$$NaCl+CuO,\ SO_3=NaO,\ SO_3+CuCl.$$
$$CuCl+2AgS=S+CuS+Ag_2Cl.$$
$$Ag_2Cl+2Hg=Hg_2Cl+2Ag.$$

Or,

$$2NaCl+2CuO,\ SO_3=2NaO,\ SO_3+2CuCl.$$
$$2CuCl+2AgS=2S+Cu_2Cl+Ag_2Cl.$$
$$Ag_2Cl+2Hg=Hg_2Cl+2Ag.$$

Or, starting from the last equation but one,

$$Cu_2Cl+2AgS=2CuS+Ag_2Cl.$$
$$Ag_2Cl+2Hg=Hg_2Cl+2Ag.$$

This theory of sub-chloruration is in accordance with the practical results obtained. It calls for the loss of only one equivalent of mercury for one of silver, and practically the loss of mercury for 1 kilo of silver is 1.116 kilos, of which 1 kilo is the chemical and 0.116 kilo the mechanical loss.

The most important objection which has been made to this theory is that it cannot be that chloride of copper is in fact formed, since, were it present, it would attack the mercury in preference to the silver, and the loss of mercury would be much greater than it really is. Prof. Fernandez offers the following explanation in reply to this objection:

If chloride of copper, sulphide of silver and mercury are placed together, the last is attacked directly; but if a small amount of quartz powder (which principally forms the matrix of the ore of which the torta is composed) is mixed together with the three above-mentioned bodies, the mercury is then not attacked, and the amalgamation of the silver takes place. He infers that the matrix of the ore prevents the chloride of copper from attacking the mercury, and thereby allows the amalgamation.

Assays.—Three kinds of assays are used to find out how the treatment is working, namely, the tentadura, the assay of the amalgam and the assay of the residue.

A tentadura is made by taking small portions from as many different parts of the torta as possible, and washing them in a wooden bowl, varnished black inside. A rotary motion is given to the bowl, whereby the lighter particles are carried off, and the heavier ones deposited on the bottom in the order of their specific gravity. Three parts will then be distinguishable in the tentadura, which are called respectively el boton (the button), el cuerpo (the body), and la cabeza (the head).

The head contains in its extremity, or exterior part, the liz, which is the quicksilver in a state of powder, part of it being probably in the form of chloride of mercury. In the center it usually contains limadura—that is to say, amalgam of silver in a thick white brilliant powder, which has not yet been mixed either in the torta or in the tentadura with the rest of the amalgam, such mixture having been probably prevented by its peculiar molecular state.

The body is composed of iron pyrites, but it also contains limadura, principally in the parts nearest to the head.

The button is the globule of amalgam, varying in size in proportion to the amount of the pulp with which the tentadura has been made, and more or less liquid inversely, according to the amount of silver that has been amalgamated.

The amount, color and consistency of these parts indicate the state of the torta, what chemicals are still wanting, the amount of silver that has been amalgamated and, lastly, when the treatment is at an end.

The assay of the amalgam is made by weighing a little of it, taken from the torta, and, after having expelled the mercury, weighing the silver that remains.

The treatment is considered at an end when the amounts of silver and mercury contained in the amalgam are in the same ratio as the silver and mercury contained in the torta, allowing for the loss of mercury that has taken place in the treatment, which, as already stated, is 1.116 kilos for each kilo of silver treated.

This assay, however, is not always to be absolutely relied upon. If anything unusual has taken place in the treatment, it will not be exact. The assay of the residue is therefore made.

This is done by washing a little pulp and separating the amalgam. The residue or powder left behind is then assayed; and by comparing the grade of this with that of the torta, it can be exactly ascertained what amount of silver has been amalgamated. When the treatment is finished, the torta is washed, the amalgam retorted and the silver obtained smelted and assayed.

The tailings are concentrated in an apparatus called a planilla—a table upon which the operation is performed entirely by hand.

The whole treatment of the ore lasts from about three to six weeks, the time being longer in winter than in summer.

Costs.—The following is the exact cost of treating the ore in the Hacienda de Luna during a period of six months, in which 2531 metric tons of ore, carrying an average of 1.123 kilos of silver per ton, were reduced.

COST OF PATIO TREATMENT PER METRIC TON.

General expenses of management		$ 0 58
Coarse crushing	$0 69	
Fine grinding in arrastras	1 28	
		1 97
Manipulation in "patio"		0 44
Washing in settlers and retorting	$0 39	
Assays	0 28	
Planillas	0 20	
Direct taxes	0 38	
Sundries	0 85	
		2 10
Fodder for mules		3 93
Quicksilver	$2 34	
Sulphate of copper	0 77	
Salt	1 32	
		4 43
Total cost per ton		$13 45

The average loss of silver in treatment was 6.25% and of quicksilver 1.116 kilos for each kilo of silver extracted.

The consumption of chemicals was 4 kilos of sulphate of copper and 55.5 kilos of salt for each ton of ore.

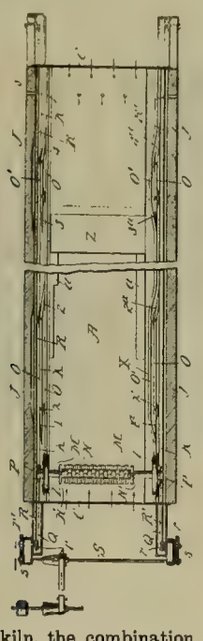
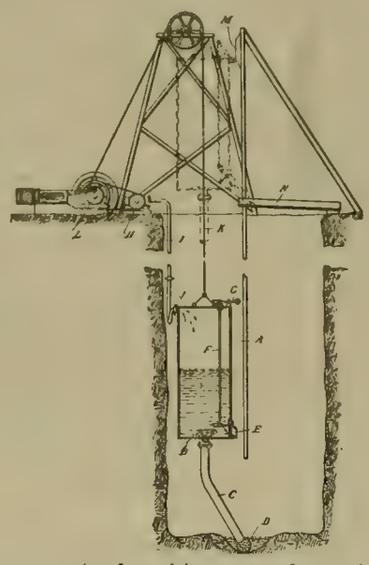
Latest Mining and Metallurgical Patents.

Patents Issued July 4, 1899.



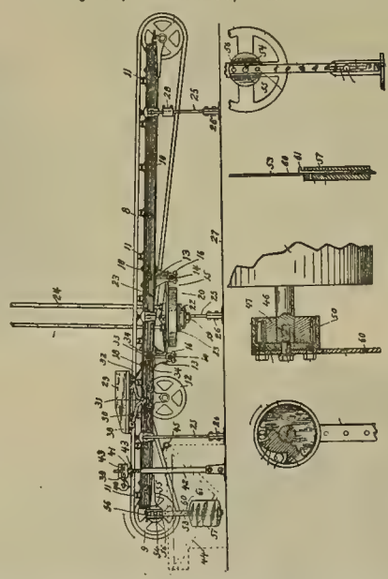
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

EXHAUST APPARATUS FOR ROLLER MILLS.—No. 627,514; A. G. Mather, Milwaukee, Wis.



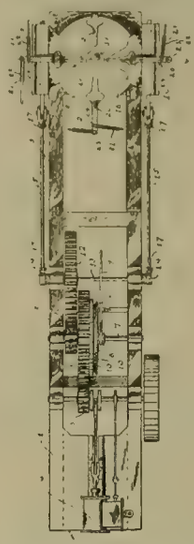
An apparatus for removing dust and moisture from mills, etc. A combination of a series of mills, the circular horizontal trunk, the suction pipe extending from the respective mills and joined tangentially to the trunk at different points in its length, and a suction apparatus connected with one end of the latter, whereby the dust-laden currents of air entering the trunk are caused to act successively to produce and maintain a spiral movement of the air longitudinally through the trunk, whereby precipitation of the solid matters therein is prevented.

ROASTING KILN.—No. 627,609; J. Zellweger, St. Louis, Mo.



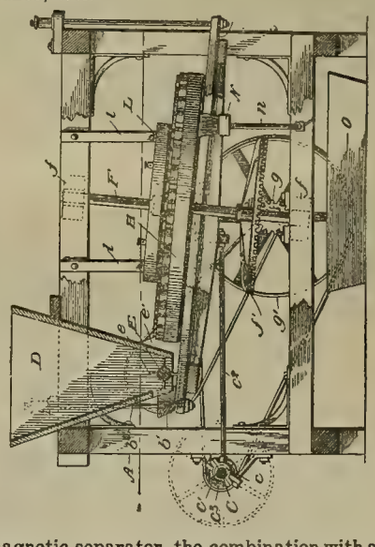
In a roasting kiln, the combination with a hearth, of tracks arranged on each side, a stirrer comprising supporting wheels which run on tracks, a shaft, and suitable stirrer blades, endless tow chains, suitable sprockets or rollers for endless tow chains, which sprockets or rollers are located beyond ends of hearth, traction lines connecting the tow chains with ends of shaft of the stirrer, and means for causing the travel of tow chains whereby, when traction lines are connected to chains above the sprockets or rollers, the stirrer travels in one direction, and when the connection of traction lines to the tow chains passes under sprockets the stirrer travels in an opposite direction; the combination with the side walls *J* and the roof *B*, of a hearth *A*, a stirrer above the hearth, curtain walls depending from the roof beyond the ends of the hearth for forming cooling chambers at each end of the kiln, and means for causing the travel of stirrer over the hearth in both directions under the curtain walls, and into the cooling chamber at each end of the kiln where the stirrer rests before commencing its return movement; a charging opening for depositing the material upon the rear end of the hearth, a raised side track adjacent to the main tracks at a point opposite the charge opening, switch tongues for causing the transfer of the wheels onto the lower main tracks in one direction to force the material toward the discharge end of the kiln, switch tongues for causing the transfer of the stirrer onto the raised side track when stirrer is traveling in an opposite direction, whereby stirrer is elevated above the accumulated material under the charge opening, and means for causing the travel of stirrer.

MEANS FOR RAISING WATER FROM MINE SHAFTS, ETC.—No. 628,219; R. E. Browne, San Francisco, Cal.



In an apparatus for raising water from mines or shafts, the combination of a frame at the head of a shaft, a tank supported upon the frame adapted to be raised and lowered in the shaft, tank having a suction pipe, and a valve-controlled discharge opening at its lower end, a vacuum generator at the shaft head, an adjustable pipe connecting the generator with the tank, hoisting mechanism for raising and lowering the tank, and means for automatically opening the discharge opening of the tank when the same reaches the discharge point in its upward movement.

ORE CONCENTRATOR.—No. 628,105; A. G. Mather and F. T. Snyder, Milwaukee, Wis.



The combination of a frame, flexible supports connected at their upper ends to the frame and at their lower ends to the flooring, and capable of yielding in all directions parallel to the frame, a concentrator vessel or surface mounted in the frame, mechanism for shaking the frame and concentrator vessel, shaking mechanism consisting of a gyrator mounted so as to move about an axis not passing through its center of gravity, a driving-belt pulley mounted on the axis of the gyrator, guide pulleys mounted on one side of the same frame which carries the gyrator, whereby the distance between the centers of the pulleys does not change, and an endless belt passing around the driving pulley, thence engaging the guide pulleys and extending to any suitable source of power. A frame, having opposite side pieces, rods connecting side pieces, a spider adjustably mounted on the rods, a pin fixed in spider, a shaking mechanism consisting of a gyrator mounted on the pin, so that the axis of the pin does not pass through the center of gravity of the gyrator, and an ore-concentrating vessel or surface mounted on the frame. Drums mounted in the opposite ends of the frame, an endless belt passing around the drums, means for imparting a gyratory movement to the frame, a strap adapted to follow the longitudinal movement of the frame and to bend laterally with the sidewise movement of frame, an adjustable retarding and resisting device at the lower end of the strap and clutch mechanism between the upper end of the strap and the journal of the drum, whereby on the thrust of the frame in one direction the clutch mechanism is set so as to clutch the upper end of the strap to the journal of the drum and thereby cause a rotation of drum in one direction, and on the reverse thrust of the frame to cause a disengagement of the clutch mechanism, whereby a reverse rotation of the drum is prevented.

POWER MECHANISM FOR PUMPING OIL WELLS — No. 627,604; C. E. Sutton, Toledo, Ohio.

Means for pumping oil wells comprising a base having an annular upwardly projecting bearing near one end and in its transverse center anti-friction rollers journaled in bearings secured to base, a pitman wheel journaled upon upwardly projecting bearing and resting upon the anti-friction rollers at a point near its periphery, housings carried by base upon each side thereof, rack bars arranged in the housings, means for reciprocating rack bars, toothed segments carried by pitman wheel with which the rack bars mesh, arms secured to and projecting radially from pitman wheel, and pitmen connecting outer end of arms and the pumping mechanism of oil wells.

MAGNETIC SEPARATOR.—No. 628,078; A. Dings, Milwaukee, Wis.

A magnetic separator, the combination with a conveyor of a revoluble horizontally disposed disk lying parallel with conveyor, and a having a portion overhanging the conveyor and a portion extending laterally thereof, a series of magnets carried by disk, circuit controllers for magnets carried by disk and provided each with a stationary and a movable part adapted to make contact with each other, and a stationary device for engaging movable parts of the circuit controllers, for separating the movable and stationary contacts and cutting magnets out of circuit while they are out of line with the conveyor.

What It Represents.

The MINING AND SCIENTIFIC PRESS represents the honest element in the mining world.—Phœnix, Arizona, Republican.

Cyaniding in Australia.

One of the chief difficulties met with in cyaniding dry ore is caused by the fine dust in the ore collecting in layers of slime when the cyanide liquor enters the vat. These slimes are often rich in gold, but they effectually prevent free percolation. A method introduced by Mr. Grayson at the Associated mine in Western Australia is to prevent movement by wetting the ore very gradually, by upward soakage or capillary attraction. The solution enters the vat from a very small pipe, and it requires sixteen hours to saturate the ore. The sorting of the slimes by settling currents seems to be practically avoided by this method. Another method much favored is to altogether remove the slimes from the ore and treat each product separately; the sands in the vat and the slimes by filter presses.

It was natural to expect that the dust in roasted ore would present the same slime troubles as that from the oxidized class. The damping of the ore before charging into the vats was found effectual in preventing slime movement, but the lime ingredients in the ore caused a packing of the vat contents to a degree which caused serious embarrassment and loss.

Lime in the ore is, during the roasting process, in part converted into quicklime, and in part to an overdone plaster of paris. In 100 tons of ore there is, on the average, 4½ tons of the plaster material, and about 8 tons of quicklime. In other words, about 12 tons of cementing mortar in each 100-ton vat exists in a finely divided condition, and well mixed with the ore. After standing in water for a fortnight it was not only a matter of observation that the vatted ore became set and required to be dug out, but that often the percolation was altogether obstructed. Particles of gold also became shielded from the cyanide attack. One method proposed to get over this difficulty was to keep the ore permanently agitated either by means of compressed air or some other kind of stirrer. It would seem, however, that in damping the ore before trucking it to the vat the quicklime and the plaster in it is quenched, and in a great measure deprived of their injurious cementing powers. Possibly if the quenching water was highly charged with air before using, some carbonic acid might be conveyed to the quicklime particles and convert a portion back into carbonate of lime (which is their state in permanent cement) before the vats are charged with cyanide solution. Another proposal was to increase the strength of the cyanide solution in order that the time of contact might be shortened. This, however, is impracticable unless the gold is extremely fine, because the cyanide action is a very slow one. The rate of percolation during fifteen days at Main Reef is, according to the records, equal to 2½ inches per hour.

The amount of percentage of the gold extracted from the ore varies with the time allowed for the cyanide to remain in contact with it. Gold leaf 1–240,000th of an inch in thickness will dissolve in twenty minutes, but a speck as large as a pin's head will require three weeks. A speck four times more bulky will require sixteen times longer. We see at once that unless a company is prepared to have a few acres of vats standing full of ore until their gold contents are exhausted, they will have to be content with the highest percentage extraction possible within a reasonable time. The extraction obtained at the Main Reef approaches 90% with ten to twelve days' treatment.

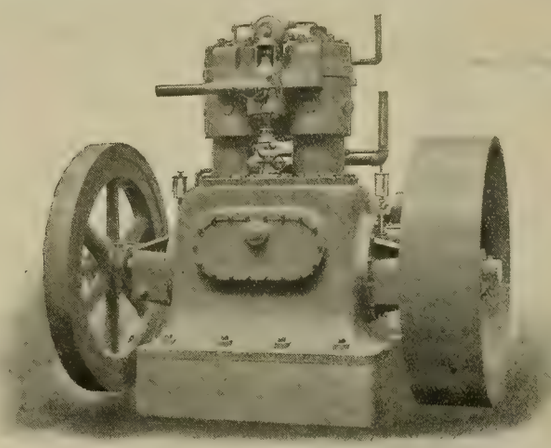
It is well known that the gold solution obtained from the vats is run through trays filled with zinc shavings, and that in dissolving the zinc the liquid parts with the gold. This reaction must take place at a certain rate, for if it is too slow the gold falls out in such infinitely small quantity that the shavings become plated with shining metal, perhaps intermixed with some lime deposits, but if the rate is sufficiently accelerated it falls down as a black sludge. When the plating takes place it is conceivable that the zinc may be so completely concealed that contact between it and the solution is cut off, and no more gold is thrown down. This often happens with very dilute solutions, in which the gold occurs in very small quantity owing to the poorness of the ore. By using stronger solutions of cyanide, however, the action of the zinc is more active, and plating prevented owing to the rapid eating away of that metal.

In reference to the ball mill as a machine for powdering the ore to a size necessary, if they do all that is claimed for them they have come to stay. If revolved slowly the balls and the ore grind together, the action being a rubbing one. If driven faster the balls and ore will tend to travel round the circuit, and if the speed is correctly regulated to just short of this velocity the whole lot will, before reaching the top, fall clear of the axle, free, with smashing violence to the bottom of the drum.

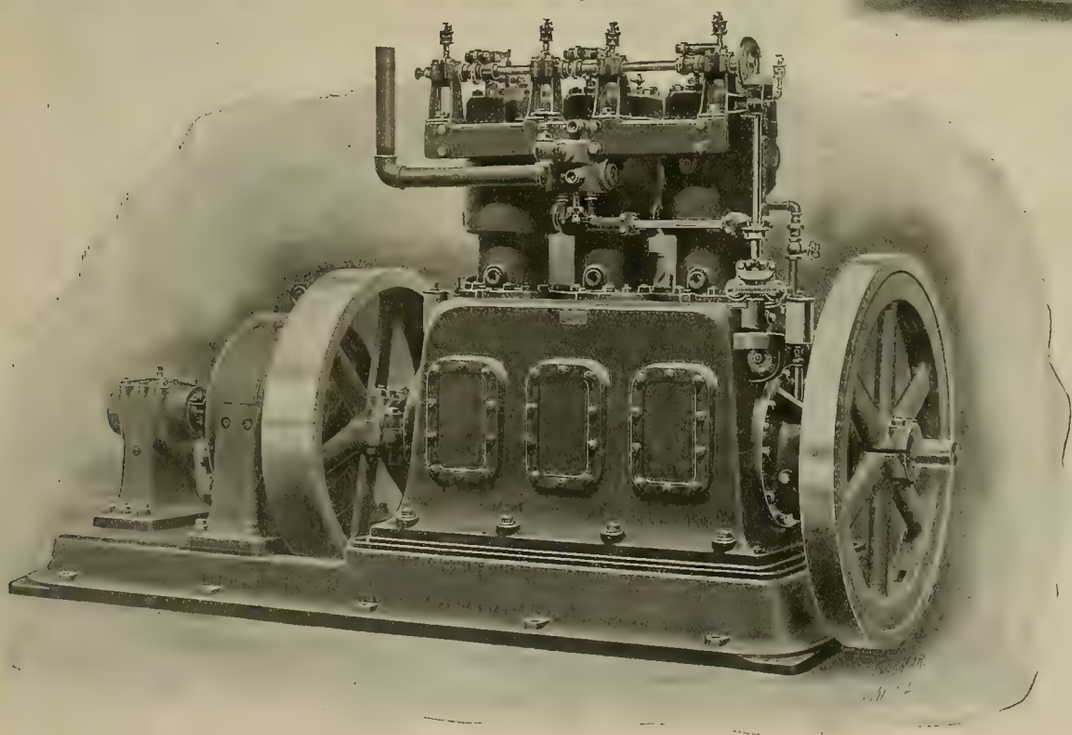
The action is really that of dry stamping, but the stamp is a simple one, without shank to break or guide to be lubricated. With a 5-foot mill this action is obtained when turning at not less than twenty-three revolutions per minute. In the smashing down of the stone by the balls, and previously by the stone crackers, the stone is broken to a powder so dry that it is difficult to retain it in the works. The large quantities of dust that are seen to emanate at times from some mills would seem to suggest that the practice of drying the ore before crushing may be carried to too great a refinement. The Main Reef plant includes a revolving dryer, but it is unlikely that it will be replaced when it is worn out. It will be a substantial saving in steam power and fuel if it is found practicable to dispense with the dryer.

What grade of rich ore will be found most profitable to cyanide and which grade to smelt is not yet decided. The eating up of the zinc by the cyanide gold solution causes a large quantity of hydrogen gas to escape in bubbles through the liquid. These gas bubbles explode with great violence when touched by a lighted match, and the surface of the whole box becomes covered with a sheet of fire for a moment. Should, therefore, the escape of the gas be hindered by deficient ventilation, or through treating extremely rich ore be produced in such quantity that seven-eighths of the atmosphere in the filter house be formed of it, the introduction of a lighted lamp or ignited match would produce a terrific explosion.

In brief summary it may be said that the experience of working to date shows that the present furnace, which was first fired in February, took six weeks to get heated throughout. Its estimated capacity of 1000 tons monthly on ore containing 8% of pyrites is exceeded by one-half. The richest grade of ore which it will be advisable to cyanide will not exceed 1½ ounces. The extraction will equal 90% of the gold contents. The cost of mining, milling, roasting and cyaniding a 1230-ton parcel just finished is under 38s per ton. At this figure sulphide lodes from half an ounce grade upwards can be profitably treated.—Kalgoorlie Miner.



The Commercial Development of the Gas Engine.



More than two centuries ago attempts were made to build internal combustion engines. A hundred years later further advances were made, but it has remained for the closing years of the nineteenth century to see a thoroughly reliable and efficient gas motor designed. The name of Westinghouse has been connected with many improved mechanical devices, but probably none of them has required so much patient thought and exercise of ingenuity in overcoming difficulties as the Westinghouse gas engine recently placed upon the market.

The name Westinghouse is a guarantee, for it is never used in connection with any mechanical device until the machine has been thoroughly tested by years of actual practice. This is exemplified in regard to gas engines of larger sizes. For nearly two years a Westinghouse gas engine of 250 H. P. has been steadily working at East Pittsburg direct connected to an electric generator, and another of 650 H. P. has been continuously at work for nearly a year direct connected to a 400 kilowatt generator. These machines have been tested in every way and are now confidently offered to the users of power.

The result of these practical tests is so entirely satisfactory that Westinghouse gas engines can be sold upon their proven merits as fitted for all power purposes. Two 2-cylinder, 8x10, 25 H. P. Westinghouse gas engines have been sold to the Niagara Lithographic Co., Buffalo, N. Y., for belt connection, to be run at a speed of 300 revolutions per minute. For the lithographic process, it is of the greatest importance to maintain a constant speed in the generating engine. After thorough investigation it was decided that the Westinghouse gas engine could insure good work, as it was imperative not only to have the speed per minute constant but also the variation of angular speed during each stroke a minimum.

The Bradford Electric Light Co., Bradford, Pa., purchased four Westinghouse gas engines for belt connection to electric generators. Three of the engines are 13x14, 3-cylinder, 125 H. P., with a speed of 260 revolutions per minute. The fourth engine is 200 H. P., with a speed of 225 revolutions per minute. These engines will be operated with natural gas, the regulation guaranteed within 2% on a consumption of 13 cubic feet of natural gas per hour. The boilers of the existing steam plant were heated with natural gas, consuming 52 cubic feet per hour; the new Westinghouse plant will not exceed 13 cubic feet per hour. The first test run showed a consumption of only 9000 cubic feet of gas in 8¾ hours when driving 102 full arc lights. This installation will also include a small engine for driving an air compressor, for charging air reservoirs for starting engines, also a power pump to supply jackets with water. The speed of the small engine is varied by a special device, according to the load on the main engines, so that water may be supplied to jackets as demanded and so reduce waste of water and wear on small engine and pump.

The Suffolk Gas & Electric Light Co., Bay Shore, L. I., has two Westinghouse gas engines running on illuminating gas—one of 50 H. P., 3-cylinder, and the other 85 H. P. Both are belted to single phase, 2200-volt alternators.

The largest plant contracted for is that of the Columbus Electric Light Co., Columbus, Ohio. When completed next fall it will be the most extensive station relying exclusively on gas engines for its source of power. It will be equipped with two Westinghouse gas engines, each with three cylinders, belt connected to Westinghouse generators, to supply commercial lighting. Natural gas will be used. One engine will carry a normal load of 650 brake H. P. Its speed will be 150 revolutions per minute, driving a 375-kilowatt alternator at 400 revolutions per minute. The alternator will be two phase, 2200 volts and 7200 alternations. The other engine will develop 280 H. P. with a speed of 200 revolutions per minute, driving a 180-kilowatt alternator at 514 revolutions per minute. There will also be installed one 11¼-kilowatt and one 7½-kilowatt exciter.

The smaller of the two accompanying cuts represents a two-cylinder Westinghouse gas engine fitted with a pulley for belting to a dynamo; the larger one illustrates a three-cylinder Westinghonse gas engine direct connected to the dynamo, and is of the type referred to—the 280 H. P. gas engine.

Mining Summary.

ALASKA.

The Standard Oil Co., having acquired the Russian title, and a later mineral land grant from the United States Government, to the coal lands at Cook inlet, Alaska, is preparing to develop them. Alfred Ray, manager for the company at Portland, has outfitted a corps of engineers, which has sailed for the north. They will complete surveys partially made and make other surveys for wharves, railroads from the mines to the shore, etc. The Cook inlet coal mines were worked by the Russians years ago, and later by a San Francisco, Cal., company.

Victoria *Times*: Miners who, under E. S. Ingraham of Seattle, were sent north by Prince Luigi, nephew of the King of Italy, report having found gold near Port Clarence. A letter from C. E. Chard says the find has been made on an unmapped creek near Port Clarence, one of the United States Government reindeer stations. Fourteen claims have been staked. In five hours Chard and two others took out $20 from the discovery claim with a rocker.

Juneau *Record*: Mr. Sloan, of Wrangel reports that on Helm bay prospectors Dyer and Smith, after tunelling 40 feet from the place where last year they took out a pocket of $12,000, found the main vein; 40,000 feet of lumber has been shipped there and Mr. Dyer is pushing development work.——Near Sumdum Mr. Sharp has uncovered a 15-foot vein of ore.

ARIZONA.

(Special Correspondence). — The Azurite copper mine, eighteen miles south of Tucson, is steadily producing metallic copper and matte.

The Barnes No. 1 is looking well. In the east drift, 150 feet from the surface, the vein is 10 feet wide and consists of carbonate and black oxide of copper. Some native copper is also found. A number of claims in the district are showing improvement with development.

Tucson, July 5th, '99.

Prescott *Journal-Miner*: Work is to be started again on the Zonia Copper Co.'s property near Kirkland. ——J. H. Hise has brought another bar of bullion up from the Monte Cristo mine.——W. T. Little has shut down the Red Rock mine on account of bad air. A body of ore above average value was recently struck. He is now drifting to connect with a tunnel to obtain air.—— Mr. Gibson, engineer of the Arizona Eastern & Montana Co., which recently took a lease on the Commercial Co.'s smelter on Big Bug, says he will put the plant in repair, and within the next week or two will be ready to buy and pay cash for ore.

Prescott *Courier*: C. Born of Prescott owns a group of claims adjoining the Groom property, twenty miles east of Wickenburg, and has bonded the same to the Phœnix Development Co.

Kingman *Miner*: Dr. Hamilton of Los Angeles has bonded the Keystone mine, at Mineral Park, from J. Uncapher, and will soon have men at work.

CALIFORNIA.

Amador.

Prominent New York capitalists, including the president of the New York Central Railroad, have been looking over the mining field of Amador, and, it is reported, are satisfied that there is enough business to justify the extension of the Galt-Ione branch from Carbondale to Jackson and Sutter Creek.

The new vertical shaft of the Kennedy M. Co. near Jackson is calculated to reach the vein at a depth of 3500 feet vertically below the collar of the south shaft, or more than 1000 feet lower than the present lowest level in the mine. A crosscut has been started eastward at the 1900 level to intersect the line of the shaft. When a point beneath the shaft has been reached a raise will be commenced to hasten connection at that level. The sinking of this deep shaft through the hanging wall country of the lode will give some valuable information concerning the possibilities of that portion of the country penetrated by the shaft, and which up to this time has never been explored excepting in a most superficial manner.

Jackson *Dispatch*: J. Graham of Forest Home reports mining operations will be inaugurated in his district shortly.——At the Centennial mine, near Drytown, Supt. Gross reports that they are working. New machinery has been added to the plant. The shaft is being repaired and straightened preparatory to sinking. The Centennial rock prospects well, showing galena and arsenical sulphurets, also containing gold.

Calaveras.

The Fort Wayne Gold Producing Co. of Indiana. whose works in San Andreas were attached by striking workmen on July 1st, has made an offer through Attorney Solinsky, which has been accepted by the miners. The back pay will be paid within July, the miners to release the attachment and pay costs.

An important strike has been made in the Gwin mine in the main shaft at a depth of 1580 feet. The shaft is vertical and is started in the hanging wall, reaching and crossing the main vein between the 1200 and 1300 levels. The vein and formation dip easterly at angles varying between 70° and 80°. The shaft, having been continued to a point 1580 feet from the surface, unexpectedly encountered a vein, the width of which has not yet been determined. On the hanging wall side it has a dip of 77°, and from a calculation based on the known angle of dip of the main fissure this new vein is 178 feet west of the main vein. On the 700 level a crosscut was run several hundred feet west from the shaft and a small vein encountered, which it is thought may be the one found 900 feet lower. Three drill holes have been made in the new vein and the drillings assayed, giving $9.21, $21.29 and $17.57, respectively. A single piece of ore selected at random assayed $127.13. There is also known to be a vein some distance east of the main fissure, but it, like the new find, is undeveloped. The discovery of rich ore at the depth of 1600 feet in a vein the existence of which was scarcely suspected is considered of unusual importance to the mines of this section as indicating the possibilities of deep mining on the gold belt. The past few months some experiments have been made in milling the ores of the Gwin mine, one battery of five stamps being fitted up for experimental purposes. As a result the capacity per stamp has been increased from 3¼ tons in twenty-four hours to 4.6, and it is thought it can be increased to 5 tons, without material loss in the tailings. The increase in capacity was secured by lining the mortars, which are broad, with iron plates, which may be replaced when worn. As the insersion of these plates converts the mortar to a narrow trough, the discharge is materially increased without changing the height of discharge or increasing the speed of the stamps. This change could not be made to advantage everywhere, as a less free milling ore similarly treated would probably lose. This increase in capacity resulted in overloading the 4-foot concentrators and specially designed 6-foot belt machines have been substituted for the 4-foot machines formerly in use. Two machines are set to each battery, and no sizing boxes are employed. The tailings are worth from 25 to 30 cents on an ore which mills $5 to $10 per ton. A canvas plant was operated for a year on Gwin tailings and produced a small percentage of concentrates worth $30 per ton. The enterprise did not pay and was abandoned.

Mokelumne Hill *Chronicle*: Work at the O'Neill mine on Prussian hill is progressing. Five stamps are running steadily on ore taken out while drifting. Seven men are employed. ——Sinking is to be commenced in the Thorpe mine at Fourth Crossing. This has necessitated a lay-off for about two-thirds of the men employed.

Del Norte.

Crescent City *Record*: Reports from the smelting works to the workers of the Union, from a shipment of ore that was made, return 18% copper, which will pay a margin after deducting expenses of mining, smelting, freight, etc. The work of mining in the Union will be continued.

El Dorado.

The El Dorado County Miners' Association meets at Placerville July 15.

Fifty men have been laid off at the Boulder mine on Webber creek, caused by inability to obtain water to operate the 30-stamp mill at the mine. The water supply on the Gold Hill branch of the El Dorado canal will be needed for the next three months by the farmers and horticulturists in that vicinity. The mine is the property of Welman Bros.

A 10-stamp mill is being erected at the Cambrian mine, Gold Hill district. This property was purchased one year ago by Colorado capitalists, who have developed it.

Placerville *Nugget*: Work is progressing on the new 10-stamp mill at the Cambrian mine, near Lotus. Development work is also in progress.——G. W. Harvey & Co., who recently purchased the P. Philip's gravel mine, near Volcanoville, are driving a tunnel to tap the channel.——Shultz & Root are sinking a shaft on the Gentle Zephyr mine, near Volcanoville. They have a 3-foot ledge. The ore carries galena that assays in gold.——The Old Jones Hill gravel mine, near Georgetown, has been leased by Barklage & Co. for five years. The mine was formerly a large producer, but has been idle for years.——The Van mine, near Georgetown, was recently visited by W. English of Oakland, who with Ex.-U. S. Marshal Baldwin and T. J. Clunie of San Francisco, are the principal owners of the property, contemplate resuming work on the property.——Work has been suspended for the summer at the Oro Fino mine, at Big canyon, below El Dorado, there being no water available for power for the next three months. Forty men will be laid off. The mine is owned by Hayward & Lane and has for a long time been a steady producer.

Humboldt.

Yreka *News*: A San Francisco company, of which Mr. Young is Supt., has bought the mines near Orleans. Several years ago a company patented this land and had it in readiness to begin work when the heavy snowfall of 1890 destroyed the flumes for a distance of twelve miles. The new company built a sawmill and are sawing lumber with which to rebuild the flumes. They have been in course of construction for some time, and giants will soon be piping. There are several hundreds of acres in this placer claim.

Kern.

The Butte mine, at Randsburg, is credited with producing $3300 during June. The mine is to be systematically developed.

Most of the custom mills of the district are kept busy.

Madera.

H. Lindsay of Fresno has sold the Standard mine at Fine Gold to an Eastern firm, and states that he expects to sell two more mines within thirty days.

Mariposa.

The Merced G. M. Co., at their recent meeting, held in Butte, Mont., voted to increase the capital stock of the company from 100,000 to 150,000 shares at a par value of $15 per share.

Nevada.

The San Francisco & Grass Valley M. & D. Co. has been organized for the purpose of working mines in Grass Valley. The first property to be developed will be the Electric or Green Mountain mine, and J. C. Roberts has been appointed Supt. The mine will be unwatered and development commenced. The following is the board of directors: G. W. Root, A. W. Johnson and W. I. Michell of San Francisco; I. Haas and J. C. Roberts of Grass Valley.

The New York Consolidated quartz mine, now being worked by tributers, is to be operated on a more extensive scale. It is owned by Dr. S. M. Harris, J. Burke and the Weissbeins of Grass Valley.

The Champion M. Co. of Nevada City district has recovered the ledge in the Spanish mine.

Grass Valley *Union*: J. G. Cohoe is making good progress at the Gray Eagle mine. Compressors are being operated in the tunnel and ten men are employed.

Placer.

A compressed air plant is being installed at the Red Point mine, near Damascus, on the Forest Hill divide.

Auburn *Republican-Argus*: Development work is being done at the Gold Blossom. They are working toward another pay chute.——A compressor and two compressed air drills have arrived at the Alder Creek mine, Blue Canyon. There are twenty-eight men at work there. Wages are from $3.10 to $3.50 a day. They are taking out ore that yields $25 to $50 a ton.

Colfax *Sentinel*: Air compressors are to be put in at the Alder Creek mine near Blue Canyon, and a mill is to be built. Twenty-eight men are employed. L. Balliet is Supt.

Auburn *Herald*: F. Brye has ore from the Bellevue at the 100-foot level which is very rich.——The old Mayflower claim has been leased to J. De Bon and others. Supt. Geo. McAulay reports that if the Mayflower Co. can buy the Dutch Washington they will get an outlet to a portion of the Mayflower ground that has never been worked.——E. Kavanaugh has picked up a $30 nugget in his claim, the Channel Bend on the Middle Fork.——It is reported that the lessees of the Breece & Wheeler mine are getting pay dirt.

Riverside.

(Special Correspondence).—The Iron Chief mine, thirty-five miles northeast of Walters station, is being worked steadily, water being pumped over a divide from Cottonwood springs, a distance of eighteen miles. The ore is treated by the cyanide process.

San Bernardino, July 8th, '99.

San Diego.

It is reported that a strike has been made in the High Peak mine at Julian. The ores of the district are generally high grade.

Shasta.

(Special Correspondence).—H. P. Posey of New York, owner of the mines at Bingham, Utah, and H. Holmes of Salt Lake City, Utah, have secured a bond on the Mammoth group of mines near Kennett, through J. F. Coleman, from the owners, Saeltzer & Kahney, and have commenced extensive development work.

Kennett, July 10th, '99.

The Black Diamond group of copper mines on Stillwater creek, twelve miles from Redding, has been sold by J. H. Kahny, E. Holden and T. Klaukins for $80,000. The purchaser is the North California Investment Co., the new company recently incorporated. The company will develop the property.

W. R. Russell of the Bon Ton mine in Muletown district it is reported will put in a roasting furnace at his mine. It will have a daily capacity of thirty tons.

Mrs. R. L. Gipson of Keswick has found what may prove to be a mine four miles west of Keswick. The vein is gold-bearing rock the thickness of one's hand. She broke off a piece as large as a walnut which contained $17.45.

It is reported that Captain De Lamar is negotiating for the Bully Hill copper mines, owned by James Sallee, the $250,000 bond held by L. A. Scowden, of New York, having expired July 1st. It is said Sallee has raised the price of the property to $350,000. A German syndicate is said to be negotiating for the property.

The self-shooter at the Pat Holland mine, on the east fork of Coffee creek, is completed and operating. It is located on the upper part of the stream at a place adapted for the purpose, and there an artificial reservoir was constructed by damming the creek. Then a self-opening floodgate 12x14 feet was built on the lower outlet. By this means a great body of water accumulates and discharges itself at regular intervals. Miners with powder and sledges break up the large boulders of the stream, and several hundred feet of bedrock is uncovered in this manner annually.

Shasta *Courier*: Pugh & Menzel's mill, on Clear creek, has started up, and is expected to run steadily this summer. A great deal of development has been done.——Lydiard & Dickey of the Santa Clara M. Co., on Clear creek, have put in a pump to drain a shaft they are sinking near the water's edge. They have taken out and sacked ore for shipment. ——Work on the West Point placer claim on Clear creek has been stopped for the season by C. L. Paige, manager for the Sunset G. M. Co., owing to scant water supply.

Siskiyou.

The Schroeder mine, discovered thirteen years ago, has been sold to a Canadian investor for $100,000.

T. McCauley has made a discovery on the west fork of Deadwood. Open cuts at intervals of 400 feet show a vein 4 feet wide in places.

Yreka *Journal*: The Cherry Hill mine at Cherry Creek is to have a new manager.——J. W. Martin, acting agent in starting development work at the Mabel quartz mine, between Oak bar and Scott bar, has arranged for a road to the mine, located a mill site and making preparations for putting up a mill.—— The Cape quartz mill on Greenhorn, under the supervision of Mr. Adams, was closed down before the 4th, after a run which gave satisfaction. It will be started up after having another stamp and a concentrator added. The quartz is improving.——The Spengler brothers are working with a good force at their placer mine near mouth of Humbug creek, sluicing bedrock gravel uncovered during the winter and spring by ground sluicing. The water supply is getting light.

Scott Valley *Advance*: The Gold Ball mine closed Saturday for three weeks. The mill will continue running.——Phillips Bros.' mine near Seiad has been bonded to G. Dailey of Yreka.——L. Erickson has twelve tons of ore at the Jumbo mill from his claim in White's gulch.——Green & Jones are putting in a discharge arrastra at their claim on Cedar gulch, three miles from Callahans.——A new ditch is being dug at the Bouviere mine on Slide creek to work the ground on the east side of the creek.——Johnson Bros., on Horse creek near Seiad, have built an arrastra and are crushing quartz which assayed $40 a ton.—— The Salmon River Co. have cleaned up after a two week's run, which is reported to have produced $4000.——The Summerville M. Co. are replacing the 150-foot span of flume which recently broke down.——T. Luddy and H. Finley will have a mill test of five tons of ore from their White's gulch claim, at the Jumbo mill.——A cinnabar ledge has been discovered by F. Fradenburg of Klamathon on Jenny creek, a branch of the Klamath river near the Oregon line.——The company represented by F. D. Fraser, developing the Nehrbass and Rostell properties on Greenhorn, near Yreka, has erected a hoisting plant.——Peters Bros. are extracting some high-grade ore from their claim in White's gulch. They are extending the lower tunnel. The vein is 3 inches wide. ——F. Myer and O. Peterson discovered a quartz prospect three weeks since on Tanner Peak near Sawyers, which shows a width of 30 inches at the surface and assayed $30 a ton. ——A ledge which mills $20 a ton has been discovered on the west fork of Deadwood creek by T. McCauley. Open crosscuts have been made, showing a width of 3 feet.——The clean-up for the month's run of two arrastras at the Lanky Bob mine in White's gulch gave $2000 in gold from thirty-eight tons of rock. In the mine the upper and lower tunnels are being extended on the ledge. The upper tunnel is in 300 feet, and the lower, from which the best ore is being taken, is in 200 feet.—— A crushing of nine and three-fourths tons of ore from Johnson & Finley's claim in White's gulch, recently completed at the Jumbo mill, returned $800 in gold. Work was commenced six months ago by Johnson & Russell.

Yreka *News*: The Salmon River M. Co. is cleaning bedrock. Several specimens have been lately picked up—one weighing $28.25. ——The Commodore mine has made the last payment to Humphreys & Quigley. During the seven months' run 60% of the output has paid the purchase price of $26,000.——The Aromas mine, of which Mr. Chalmers is Supt., has a new elevator working satisfactorily. The company has had to rebuild many miles of ditch.——The Golden West mine, near the Black Bear, owned by Hickey Bros. of Sawyers Bar, is paying. The ledge has an average width of 2 feet, between porphyry and serpentine. Thirty tons of the ore crushed avaraged $535.——A. Erno of Quartz Valley has sold his placer ground to Page & Co. An 85 H. P. boiler has arrived for the new company.

Trinity.

A great deal of development work is being done this season in the New River district.

Platinum and iridium are reported being saved in considerable amounts with the gold in placer mines along the Trinity river. The company is the Adele M. Co., and the property the old Chamberlain gravel mine, near Paulson's ranch, where two giants have been operating during the season. Prof. G. E. Bailey is Mgr. of the property.

The Altoona mine has recently shipped 140 flasks of quicksilver.

Tulare.

Porterville *Enterprise*: The Minnie Ellen was closed down last week temporarily by J. MacDonald, pending arrangements with F. Cook and partners for an extension of time. The time is up on the 22nd of this month, at which date the whole of the purchase money is due, or in default of payment the mines revert to the owners. F. Cook offered an extension of time if MacDonald would augment the price. This, it is understood, MacDonald has refused to do.

Tuolumne.

Between Groveland and Crocker's, on the Yosemite road and on the county line dividing Tuolumne and Mariposa counties, the Golden Crown M. Co. of San Jose, Cal., is developing a group of claims, the principal location being the Big Betsy. The main shaft is down 400 feet, and was sunk on the vein the upper 300 feet at an angle of 51°. At this point the vein assumed a steeper angle, but the shaft was continued at the same pitch as above. At 380 feet a small vein was encountered which at the 400 level is reported to be 10 feet wide, consisting of banded quartz (ribbon rock), carrying good values in gold. The foot wall vein contains considerable sulphide mineral. The mill plant consists of rolls for pulverizing the sulphide-bearing ore, which will be roasted in a furnace now completed, and further treated by the cyanide process. This is the first plant of the kind built in California. A 10-stamp mill has been built for treating the free-milling ore.

Yolo.

W. T. Parks, H. A. Mefford and J. C. Ball have filed with the County Recorder their claim to a mine location in Capay valley. It is reported that a lode has been discovered bearing quicksilver, gold and other valuable mineral deposits.

COLORADO.

J. B. Grant, former Governor of Colorado and chairman of the operating committee of the American Smelting & Refining Co., testified before the Industrial Commission at its session on the afternoon of the 12th inst.

B. C. Bell acted as chairman of the meeting and Mr. Ratchford conducted the examination of the witness. Grant's testimony was regarding metalliferous mining and smelting. He reported the mining industry in Colorado as in a satisfactory condition, and said that, owing to most ore containing a combination of two or more metals, the output would be very little more with silver at 90 cents an ounce than at 60 cents. Grant said he favored combinations of capital and regarded concentration as the necessary results of competition. The labor union, he said, sprang from the same cause as the trust. He gave his reasons for refusing to recognize the union in the present smelter strike, but said he did not oppose union labor as a principle.

The Ellers' smelter at Pueblo, one of the trust plants which resumed operations a few days ago, was again shut down on the 8th inst. Members of the Smeltermen's Union induced the workmen to come out. The company claimed to have 350 men working, and all but 50 refused to work. The company at once ordered the fires drawn.

BOULDER COUNTY.

Mgr. Walter of the B. & M. mine has placed more men on the payroll of the company—thirty in all. Two levels are being run—west 200 and 400—and other development work done.

Ward *Miner*: At the Morning Star mine at Ward three shifts are driving the crosscut toward the ground where the prospect drills recently revealed a body of ore.

Eldora *Miner*: While stoping on the 200-foot level of the Enterprise mine last week some $18,000 ore was encountered. Thirty men were recently put to work.——The Ward pyritic smelter has been improved in various ways since it was closed down last fall. It is capable of handling 100 tons per day and will be blown in July 17.

CLEAR CREEK COUNTY.

The 2½ level of the Old Pelican mine of Georgetown, after running a long distance in barren ground, has come into a large streak of rich ore. The drift is 5500 feet long—the longest in the State.

Silver Plume *Standard*: Lampshire & Co. have had a run from their lease on the Illinois lode of the Pelican property, which gave 320 ounces of silver per ton. J. O'Connell & Co. also had a run of five tons from their lease on the same level which returned 226 ounces of silver per ton.——Robeson & Wolfe are having work done on the Stevens mine preparatory to commencing development. They will drive three levels east and west to open up new ore bodies and also crosscut for other lodes.

Idaho Springs *Gazette*: The Texas group, consisting of two claims, is being developed into a mine, the new machinery is in place and a contract let to sink another 100 feet. The paystreak is 10 inches wide.——A 5-foot vein has been opened in the St. Louis lode. The Surprise is producing ten to fifteen tons of smelting ore per day.——Dr. Ashbaugh of Central City has his 10-stamp mill crushing ore from the Lombard mine.——A whim has been erected by M. Ireland on the Free Trade group and a contract let for sinking another 100 feet.——The Atlantic City is showing up well. In sinking a new shaft a vein of 3 feet is disclosed. At 100 feet drifts east and west will be run.——Steele & Schieck, on the Big Clara, claim to have opened the same vein from which the Hawk Bros. are shipping $175 ore.

DOLORES COUNTY.

Rico *News*: Shipments from the Enterprise are increasing. Sixty tons were sent to Durango during the past week; 125 miners are given regular employment, and the property is looking better than for months past.——Campbell and Matthews have made a twenty-ton shipment of ore from their Alleghany lease.——R. Johnstone made a carload shipment of lead ore from his Pay Roll property last week.——J. Haughton & Sons are working the Robert E. Lee and Nebraska on Newman hill, at Rico.——The Black Hawk made a shipment of two carloads of ore during the past week.——The Emma gold mine is now making regular shipments. This week thirty tons of high-grade concentrates were shipped. The mill is working and the supply of water is ample.——J. Spurlock has commenced work on a new tunnel on the Grand View properties.——The Colorado M. & C. Co. expects to have its mill completed by August 1st.

GILPIN COUNTY.

Central City *Register-Call*: During June there were shipped from Black Hawk 280 cars of ore, aggregating 5110 tons.——J. B. Hill of Black Hawk has given a quit claim deed to W. E. Rammel of Denver for a one-half interest in the Monarch lode claim, in Mountain House district.——Doud & Fowler have taken a lease and bond on the Gibson and Hard to Beat lodes, 500 feet on the westerly end of the Star of the West lode, and also the east 100 feet of the Star of the West lode, in the sum of $11,000, and will put up a shafthouse and machinery on the Gibson lode and sink it 100 feet, besides other development work.——W. H. Davis, trustee of Arapahoe county, has conveyed to the Ridgewood M. Co., for $40,000, the Rialto claim, in Gregory district.——R. Rutlidge of St. Louis, Mo., has conveyed to the Blagdon M. Co. the Effie, Blagdon, Ezra White, Gem, North Eclipse and Charter Oak lodes, in Russell district.——At the Gold Collar mine the shaft is 500 feet deep, and drifting is being carried on in the fourth and fifth levels. The management report the ore of milling character, but the vein narrow.——Gurley & Roach are working on the Mammoth lode on Mammoth hill, east of the deep shaft, and taking out ore from a winze 160 feet deep. They are making regular shipments of both milling and smelting ores, principally the former.

HINSDALE COUNTY.

The Ute & Ulay mine at Lake City is shipping two carloads of concentrates per day to the Philadelphia smelter at Pueblo.

Lake City *Times*: B. Smith and T. Reed have started up the Tabasco mine where they will finish a contract.——At the Reynolds tunnel ten men are employed.——J. W. Maxey and H. E. Willson of Taylor, Tex., are interested in property in Burrows Park and will visit that section this week to push development work.——L. D. Hubbard of Colorado Springs, H. Weichman and V. K. Ames of Peoria, Illinois, have started over the range to Cimmeron, to inspect the Roscoe Conkling mine in which they are interested.——The center of attraction in Hinsdale county is the Copper mountain region above Rose's cabin. The Big Horn property is being worked under bond and lease by Hongh, Clevenger & Sheridan. The ore body in the breast of the drift is 4 feet wide and with sorting will run $200 to the ton. A carload shipment will be made the first of next week. There is a streak of silver glance running through the vein 2 inches wide which runs up in the hundreds of ounces.——F. House and R. P. McConathy are getting out copper ore from the J. J. Crooke mine on Copper mountain. The ore is shipping grade.

GARFIELD COUNTY.

The Colorado Fuel & Iron Co.'s mine at Newcastle was discovered again on fire July 1st, and the water was turned in to flood the workings. This is the third time the mine has been flooded within eighteen months. The same reason for the fire is given now as has been alleged each time before—spontaneous combustion. The fire originated in room 73 on the east Allen vein, about one mile from the bottom of the shaft. The coal vein is about 38 feet thick at the point of the fire. The coal in room 73, where the fire is known to be, is mined down for a distance of 500 feet from the bottom of the entry. Thus there is a mass of loose coal 38 feet square and 500 feet high, which is on fire.

GUNNISON COUNTY.

In the Gold Brick district is the Teller and Little Chief group of five claims. The Teller is worked by a shaft 170 feet deep, with drifts, and the Little Chief has a 90-foot shaft and a 200-foot tunnel. Good ore has been found in both shafts and tunnel and several carloads have been shipped to the smelters.

The Woodward G. M. & M. Co., operating the Tom Boy and four other claims located in the Spencer district, will develop more extensively. Machinery was purchased in Denver last week. The shaft is 30 feet deep and has exposed a large vein of gold-bearing quartz. The property is near the Gunnison and Underhill mines.

LAKE COUNTY.

Couriers arriving at Leadville July 8th from Red Mountain district, twenty-five miles Leadville, confirm the report of a gold tellurium strike made in the Chishold property at Bramley. The property is on Star mountain and is known as the Little Alec group. Assays show fifty ounces gold and fifty-six ounces silver to the ton. The strike was made after going in 160 feet on the vein, 10 feet of which show a tellurium mineral. The ore is said to be similar to that of Cripple Creek.

The Fourth of July group of claims near Leadville, embracing forty acres of patented ground on Prospect mountain, 1550 feet north of the Dollie B. gold mines and owned by J. Hopkins, J. McLellan and W. and J. Brady, has been taken on bond and lease by a Chicago man. E. B. Weare of Leadville will be Mgr. The bond is for $90,000 and the lease runs for three years. A contract will be let to sink a shaft 200 feet to develop the first contact. It is in the north end of the undeveloped gold belt.

The Adams-Maid-Wolftone M. Co. has been incorporated, the abbreviated name being A. M. W. The capital stock is $50,000. S. D. Nicholson, L. A. Reynolds, J. Rodman, R. J. Donnen and P. Crowe will direct the management for the first year. They will drain and develop this group of mines through the Wolftone shaft.

Leadville *Miner*: The Iron Mask, at Gilman, on Battle mountain, Eagle county, has developed large bodies of sulphides. Mgr. Harrington of Leadville is shipping to the new Highland Boy smelter, at Salt Lake, Utah.——Bartlett & Son have erected on Mt. Elbert, in this county, at the altitude of 10,800 feet, a stamp mill, W. C. Connor of New York furnishing the money. The mill is 36 feet high, the top of the mill being on a level with the tunnel, which is in 1400 feet, driven to develop the ground owned by the Twin Lakes G. M. Co. The mine workings make enough water to run the mill. The ore is a quartz-porphyry and is free-milling material.

Denver *Republican*: June 1 the output of Leadville mines was the largest in the history of Lake county—2400 tons of ore per day, which was stopped by the smelter shutdown. The mines are gradually starting up again.——On Carbonate, Fryer, Iron and Rock hills the Graham Park and California Gulch sections, Leadville, there has been no let up in development. The Iron-Silver has handled an enormous tonnage up to June 10 from their Moyer shaft. The Marian has been shipping heavily and has put its shaft down 150 feet farther into the lower contact, giving it a depth of 1300 feet. A drift is now being run into the ore body.——The Mahala has averaged heavy shipments throughout the six months, and has done much development and put its interior shaft down 50 feet into the ore discovered by the diamond drill; this gives workings at a depth of 1180 feet. New and richer ore the drill shows extends 70 feet below.——The Greenback preperty has sent its main shaft down 1100 feet and is drifting for the Mahala ore chute. The owners have erected machinery. The Mab people have opened large ore bodies and have shipped a heavy tonnage.——In the gold belt, in addition to opening up extensive ore bodies in some of the old properties, new producers have appeared in the President, Fortune, Big Six, Ballard and others, while the pushing of the Yak tunnel into Breece hill, the development of the ore bodies in the Lida and the New Monarch groups, progress of the Board of Trade shaft in Evans gulch, commencement of work by Boston capitalists on the Comstock group, between the Lillian and Antioch, starting of the Gwyndoline group in Iowa gulch, sinking of a deep shaft on the Chippewa group and other enterprises show that the gold belt has been receiving its share of attention. In this territory the Ibex, Resurrection, Penn and a number of other gold producers have been developing and have blocked out bodies of ore from which they can handle a large tonnage when shipments are resumed.

LA PLATA COUNTY.

The Durango smelter is to be blown in again, J. A. Partridge, Mgr., having been directed to canvass for ores.

MINERAL COUNTY.

A strike was made in the Bachelor mine at Creede last week in the intermediate level No. 2, where a 5-foot vein was encountered.

MONTEZUMA COUNTY.

The North Star mill on the Mancos is turning out $1000 per day from two batteries working on ore from the Sundown and Tenderfoot mines. Two retorts sent to the Denver mint from the North Star brought $3916.65—the result of the treatment of 204 tons of ore.

OURAY COUNTY.

Ground is being broken at T. F. Walsh's Camp Bird mine for the erection of a new mill for the treatment of the lead ores.

Ouray *Herald*: The Wedge mine, which was closed down a few weeks ago, will resume operations with a force of eighty men under Supt. McMahan.—— About $200,000 worth of mining property has recently been transferred in this county.

PARK COUNTY.

Park County *Bulletin*: Near Puma are working the Boomer, East Boomer, Plymouth Rock, L. A. S., Barnaby and Belmont, June, No Name, Twelve-Thirty, Copper Bottom and Outlaw, Redskin, Sunday, Campbell & Carlson's copper glance claim, and a number of other prospects.——Near Lake George a number of claims are being developed, among them the Bunker Hill, Morning Glory, Victor, Charter Oak and High Five groups, by G. W. Frost. Assays from workings on these claims have given as high as 22% copper.

SAN JUAN COUNTY.

Negotiations are pending for the purchase of the Menomie group of claims on Boulder mountain, represented by Mr. O'Driscoll, who is the principal owner in the properties, which consist of seven claims in various stages of development. All of the claims are in ore.

The Crooke concentrating mill is running two shifts on Dives-Shenandoah ore, reducing five into one, under direction of Mgr. Crooke.

G. Abbott, et al., have resumed work on the Independence claim, South Lookout mountain. The property has 350 feet of development, which consists of a crosscut and two drifts on the vein.

T. J. Davis & Bro. have a new discovery in their Gold Wing property, Mastodon gulch. The second level has been started on the vein that is 12 feet in width, 3 of which is good shipping ore.

Frank Spellman recently sold one of his claims in the Red Mountain belt for $2500.

It is reported that Wm. Taggart has made a strike in his Stranger near the Occidental group. This vein is said to be 15 feet wide.

Silverton *Standard*: On Sultan mountain the Atlantis, the northerly extension of the Grand Turk, is being developed by a crosscut. It is said that this claim shows yellow copper and galena in all its workings. It is owned by F. Robbins, T. Annear and J. Graff. It is in the limestone-quartz contact, on which is the Copper Queen, the southerly extension of the Grand Turk, owned by J. Woods and Herr Bros. A carload of yellow copper from the Queen is side-tracked in Durango at the smelter. The claim is developed by a 60-foot tunnel, which shows a breast of yellow copper and iron 4 feet wide. The Mezeppa, another contact location, below the Queen, has 2½ feet of yellow copper. This property has been worked through a shaft.——The lower working of the Baltimore, 3½ miles from town, is in a body of ore 8 feet wide, showing iron and copper in quartz, and carries values in gold and silver—not enough, however, to pay for shipping. Mr. Quinn has worked the property for ten years, mostly alone. He has accomplished 400 feet of development.—— The Bonita is a patented claim on Bonita mountain, on the northerly side of the backbone from the Sampson. The development on the Bonita consists of a 200-foot tunnel driven on one side of the vein, which is 30 feet wide. There has been no crosscutting done on the property—the surface showing of which is good.

Silverton *Standard*: The Gold King mill at the terminus of the S. G. & N. Railroad is to have ten additional stamps. J. Hect has the contract.

SAN MIGUEL COUNTY.

Telluride *Journal*: The occurrence of gold in what is called sandstone in San Miguel is reported. It is claimed that assays show from $5 to $17 per ton.

The Ajax mines, comprising a group of five claims on the Smuggler-Union vein, have been sold.

SUMMIT COUNTY.

On the west slope of Bald mountain, five miles west of Breckenridge, is the property of the Mountain Pride G. M. Co., consisting of seven patented and two unpatented claims, parallel to each other. This company is composed of members of the Illinois Steel Co., J. W. Gates president. For three years development of the property has been in progress. In November last year the miners at the Pride uncovered one of the largest bodies of lead ore in the fifth level ever found in the district. In December there was produced 200 tons of smelting and 650 tons of milling ore. The Gold Pan mill was leased and 150 tons were treated there. A mill is being built designed to treat sixty tons of ore daily and will be supplied with concentrating tables and will contain three 60 H. P. boilers, which will supply power for the mill and do the hoisting from the mine and supply power for electricity for a 100-light plant. When Mr. Foote assumed the management of the mine there was no ore in sight. Since that time the old shaft has been sunk 225 feet, 1800 feet of drifting done, 500 feet of upraises made and a large amount of ore uncovered. The smelting ore runs between $40 and $50 to the ton and the milling about $12.

Under the management of F. Graham the Pennsylvania is doing well, and with the starting of the mill, now under construction, the revenues will be increased.

TELLER COUNTY.

The report of the treasurer of the Elkton Co. recently issued showed a total of $2989 construction expenses, June 1, 1898, to June 1, 1899; $10,429.59 mine operating expenses; $273,384.10 mining expenses; $188,904.69 shipping and selling; $12,315.51 salaries and general expense; and dividends of $120,000.

The output of Cripple Creek district for June was $1,092,000. Added to the five preceding months the gross output for the first half of the year amounted to $8,360,253 50.

Cripple Creek *Times*: The El Paso Co. whose claims are on Beacon hill, have their workings in ore, from the Fannie B. on the south, through to the Orizaba No. 2 on the north. On company account the deepest shaft is 220 feet, and from this point all levels are in ore. The chute at the depth mentioned is known to be 125 feet long and in this distance there is in sight a streak of rock varying in width from 1 to 12 inches that is rich. Alongside is 3 feet of rock the screenings from which show a grade of better than $100.——On the Tillery vein, opened on Orizaba No. 2, the showing is good and the lessee is making money.——The Pueblo people who are leasing on the property at 280 feet have a seam of rich ore.——On the Fannie B. some lessees have been working in the old workings of the Blunt Bros., the work on which was done three years ago, and they are making shipments of $100 ore.——The Raven is reported improving. While the greater portion of the men are engaged in development work, enough ore is being shipped to meet the payroll and leave enough in the treasury to pay a dividend of $5000 a month. Last week twenty tons of $300 and 100 tons of five-ounce ore were sent out.——R. P. Davie of Colorado Springs, has bought the Key West property for $35,000, and will organize a company to develop the claim. The property comprises 7.61 acres of patented ground and lies between the Home Fraction of the Temomj Company and the Lone Star claim of the Arcadia Consolidated. It adjoins the Annie Rooney of the Moon-Anchor and cuts into a piece of the Lillie claim of the Franklin-Roy Co. The claim was staked in April of 1893, and patented three years later. At that time $50,000 was refused for it. The company will be organized with a capital of $1,250,000, of which $250,000 will be treasury stock.——A 25-ton shipment has been made from the Whipp & Glenn lease on the Pinnacle. The ore will average from $70 to $90. Connections have been made with the new shaft, and the old workings at a depth of 98 feet. A contract will be let for another 100 feet of sinking.——Tillery and company, leasing a block of the Orizaba No. 1, have a good showing at a depth of 105 feet in an incline. The vein is 4 feet wide and 3 inches of the pay streak is high-grade. On the Modoc the new vein in a crosscut run east has been opened up at the fifth, seventh and ninth levels. From 3 to 9 inches of the pay streak is high-grade ore. Alongside it there is over a foot of medinm grade quartz.——On Isabella ground lessees have opened what appears to be a large vein. Several assays give it a value of $60.

Denver *Republican*: F. W. Baker, managing director of the Venture corporation, has been visiting Cripple Creek, as a result of which an exploration company, to invest in mining in the Cripple Creek district, will be formed in London. The company will have a working capital of from $1,000,000 to $1,500,000. It will buy undeveloped properties, leases and bonds, provide capital for enterprises which need it, and generally invest in the property of the camp.

IDAHO.

(Special Correspondence). — The cyanide plant at Doniphan, twelve miles west of Hailey, belonging to Wiswall & Frank of Denver, began its season's work in May and is in charge of W. H. Wickham. Forty tons per day are being treated, the material consisting of tailings from the Camas No. 2, which yield $5.50 per ton. It is stated that a saving of 83% of the gold is effected. A recent shipment was made of auro-cyanides to Salt Lake City.

In the same locality Doniphan Bros. are developing the Black Cinder group, which is on the mineralized zone trending in an easterly and westerly direction through this section, on which are located the Camas Nos. 1 and 2, Black Cinder, Tip Top, Golden Star and other claims. The Black Cinder has a 250-foot incline shaft, following the dip of the vein, at the foot of which are crosscuts on the ledge in opposite directions. The workings disclose an irregular vein formation, consisting of quartzite and porphyry, with pay streaks of iron and copper sulphides, some of which is partly oxidized. The values are silver and gold with some copper. The workings are to be carried to greater depth.

The Tip Top, belonging to J. L. Packard of Salt Lake City, and in charge of Supt. J. M. Lusk, is well developed through shafts and tunnels and is a steady producer. The 20-stamp amalgamation and concentration mill on this property has been started up within the last month. A considerable percentage of the values in the ores is in the form of free gold, which is saved on the plates, the

values in the sulphides being saved in the different grades of concentrates. The mill, which is modern in its equipment, is running forty tons per day and is turning out 240 tons of concentrates per month.

The Crœsus mine, four miles west of Hailey, was purchased last year by three Spokane and four Eastern men, who took possession Jan. 1st, '99, with W. G. Page as Supt. The property is equipped with a 10-stamp amalgamation mill and concentrators; the mine has 3500 feet of development work, employing thirty-six men. A tunnel crosscuts the ore body 200 feet from the entrance, at which point a shaft sinks 430 feet vertically and the work now in progress consists in driving on the ledge at this level. The ores are high grade copper and iron sulphides, running 4% to 7% copper, $75 gold and eighteen ounces silver; 50% of the values are saved on the plates, the balance in the concentrates. It is said the saving effected is over 90% of all values. As depth is gained the silver values decrease and those of copper and gold increase. Thirty tons of ore per day are milled. Concentrates are shipped to Salt Lake smelters, the freight rate to that point being $4.50, and the treatment charge $8 with allowance of 15 cents per unit on iron excess.

Adjoining the Crœsus is the Hope group, under the management of J. S. Thompson. It is equipped with shaft house, hoisting machinery and other necessary buildings; and is developed by one main tunnel which enters on the vein a distance of 560 feet, also a 123-foot shaft below the tunnel level. The property comprises four claims and its ore bodies and ore values are said to be the same as those of the Crœsus.

The mining industry generally in the vicinity of Hailey is in better condition than it was a year ago. The results seen at the Tip Top and Crœsus are sufficient to justify the assumption that other equally good mines will be opened on the gold belt of this district.

The properties of the Della Mountain M. Co., comprising five patented claims, six miles northwest from Hailey, were purchased by the company in '95, since which time they have produced $75,000. The country rock is granite, the veins carrying galena are 5 feet wide. The values are said to average 74% lead and over 100 ounces silver. The mine is developed by a system of seven tunnels. Ore shipments amount to two cars per month.

The Red Cloud, being worked by lessees, is located on Deer creek, twelve miles from Hailey, and has a good showing of galena ore. Its first-class runs 65% lead, sixty-five ounces silver and $2 gold; second-class runs 15% lead, twenty ounces silver and small values in gold. WASCOTT.

Hailey, Idaho, July 7th, '99.

At the Tiger-Poorman mine Clark & Sweeny will make surface improvements to cost between $100,000 and $150,000. The principal change will be the substitution of water power for steam, saving a monthly outlay of about $5000 for coal. Mr. Sweeny is arranging to construct a flume which will supply water to run the entire plant ten months in the year. W. C. Miller is in charge.

Cuprum *Standard*: At the Columbia mine, owned by the United Copper Co., in Seven Devils, a force of men was recently put to work. A tunnel will be run which will tap the ledge 200 feet in depth.——The Greenvale, another of the United Copper Mines Co.'s properties, has a good ledge of rich ore. J. Walton, Supt. for the company, will do development work on a number of properties during the coming season.

MISSOURI.

Zinc ore at Joplin is worth $42.50 per ton. Lead is $26 per 1000 pounds. The zinc and lead ore produced in the Joplin district since Jan. 1 is valued at $5,575,310.

Joplin *Herald*: The sale of a one-tenth interest in a lease on eight lots on the land of the United Zinc & Lead Co. for $2000 is reported. This one tract comprises seventy-eight lots, which are all leased to miners who pay a royalty of 20% on the gross output to the United Zinc & Lead Co.

MONTANA.

Sheridan *Chinook*: Ore is being sampled at the new smelter at Twin Bridges.——Black, Norton & Berry will ship ore from the Liberty mine on Sand creek this week.——C. P. Richards, a cyanide man from Reno, Nev., is testing the tailings at the Leiter mine.——Morrison & Krause are shipping another carload of ore from the St. Lawrence mine.——McEvoy & Co. are working on the Largey mine near Brandon and have shipped several loads of ore to Twin Bridges.——J. Olson and A. Fisher have out a shipment of ore from the Big Chief mine near Brandon. They intend having it sampled at the new smelter near Twin Bridges.——Fuller & Lewis have commenced work on the old Harkins mine on Mill creek. They will run a new tunnel to tap the lead, which is of high grade, carrying a good percentage of lead.——The Glendale Transportation Co. is hauling ore from Hecla to the smelter. Last week it averaged eighteen tons to each ten-horse team with two wagons.——C. E. Gable, Mgr. of the B. & G. M. Co., in the middle fork of the Warm Springs district, has returned from an extended trip to Boston, New York, Chicago and other Eastern cities.——A. Engstrom, R. Baumgart and S. Williams have finished running eighty tons of ore from the Gold Coin mine on Indian creek through the mill. The ore ran well. They have a group of mines above the mill, consisting of six claims, upon which they have development work done. The Gold Coin shows high-grade gold, silver and copper ore at a depth of 250 or 300 feet, having been tapped with a tunnel at that depth.

Butte *Inter-Mountain*: Advices from Garnet report the timber and brush cleared away on the site for the Montana-Colorado smelter, and the work of excavating commenced. The plant will be situated a few yards up Deep gulch, off Bear gulch, a few miles below Garnet, and not far from old Beartown. A. P. Browne is interested and has for his associates Missoula men. The plant will treat custom ore from the Garnet, Coloma and Top o'Deep mining camps.

NEVADA.

The new hoisting machinery at the Osbiston shaft on the Comstock lode at Virginia City was completed and ready for operation Saturday last.

On the Comstock pumping operations are continued successfully; the water has been lowered since last week more than 4 feet. Supt. Ross' report by telegraph is as follows:

"*To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco*: Elevator No. 1 has been working continuously. The water rose and fell during the past twenty-four hours. At 6 A. M. to-day the water was 1 foot below the 1950-foot level station."

At Gold Hill general repairs to the north surface tunnel, and also to the west crosscut from that tunnel, are still being continued at the joint expense of the Confidence, Challenge Con. and Con. Imperial mining companies.

In the Belcher mine on the 100-foot level miners are cutting out a station for the purpose of prospecting at that depth. On the 1000-foot level the east crosscut is out 193 feet. The face shows porphyry. On the 1100-foot level they are cleaning out and repairing the Belcher, Crown Point and Yellow Jacket drift. There have been hoisted during the week and stored twenty-nine mining carloads of ore, the average top car sample of which shows an assay value of $12.59 per ton.

The copper-bearing zone of Jackson creek district in Humboldt county is said to be 150 wide. Judge Burton and J. F. Cowan of Salt Lake, Utah, have an option on eleven undeveloped locations.

NEW MEXICO.

Santa Fe *New Mexican*: F. Lucero has made a copper strike on his ranch in the San Andres mining district.——Several fair copper prospects have been staked off in the Caballo range.——Organ mining camp is prosperous. Several houses have been built and the hillside is dotted with tents. The change is due to the success of the Excelsior M. Co.——A camp has been established at Mineral Hill, and Condit and Chambers are working the Dumma B. mine. The ore carries 60% lead, in addition to gold, silver and copper.——J. M. Fritter and R. Worthen have thirty-two men employed on the west side of the Montoya mine. They are taking out low-grade copper ore for Crawford & Derbyshire. At a depth of 50 feet a body of ore has been partially explored by 1600 feet of drifts run in various directions from the shaft. These drifts have produced 3000 tons of ore. The ore runs 6% to 8% copper. Ninety-five tons are taken out every day.—R. L. Powell is putting the 10-stamp mill at Gold Hill, owned by Dr. Woods, into shape for working the gold ore in sight in the California, Nancy Lee, Chief, Little Charley and Standard mines. The ore will average an ounce and a half in free gold, which will be saved by amalgamation on the plates. The concentrates will run five ounces gold per ton.——J. Woodward has three miners on the Big Casino mine at Bald mountain and is shipping ten to twenty tons of ore per week to Silver City. The ore carries twenty to forty ounces silver.——Ashton, Roach & Williams have sub-leased their ground on the Montoya mine. High-grade copper is being taken out.——Ashton, Roach & Hoskins have thirty-five men employed at the north end of the Romero mine at Santa Rita, taking out rich copper ore.——H. Dawson has fifty men employed on the leased ground upon the 100-foot level of the Romero mine, mining rich copper ore.——B. C. Gillette has sunk the incline shaft of the Copper Rose at Hanover to 175 feet. He is developing the property under bond and lease from J. Clark and J. A. Lucas.——Crawford & Derbyshire are running their concentration mill, concentrating ninety tons of ore daily, producing eight tons of copper concentrates. The monthly product of the mill is $25,000.——An $8000 shipment of ore was made recently from the Lookout mine near Hillsboro.——B. Martin will put in a cyanide mill at the Blaine, McKinley and Hanlon mines near Hillsboro.——At Robins & Hilty's Trujillo Creek mine, near Hillsboro, the water has caused a suspension of operations until pumping machinery is secured.——R. Watson, who leased the Richmond, struck a 3-foot vein of $95 ore.——A 50 H. P. gasoline hoisting engine has been placed at the Trippe mine, and it hoists thirty tons of ore a day.——The gold production of the Hillsboro placers amounted to $3000 last month.

OREGON.

(Special Correspondence).—The name of the Union-Companion Mines has been changed to the Cornucopia Mines. The company has commenced to erect a cable tramway from their mill to the Last Chance mine; the distance is two miles over rough mountains. Finch and Comel of Spokane, Wash., have broken ground on a mining enterprise adjoining the Cornucopia Mines.

Graham, Garratt & Co., of Spokane, Wash., have an agent here looking over the mining district of Cornucopia. He has taken the group of J. Arthur, known as the Golden Drop Con.

Cornucopia, July 5th, '99.

Sumpter *American*: The Gold Boy group of five claims, adjacent to the Bonanza, has been bonded to the Spokane Co-operative M. Co. The owners are I. Williamson, J. W. Duckworth, P. W. Rose and W. S. Granel. The bond is for $60,000. The first payment is due in December. A crosscut tunnel is in 250 feet and a contract has been let for 120 feet.

Ashland *Record*: Miners have struck the ledge in the Free Coinage mine in Sampson Creek mining district near Soda springs. The 320-foot tunnel entered the ledge at a depth of 200 feet from the surface. It was 5 feet wide. The ore carries free gold and zinc and lead sulphides. There are specimens exhibiting native silver. This ledge is also known as the Barron and Shepherd and is eight and one-half miles southeast of Ashland, and was the first gold-bearing ledge found in that section of the county.——The Shorty Hope M. & M. Co. is about to sink 1000 feet on their property near Ashland, and will determine the character of machinery that will be purchased. The shaft will be sunk on the line between both locations, and it is now 60 feet below the level of the present workings; 1000 feet of drifting has been done on the vein. The business of the company in Ashland and at the mine is looked after by Pres. H. S. Sanford and Supt. T. James.——Supt. H. Mattern, of the Ashland and Mattern mines, has shipped a carload of ore and concentrates to San Francisco. It was from the new workings in the west side shaft, from which $30 per ton was realized by the last run through the 5-stamp mill in Ashland. The mine is opened by a 400-foot tunnel that struck the vein at a depth of 150 feet from surface. A 500-foot tunnel reached the vein at a depth of 500 feet and did considerable drift work in low-grade ore. The owners are G. F. Reynolds of Cheboygan, Mich., and R. M. Bennett of Minneapolis, Minn. They paid $20,000 for the mine a year ago. Mr. Bennett and Mr. Mattern are the owners of the Mattern mine, from which some high-grade ore has been taken.

Baker City *Republican*: Rich discoveries have been made near Baker City, 2½ miles southerly from the Virtue mine. Another discovery was made northwest of the Virtue by a stranger.——A strike was made a few days ago by two strangers a few feet from the old Wilson claim on Dalles military road, in Malheur county, seventy miles from Baker City. It was considered outside of the mineral belt, and was discovered years ago by Wilson, who, after development work, gave it up, not finding gold in paying quantities. Now two strangers open up the richest quartz seen in years. The rock is quartz, full of gold.

SOUTH DAKOTA.

Deadwood *Pioneer-Times*: Day and night shifts are working in the Golden Slipper shaft in the Harvey Peak region. The ledge has been encountered in the shaft again.——The water has again risen in the Sunnyside mine and work had to be suspended.——The Ella Eldon M. Co. has awarded a contract to A. C. Tippy and H. Brasch of Deadwood and J. F. Gilroy of Lead to sink a shaft upon its Grizzly gulch property to the depth of 100 feet.——I. Dowing and associates, who have a lease on the Belle Eldridge and adjoining claims on Spruce gulch, belonging to A. Dunn, H. A. Tortat and J. W. Allen, are taking out eight tons of ore daily, and are shipping to the smelter. They have opened up a good-sized body of ore and the property is paying.——Allen, Small, States and Souley have the building for their cyanide plant at Ragged Top enclosed and are building their vats. Their engine and boiler are in place. They have a new crusher and rolls.——The diamond drill run by the American M. Co. in the Dacy shaft is in mud shale and making slow headway, it being hard to core, but has gone more than 200 feet since starting. The drill is approaching the upper quartzite.

Custer *Chronicle*: Men at the Russell mica mines, five miles east of Custer, are clearing the mine of water preparatory to resuming work on the same. The property is owned by the St. Louis Mica Co.

UTAH.

BINGHAM DISTRICT.

(Special Correspondence).—W. H. Coolidge, E. A. Clark, C. H. Cole and associates, who purchased the Old Jordan & Galena, Old Telegraph, Niagara and other properties at Bingham, organized the United States M. Co., which took over the entire properties, consolidating them under one management. The holdings comprise 750 acres. The Old Jordan is said to be the oldest location in the district, if not in the State, and is extensively developed. Its ore zone is over 250 feet wide, being a contact between lime and quartzite, the ore being iron and copper sulphides, carrying gold, silver, copper and lead.

The Old Telegraph group is also well developed, having been worked by lessees for years, who took only the high-grade material, leaving great bodies of low and medium grade ore blocked out. The properties are equipped with machinery, including a 200-ton concentrator and 100-ton cyanide plant. Changes are being made in the mill and other preparations are making for extensive work. Jas. W. Neill is general manager of the company and A. P. Mayberry mine superintendent.

Bingham, Utah, July 1st, '99. WASCOTT.

TINTIC DISTRICT.

(Special Correspondence).—Figures accurately compiled by the Tintic *Miner* show the following shipments from the district for the week ending this date, the Tintic district comprising the mines of Eureka, Mammoth, Robinson, Silver City and Diamond:

Bullion-Beck	10
Gemini	9
Godiva	5
Uncle Sam & Humbug	6
May Day	2
Northern Spy	1
Star Consolidated	4
Mammoth	5
Grand Central	11
Swansea	12
South Swansea	5
Sunbeam	2
Joe Bowers	1
Dragon Iron mine	50
Total cars ore	123

The Mammoth also shipped five cars concentrates.

By the above figures it will be seen that the old shippers are keeping up their pace and that some of the new ones have increased of late. A marked feature of the district is the new work in progress. Not less than twenty-five new hoisting plants have been set up in the district within the last six months on that many new properties. The result will probably be the addition of a number of shippers by the close of the year. Especially around Silver City is this new work noticeable. At Diamond the same condition prevails. At the Eureka end of the district work is progressing on a chain of new properties extending northwesterly five or six miles, on which it is designed to catch the zone of ore trending through Mammoth and Eureka. Among these new properties are the Ridge & Valley, Illinois, Raymond, Black Warrior and Jefferson. On some of these ore is said to have been encountered.

The Diamond locality is interesting by reason of the development of the Joe Bowers, Buckeye, Blue Bird and others.

The Grand Central, in charge of Supt. P. Donnelly, has its new double-reel hoisting plant in operation over the two-compartment shaft. A new ten-drill compressor is also installed and ready for use. The shaft sinks to 900 feet depth, from which levels are run at different stations to the vein, the latter being opened a distance of 450 feet vertically. It is stated that the ledge is 60 feet wide at some points. The ore values are in gold, copper and silver, the copper running as high as 15%. The main shaft is to be sunk 200 feet deeper.

The Emerald, in charge of Supt. M. L. Oglesby, did 1400 feet of development the past year. Its shaft is 700 feet deep and drifting is in progress on the fifth, sixth and seventh levels.

The Tintic M. & D. Co. are making steady progress with the Sioux-Ajax tunnel, being driven from the upper Mammoth side of the Tintic range, crosscutting the formation toward the Northern Spy, on the opposite side. It is in over 5000 feet. The work is in charge of W. J. Craig.

The Dragon Iron mine is under bond and lease to S. Newhouse and associates, the sum named in bond being $300,000. It seems certain that the sale will be consummated. The main workings consist of two crater-like quarries, on the slope of the mountain, reached by a tunnel from without, through which the ore is carried by wagons. A second tunnel connects the open cuts. The face of the workings disclose large ledges of black and brown oxide of iron, with streaks of talc and lime. It is used as fluxing material. The ore body thus exposed is 200 feet vertical by 1000 feet laterally. At another point on the same group the operators are sinking a 1000-foot shaft, machinery for which has been set up.

Within the town of Silver City the Cleopatra has set up hoisting machinery and sunk a shaft over 200 feet, from which crosscuts run to the ore, presumed to be the same lead as that opened by the Swansea and others farther north. W. W. Chisholm, R. T. Dart, A. S. Day, J. A. Bard and C. J. Pence are interested.

Paxman, McGlynn and others are developing the Sea Swan, north of Silver City. A 240-foot shaft is sinking to catch the Swansea vein.

The Rabbit's Foot, east of Silver City, is shipping from its 350-foot shaft an oxide of copper and iron, carrying gold and silver.

The Hope mine, in charge of J. G. Sawyer, is developing through a 175-foot incline shaft, from which crosscuts lead to veins on each side.

The Martha Washington expects to start shipping this month. It is developed through a 500-foot incline and various levels connected by winzes.

The Bullion-Beck mill is operating on second-class ore from the dump of that mine, which runs from 5% to 7% lead and 8 to 12 ounces silver. It is partly carbonate and partly sulphide ore. This mill is equipped for concentration. The dry siliceous ores from the Bullion-Beck, carrying little or no lead, are to be milled at the Farrell mill at Robinson, which is equipped for amalgamation as well as concentration. This class, of which 6000 tons have accumulated, will run 20 ounces silver.

The Eureka Hill mill—the largest in the district—is temporarily idle, pending the present exploration of the mine for additional ore bodies.

L. C. Doty is in charge of the work of the Apex M. Co., which is opening a property between the Godiva and the Uncle Sam. A tunnel has been driven in 2000 feet, where a body of low-grade ore was cut at 700 feet vertical depth.

The Bullion-Beck Tunnel Co. (not identified with the Bullion-Beck mine) have made a regular tunnel location east of the Godiva and Humbug, and have driven a tunnel, crosscutting the formation 1400 feet toward the Humbug. In the course of the work a natural cave, with porphyry and limestone walls, was discovered. It is 150x200 feet laterally by unknown vertical dimensions.

J. Earle has resigned the superintendency of the Mammoth mine.

The Four Aces, near Silver City, is now equipped with one of the best hoisting plants in the district. The property has thus far produced sufficient to pay for improvements and operating expenses. WASCOTT.

Eureka, Utah, July 1st, '99.

(Special Correspondence).—The Ontario at Park City is operating with sixty-five men, shipping fifty tons of ore per day, which comes chiefly from stopes between the 1400 and 1500 levels. This ore is high grade, being silver, gray copper and galena, zinc blende and pyrites.

The Daly-West has recently been shipping at the rate of one hundred tons per day, though its normal rate is sixty-five tons. Its ores run approximately sixty ounces silver and 15% to 25% lead. At their mill concentrates run 40% lead.

Park City, Utah, July 3rd, '99.

(Special Correspondence). — The Bingham Tunnel Co., A. G. Lamson Mgr., are driving a tunnel from the valley side of West mountain, in a westerly course, cutting under the New Mammoth, Fortune and Wall-DeLamar groups, coming out in Bingham canyon, above the town of Bingham. It is now in one-third

of a mile, size 9 feet vertically, by 8 feet wide. It is designed for drainage and transportation of ores to the valley side, where a smelter is contemplated. Parties concerned in this enterprise are in control of the Jordan Narrows electric power plant, and electric ore haulage through the tunnel is one of the contemplated features. WASCOTT.

Bingham, Utah, July 3rd, '99.

(Special Correspondence).—A. G. Bast is developing a number of mining properties in the State Line district, reached by a sixteen-mile stage ride from the Utah & Pacific Railroad, which has been built seventy-two miles in a southwesterly direction from Milford. Mr. Bast says the ores there are free milling in character and the country affords plenty of wood and water. WASCOTT.

Salt Lake City, July 3rd, '99.

The Horn Silver mine, at Frisco, is producing about 1200 tons of ore per month.

Utah's mines distributed $280,000 dividends in June.

The strike at the Highland Boy smelter is over. The dissatisfied men were paid off and new men employed to fill their places.

It is reported in London that Capt. J. R. DeLamar is about to sell his entire Mercur property to a syndicate of French and English capitalists for $14,000,000. H. A. Cohen, who is looking after the DeLamar interests in Utah, denies the report.

Salt Lake *Tribune*: For the entire holdings of the Star Con. M. Co. at Tintic, an Eastern syndicate, represented by local parties, has made an offer of $500,000, or $1 a share for the stock. It is willing, on the same basis, to take 400,000 shares, but unless that number can be delivered the right to withdraw the proposition is reserved. The bid has been referred to the shareholders.

Bingham *Bulletin*: As a result of developments occurring in the consolidated mines of Bingham this spring, announcements have been made by the United States, Boston Con. and De Lamar managements that they will erect reduction works for treatment of their ores.

WASHINGTON.

In the Mount Stewart section of the Cascade mountains, a tunnel on the properties of the Spokane Copper M. Co., consisting of a group of four claims, is in 60 feet, the face of the tunnel being in ore, with neither wall in sight. The ore is sulphide of copper and iron, running in gold and silver. In this camp the following properties are being worked and shipping ore is being extracted: The Maud O., Lynch, Eureka, King Solomon, Grand View and Ida Elmore.

The Acme mine, fifteen miles down the river from Marcus, has been sold to California parties, who are at work on the property.

D. C. Clark, who has charge of the Silver Chief property in Stevens county, near the Cleveland camp, has arranged for sorting ore as it is taken out.

C. D. Lane and A. Hayward of San Francisco have purchased a group of seven gold claims at the head of Slate creek in Whatcom county, from M. Curtis, their discoverer. The ledge is 25 feet wide and runs through several claims. The property was discovered in 1895.

Republic *Pioneer*: Preparations for building a mill on the Mountain Lion have begun. The plant will include stamps and cyanide plant.

Spokesman-Review: Development of the Insurgent has demonstrated that the cross vein which was followed by the Lone Pine Co. to the Insurgent line, and then followed by the Insurgent people into the latter property, does not run into the Last Chance. The Insurgent is a wedge-shaped fraction lying between the Lone Pine and Last Chance. The latter claim is the property of the Lone Pine Co. A series of cross veins running east and west constitute the ore chutes of the Lone Pine. These run into the Insurgent. In following the one mentioned it has been found to turn to the north, following the slate at the point where the formation changes. It will not enter the Last Chance ground.

WYOMING.

Grand Encampment *Herald*: Articles of incorporation have been filed with the Secretary of State for the Hercules M. Co., a Nebraska corporation, which will develop mines in Grand Encampment district. The incorporators are Omaha men and the principal office of the company is at Omaha.——W. C. Ledbetter has opened up a vein of ore on a claim at the head of Cow creek. The ore runs in silver and copper. The vein is large.——At C. A. Finley's claim, near Grand Encampment, the quartz has given place to a red, decomposed iron similar to the capping of the Ferris-Haggerty mine, and the walls are impregnated with copper sulphides.

FOREIGN.

BRITISH COLUMBIA.

It is reported that the only developed iron mine on the Pacific coast has been sold to John D. Rockefeller, the purchase being made by the Monte Cristo M. Co., which Rockefeller owns. The mine is situated on Tuxedo island, off the British Columbia coast. The price is said to have been $150,000. The mines lie within 200 feet of tidewater.

The trouble between the miners' union and the Ymir mine has been overcome by means of contract work. Nearly all the work on the mine will be let by contract henceforward, and it is understood that the contractors will pay their men $3.50 for eight-hour shifts. The stamping operations have been uninterrupted by the strike, and 300 tons of concentrates have been shipped to the Hall smelter at Nelson, to which also a contract has been let for smelting the output of crude ore for one year.

P. J. Hickey, Mgr. of the Fontenoy mine in Camp McKinney, says the shaft is down 100 feet, and 20 feet deeper they will drift on the ledge, which is 9 feet.

The Sunshine Co., Ltd., which owns the Silver Cup, Sunshine and adjoining properties in the Trout lake division, has received from the Trail smelter $16,948.34, being the proceeds (after deduction of freight, duty and treatment charges) of 160 tons of ore, one carload being from the Sunshine claim and the balance from the Silver Cup.

Work has commenced on the Nelson-Poorman group, at Ymir. The work will be done by contract. Twenty men are employed.

CANADA.

Copper ore has been found in the Barry Sound district. The discovery was due to an American mining expert named Forbes, who has organized two companies, one composed entirely of St. Paul capitalists and the other composed of Canadian and St. Paul men, which have secured all of the claims in the neighborhood and have commenced operations.

LOWER CALIFORNIA.

Attorney L. A. Wright of the Fortuna and La Republica companies reports from San Diego, Cal., the starting of the second stamp mill of La Republica.

SOUTH AFRICA.

At the Jagirsfontein diamond mine a cave of 1000 tons of rock from the rim of the crater-like cut killed and injured a number of workmen.

THE KLONDIKE.

Ex-Postmaster Lewis of Chico, Cal., writes: "I want to again warn any and all persons that have an idea that they can come here and make a fortune, that they are taking the chances of being one out of a hundred. Stay where you are. All the gold that has come from the Klondike would not pay men to go through the same experience that I have seen them go through. There is a party of eleven men from Boston living next to me who have the reputation of being the best workers in camp. They have sunk forty-two holes from 28 to 89 feet in depth, and drifted over 150 feet. The gross returns for all this labor, besides building cabins, hauling their grub from one camp to another, with the thermometer ranging almost 40° below, were $1.35. This is only one party—the are dozens more in the same boat."

G. T. Hall and associates of Seattle, Wash., have sold 540 acres of mining land on the Yukon to Boston and London capitalists for $240,000. The land lies back of Eagle City. A hydraulic plant will be put in.

Industrial Notes.

—Coulterville, Cal., will be rebuilt.

—Prescott, Arizona, is being rapidly built up.

—American capitalists will buy the new Mexican bonds.

—A $700,000 sugar beet plant is projected at Santa Fe, N. M.

—There are 953,138 acres public land in Los Angeles Co., Cal.

—Nelson, B. C., will put $60,000 into public water works, etc., this season.

—Since annexation to the U. S., 12,000 Japanese have emigrated to Hawaii.

—Montana and Wyoming are going in for irrigation projects on a very large scale.

—The Southern Pacific Co. talks of a $50,000 California display at the Paris Exposition.

—There is great demand in Salt Lake City, Utah, for additional labor at mines and smelters.

—A mortgage given by the Kootenai Railway & Navigation Co. for $2,400,000 has been filed at Rathdrum, Idaho.

—"Tons of gold" are reported arriving from the Klondike, but they never get farther than the incoming steamers.

—The Cygnet Petroleum & Development Co., with $90,000 subscribed, will develop the 2566 acres in the Fresno, Cal., oil belt owned by the company.

—At Visalia, Cal., is being placed a large electric motor at the city water works for pumping. The Mount Whitney electric system is in operation.

—The Colorado Springs & Cripple Creek Ry. Co., has incorporated at Colorado Springs, Colo., capital stock, $2,000,000, to build a short line between the two places.

—A flying machine to weigh 10,057 lbs. and operated by compressed air is a projected feature of the exhibition at the next fair of the San Francisco Mechanics' Institute.

—At Marysville, Cal., 200 men are making roads leading to the new site of the Yuba Electric Power Co.'s light and power plant at Dobbins' ranch, forty miles from there.

—A. J. Coram, Prest. Cochiti G. M. Co., is arranging to put in a $250,000 electric plant at Bland, N. M., and transmit power thirty-five miles to the company's works in Calla canyon.

—The United States Smokeless Powder Co. will put in a new $500,000 plant at Point San Pedro, Cal. Two hundred men will be employed. In addition to powder, nitroglycerine will be manufactured.

—A formal contract has been signed whereby J. P. Morgan & Co., S. Bleichroder, the Deutsche Bank, the Dresdener Bank in Germany, and J. S. Morgan & Co., London, undertake the conversion of the entire foreign debt of the republic of Mexico.

—The British survey steamer Egeria is at San Francisco from Esquimalt, B. C. The English and Canadian governments are to establish a cable between British Columbia and Australia, which will touch at Samoa and Hawaii. The Egeria is now engaged in surveying the route. She will go to Honolulu, taking soundings on the way, and after coaling there will proceed to Apia. From Apia the soundings will be taken to the nearest point on the Australian continent.

—In New York, Pennsylvania and Ohio the purchase of forsaken and wornout rust piles, called "iron works" or "rolling mills," at a low price, rubbing up of the old machinery and with a hurrah putting it into a stock company at an enormous advance and selling it in stock to the gullible public, who have taken the money from legitimate places to get rich suddenly, is a fashionable mode of some people to get rich. It will furnish chances for lawyers to get rich over the wreck, and the certificates will be found by the executors in boxes, as old mining certificates are now.

—Bids on the new boilers for the lighthouse tender Madrone were as follows: Union Iron Works, San Francisco, $14,500, time three months from receipt of material at yard in San Francisco; W. J. Brady, San Francisco, $16,750, time May 1, 1900; Wolfe & Zwicker Iron Works, Portland, Or., $16,966, time 180 days; Moran Bros. Co., Seattle, Wash., $17,049, time 120 days; T. J. Moynihan, San Francisco, $17,990, time nine months; P. F. Dundon, San Francisco, time seven months; Risdon Iron and Locomotive Works, San Francisco, $20,980, time six months; Fulton Engineering and Shipbuilding Works, San Francisco, $21,190, time 150 working days.

Personal.

JAS. DONAHOE is the new Supt. Mammoth, Utah, mine.

J. A. EDMAN of Plumas Co.. Cal., is visiting San Francisco.

LOUIS JANIN JR. has returned to San Francisco from Australia.

V. V. CLARK is the new Supt. at the Albemarle mill, Bland, N. M.

THOS. TEAL has been engaged as assayer at the Twin Bridges, Mont., smelter.

F. F. THOMAS, Supt. of the Gwin mine, Calaveras Co., Cal., is in San Francisco.

W. O. FROST of San Francisco, Cal., has gone to his mines near Downieville, Sierra Co., Cal.

CHAS. G. YALE will have charge of the California mining exhibit at the Paris Exposition.

L. S. J. HUNT, formerly of Seattle, Wash., is amassing wealth in mines at Chambulo, Korea.

W. S. THYNG has charge of the mining department at the Pullman, Wash., school of science.

A. C. KYLE succeeds the late Roger Prendergast as Supt. Bullion M. Co., Virginia City, Nev.

ROSS BROWNE has returned to San Francisco, Cal., from a professional trip to El Dorado Co., Cal.

E. H. BENJAMIN has returned to San Francisco from a trip to the Ralston Divide, in El Dorado Co., Cal.

F. M. WIGMORE, representing John Wigmore & Sons Co., Los Angeles, Cal., is visiting San Francisco.

LETSON BALLIET, Mgr. Alder Creek mine, in Placer Co., Cal., has returned to the mine from an Eastern trip.

MR. J. L. WETMORE, JR., is foreman and assayer of the Azurite Copper & G. M. Co., near Tucson, Arizona.

E. N. WALTER of Denver, Colo., is preparing plans for a copper smelter for mining companies at Bingham, Utah.

F. CHAPPELLET, SR., of San Francisco, Cal., has gone to the Eureka Con. mine, near Forest Hill, Placer Co., Cal.

JOHN PENBERTHY, late manager of the Real del Monte, Huanchaca, goes to Siam to take charge of a mining property.

GEO. H. EVANS has returned from South America and is in present charge of mining operations at Breckenridge, Colo.

E. I. PARSONS, representing Jno. A. Roebling Sons' Co., San Francisco, has returned from a business trip through the Northwest.

J. E. JACKSON has resigned the presidency of the Salt Lake, Utah, Mining Exchange; going to the City of Mexico as Mgr. Mexican Ore Co.

W. H. BREVOORT, Pres. Victor M. Co., Cripple Creek, Colo., has been in Tintic district, Utah, examining the Carissa mine. He is now in California.

ON the 28th inst. E P. Ripley will succeed Claus Spreckels as Pres. S. F. & S. J. V. R. R., consequent upon the absorption of that road by the Santa Fe.

MARCUS DALY denies reports of his intended relinquishment of active interest in the Amalgamated Copper Co., and says he will remain in Montana.

FRED HOWE BOSTWICK, representing the Hendrie & Bolthoff Mfg. Co., Denver, Colo., was in San Francisco last week en route to Salt Lake City, Utah.

Mr. W. W. OLIVER left Denver, Colo., last week to take charge of the Dwight Furness Co.'s mill, built by the Edward P. Allis Co., at Guanajuato, Mexico.

THE Pretoria, South Africa, *News* says that John Hays Hammond "has a retainer of close on £50,000 for putting the Randfontein group of mines on a proper footing."

GEO. E. HOGG, M. E., of New York and San Francisco, sails for Cape Nome and Golovin Bay in the interests of several San Francisco companies, who have locations in the above named districts.

WILLIAM FRANCIS of Soulsbyville, Cal., who has been in charge of the Shakespeare M. Co.'s property, near Lordsburg, N. M., has returned to California and is succeeded as Mgr. by A. Logan of San Francisco, Cal.

DEAN P. MITCHELL, who has been in Western Australia for the past two years, is in San Francisco, Cal., recuperating. He will visit several of the mining regions of the Southwest before returning to Australia.

HON. NILES SEARLS has been re-elected Pres. Society of California Pioneers; Vice-Pres., E. W. McKinstry and J. Palache, San Francisco; W. Van Dyke, Los Angeles; G. Hagar, Colusa; D. O. Mills, New York.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 4, 1899.

628,430.—PAPER FILE—Bireley & Simms, Los Angeles, Cal.
628,219.—WATER LIFT—R. E. Browne, S. F.
628,267.—WINDOW SASH LOCK—W. A. Hawthorne, Carson, Nev.
628,223.—FARE REGISTER—S. C. Houghton, S. F.
628,224.—ROPE CLUTCH—S. C. Houghton, S. F.
628,178.—MACHINE FOR FILLING PACKAGES—J. M. Howe, S. F.
628,104.—WINDOW—J. B. Marshall, Fresno, Cal.
628,250.—PLATE HOLDER—G. & M. Maybell, S. F.
628,185.—FINGER TOOTH BRUSH—C. W. Richards, S. F.
628,212.—FRUIT DRIER—E. F. Schneider, North Yamhill, Or.
628,360.—STOCK FOR FIRE ARMS—O. O. Scripture, Prescott, A. T.
628,127.—IRRIGATING SYSTEM—W. H. SHINN, Los Angeles, Cal.
628,149.—SPRING MOTOR—C. Sinclair, Hawthorne, Nev.
628,375.—STAPLING MACHINE—N. S. Wakefield, Pomona, Cal.
628,055.—TRACE CLASP—I. Whealdon, Planview, Or.
31,149.—DESIGN, SHAFT IRON—F. L. Lowe, Orting, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FINGER TOOTH BRUSH.—C. W. Richards, San Francisco, Cal. No. 628,185. Dated July 4, 1899. This invention relates to a brush for cleansing the teeth. It consists essentially of a removable tip which may be fitted upon the finger or upon a handle of any description, this tip having bristles or like cleansing devices affixed to the exterior end and adapted to cleanse the teeth. The points of the bristles are made converging so that they will enter crevices between the teeth and the rubber or elastic tip protects the teeth from being struck by the handle when used therewith, and when used upon the finger it gives a very convenient and flexible means for cleaning the teeth.

MACHINE FOR FILLING AND FOLDING PACKAGES.—John M. Howe, San Francisco, Cal. No. 628,178. Dated July 4, 1899. This invention relates to an apparatus which is designed to form packages from long strips of paper and fill the packages with powder or other material. It consists of a stationary table or carrier, a slide, a crank shaft and pitman connecting with the slide to reciprocate it, and connections by which the feeding mechanism is reciprocated from the main slide. A vertically reciprocating folding plate is actuated by a bell crank lever connected therewith, and a pin on the crank shaft engages the lever and depresses the plate at each revolution of the crank shaft. Material to be filled into the packages is supplied from a suitable hopper and the edges of the strips are turned up and folded over the material.

Commercial Paragraphs.

F. A. HUNTINGTON has this week shipped four Huntington roller mills to the Western Iron Works, Basin, Montana; also one mill to the App Con. M. Co., Jamestown, Tuolumne Co., Cal.

CHAS. B. BOOTHE & Co., 126 South Los Angeles street, Los Angeles, Cal., Schaw, Ingram, Batcher & Co., 27 Main street, San Francisco, Cal., and 219 J street, Sacramento, Cal., are agents for the Jackson Drill & Mfg. Co., Denver, Colo.

CONTRACTS were closed by the Denver office of the Edward P. Allis Co. last week for a 100-ton concentrating mill for the Colorado Milling & Concentrating Co., Rico, Colo., and for a 50-ton cyanide mill for the Nevada & Utah Exploration M. Co., Norris, Montana.

Obituary.

PATRICK KERVIN, a well-known mine operator, died at San Jose, Cal., on the 11th inst., aged sixty-one. He had for some years been Supt. of Con. Virginia, Best & Belcher, Gould & Curry and Utah mines in Nevada. For a number of years he was Supt. of the Ontario mine at Park City, Utah. He returned to the Comstock in '88.

Like A Home In Oakland?

A nice home for your family in a choice part of Oakland. Good schools and churches. Forty minutes from San Francisco. Climate perfect. A cosy cottage built with special view to convenience for the owner's own use. Five large rooms and large, well-lighted attic and servant's room. Good laundry separate from house. Large grounds and fruit trees. Price $3500, or to rent for $25. Three adjoining lots very cheap. Easy terms. This is a very sunny, cheerful place. Address A. L. T., this office, or call at 1601 8th Ave., East Oakland.

Amalgamated Copper Plates.

TO THE EDITOR:—I desire to call your attention to the fact that the article on "Amalgamated Copper Plates" credited to me in your issue of July 1st was written and first printed in 1871, when silver-electroplated copper plates had just begun to be used, and when many mill men thought them too expensive and, frequently, "no good." But, wherever applicable, the methods and results therein set forth are just as true and valuable to-day as then.

Especially is this the case where, as far too often seen, the coating of silver has been worn or peeled off and the base copper exposed, or only covered with an exceedingly thin film of mercury on a smooth, hard surface, occasionally heightened by the too liberal application of solution of cyanide of potassium. It seems almost superfluous to say that ignorance and laziness are the causes of these conditions.

Either replace the old worn plates with newly silvered plated plates or give them such treatment as will cause them to hold more mercury and amalgam.

A word or two as to the preparation of silver amalgam: In 1871 it made little difference in cost of the amalgam whether coin, granulated or sheet silver was used. But now an equal weight of silver in coin costs twice as much in gold as it does in the other shapes. The copper in the coin does not get into the amalgam. It is a pure amalgam of silver and mercury, if the latter be pure.

After dissolving the silver in nitric acid it need not be crystallized, but the mercury may be submitted to its action by putting it into the vessel containing the silver solution, or vice versa.

The action is this: Some of the mercury, the chemical equivalent quantity, displaces the silver by appropriating its NO_3 and entering into solution to form mercuric nitrate ($Hg2\ NO_3$), and the precipitated silver is absorbed by the free, unappropriated mercury. About equal weights of silver and mercury thus change places. There must be enough free mercury present to form the liquid amalgam, from which the surplus mercury may be strained. If during the action a yellow deposit of mercurous nitrate forms, add a little nitric acid to the solution and stir with a rod of glass, or wood, to dissolve it.

After the silver has been all precipitated the solution should be put into another vessel, and the mercury recovered from it by suspending scrap copper in it. The copper will enter into solution and set the mercury free.

I notice a typographical error in the article. The sentence beginning at the bottom of the second column should read: "The worst form of discoloration of plates proceeds from the action of sulphates *of* iron and copper present in many ores from the natural decomposition of the pyrites."

N. S. KEITH.

San Francisco, Cal., July 3d, '99.

Electrolytic Copper.

A large amount of copper produced in the United States is now refined electrically, and is known as electrolytic copper. Some of the Western works turning out this product, especially where water power is obtainable, are very large. One of them at Great Falls, Montana, has nine dynamos of a total of about 2500 H. P., all driven by the Missouri river, which there rushes through a deep gorge. The copper is ground up and cast into pigs, and the pigs are then hung in large tanks filled with a solution consisting chiefly of copper sulphate. A heavy electric current at low pressure is passed through the series of tanks, decomposing the copper pigs, and the metal is electrolytically transferred by the solution to sheets of copper hanging in each tank, so that practically the sheets are copper plated. The metal obtained is very pure. The refuse, which falls to the bottom of the tanks, is rated at $2500 a ton, and it is said that the gold and silver obtained from it pays the cost of the electric process. —Electricity.

The Copper Output.

The Marquette *Mining Journal* says: "The production of copper in this country for May shows an actual decrease compared with that for the same period a year ago. The production from Jan. 1st to June 1st has increased 1380 tons over that of the same period a year ago. The figures are significant in view of the belief that production had been greatly stimulated by the high price. Thus far the increase in this country over last year is shown to be about 275 tons per month and it is now clearly evident that the 10% increase in the Lake product which has been maintained for several years will not be met the current year. The country's output of copper for May was 22,082 tons, against 19,954 tons in April. The increase is largely due to Anaconda output. It is claimed that the consumption of copper this year has increased 20%, while stocks of spot copper, both in this country and Europe, have been greatly depleted. In fact, all the leading copper mines are said to be sold ahead at least until September 1st. The supply of copper in London has become a serious question, as it would only fill the normal demand for a few weeks, and instead of the price now worrying the manufacturer, it is the question of keeping supplied, as copper is being used in enormous quantities to-day in America in telegraph and telephone circles, and in the event of any large and important extension of lines being undertaken the question as to where sufficient copper to meet the requirements could be obtained is said to be a serious one. Copper is shipped from the local smelters as fast as turned out and no supplies are kept on hand."

The copper situation at this time differs widely from that of 1887. The production of copper in the United States in 1887 was 81,017 tons; in 1888 it was 101,054 tons; in 1889, 101,239 tons. In 1898 the production of the United States was 235,790 tons; the net foreign imports (free of duty) were 14,114 tons. The home consumption in 1898 is estimated at 114,000 tons, and the exports of domestic copper were 134,387 tons, making a total of 248,381 tons, leaving on Dec. 31st an apparent stock on hand of that year's production and imports of only 309 tons, while the average rate of consumption was 2192 tons per week. The advance in the price was the natural sequence of the discovery that the demand was in excess of the supply. To what extent production will be stimulated by the higher price of copper is unknown. The output of the American mines increased from 81,017 tons in 1887 to 101,054 in 1888, but this gain was nearly all made from mines already opened and in operation. It takes a year or two to open any good mines, and it is believed in the trade that production cannot grow faster than consumption.

THE Coolgardie district, in Western Australia, has organized and incorporated a chamber of mines, the objects of which are stated to be as follows: To protect and promote the mining industries of the West Australian gold fields; to consider all questions connected with the mining industry, and to promote public discussion thereon; to promote and oppose legislative and other measures affecting the mining industry; to collect and circulate statistics and other information relating to the mining industry; to communicate with and exchange information upon mining matters with chambers of mines or Government departments of mines in Western Australia or elsewhere; to establish and maintain a library and museums of models, specimens, designs, drawings and other articles of interest in connection with the mining industry, or for the use of members; to act as arbitrators in the settlement of any dispute arising out of mining.

THE Massachusetts Institute of Technology receives, under the will of the late R. C. Billings of Boston, a bequest of $100,000, and an additional $50,000 to establish a fund to assist students who do not use liquor or tobacco.

The Iron Ores of the Urals.

The more progressive commercial policy of the Russian Government, which has for its object the opening up of the latent resources of the empire, has recently invited attention to her mineral wealth in directions which have not hitherto attracted very much notice. Among these may be mentioned the iron ore deposits of the Urals, which have hitherto, to a large extent, remained untouched, owing both to the inaccessibility of the regions in question and to the supremely backward state of metallurgical practice, as it has, until very recently, existed in the interior of the empire. In both these matters a considerable improvement has recently taken place.

One of the leading features of the new departure in Russian policy has been the extension of the Imperial railway system, and with the attention of the foreign mining engineer and the influx of foreign capital, a rapid advance is sure to take place in this particular section of Russian industry. The richness of the ores varies a good deal, from 45% to 50% on the western slopes to 60% and 65% in the interior districts.

In the middle Urals the ore deposits are in a higher state of development than elsewhere, and the district has, moreover, the additional advantage of having its mineral richness concentrated within a narrower area. It will easily be imagined that the appliances in use in the mines on the Ural mountains are not of the highest and most modern order. Some few of them are, indeed, fitted with fairly modern mechanical appliances, but the great majority are of a very primitive character, and horse and hand power remains the principle of operation. In times of agricultural depression the peasant takes an occasional turn at mining, a fact which is striking evidence both of his adaptability and of the rough modes of operation in use in the Russian mineral fields. Should the European capitalists take an interest in the development of this promising industrial territory it will not be long before a considerable and far-reaching change has been worked in the methods adopted there for winning the iron deposits which exist in such rich abundance.—London Mining Journal.

Mineral Resources of Mexico.

There are in Mexico 8644 mining properties, says *Modern Mexico*, divided among twenty classes, as follows: Gold, 828; gold and silver, 1675; gold and copper, 54; silver, 4024; silver and copper, 156; silver and lead, 1035; silver and iron, 42; silver and manganese, 2; copper, 501; copper and lead, 6; copper and iron, 49; lead, 19; lead and iron, 7; iron, 99; antimony, 19; tin, 8; mercury, 85; sulphur, 20; opal, 13; rock salt, 2.

These mines are divided among twenty-five States and Territories as follows:

STATES AND TERRITORIES.	Total number of mines.	Gold	Gold and silver	Gold and copper	Silver	Silver and copper	Silver and lead	Silver and iron	Silver and Manganese	Copper	Copper and lead	Copper and iron	Lead	Lead and iron	Iron	Antimony	Tin	Mercury	Sulphur	Opal	Rock salt

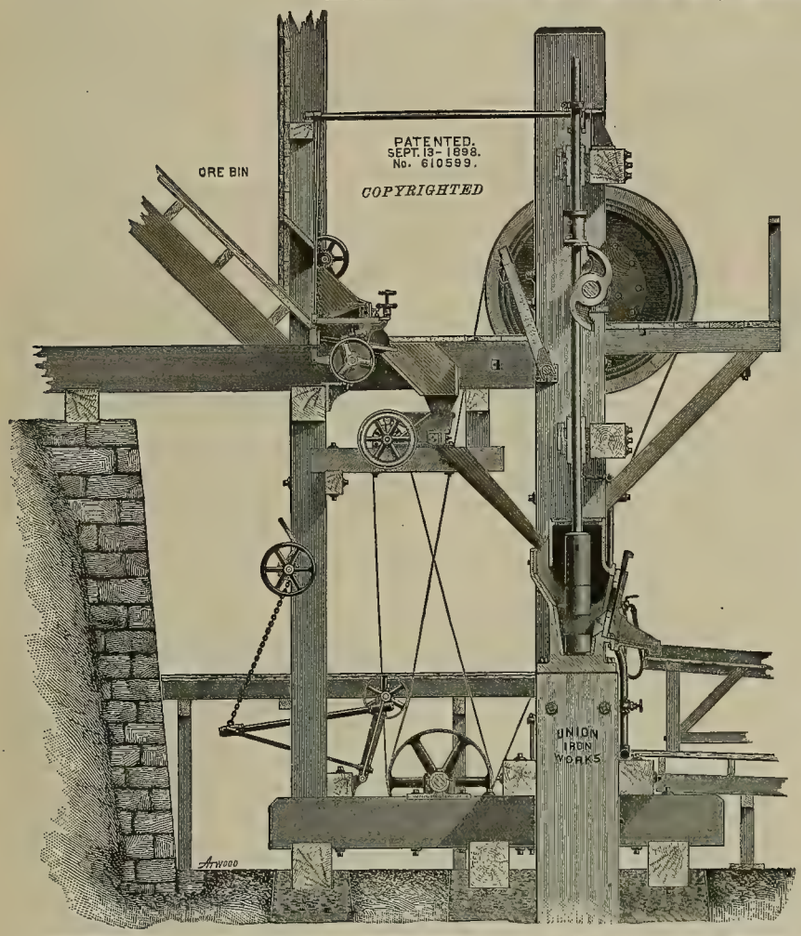
Oak Bark in Boilers.

Though oak bark does to a certain extent prevent scale, yet it requires to be used with very great caution indeed, or serious injury to the boiler may result. The tannic acid of the oak is very apt to settle in quiet places where the circulation is deficient and cause pitting. A case is recorded where oak bark was used and the boiler on being opened up a month afterwards was found in many places to be covered with patches of holes varying in diameter from ¼-inch to ⅝-inch. These holes were round, just as if they had been drilled with a drill, and were filled with strong corroding acid from the oak. Of course, the holes were thoroughly cleaned out and filled up with Archangel tar and cement. This shows the danger of oak bark as a scale-preventing medicine. A far safer and better remedy for scale is just common soda crystals. For every 100 gallons of water use ¼-pound of the soda. This is perfectly safe for the boiler, and prevents the scale from increasing to a dangerous thickness. A thin scale not more than about $\frac{1}{16}$-inch in thickness is beneficial to the boiler and assists in protecting it from its most dangerous enemies—rust and pitting. —Mechanical World.



End of the Golden Marine Co.

It is now stated in Boston that the discouraged stockholders in the Electrolytic Marine Salts Co., as the Rev. F. P. Jernegan's sea water gold concern was called, who sold out their holdings for 10 to 20 cents a share, now wish that they had not been so precipitate. The committee appointed to adjust affairs have discovered, so it is alleged, assets enough to pay one dividend of 20%, to declare another of 10%, and to hold out good expectations of another of 5%, to be paid early in the fall. The committee has also succeeded in selling the property at Lubec, Me., where the alleged secret process of transmuting sea water into gold went on, to a resident of the Hub who will convert it into a summer resort. This latter enterprise will undoubtedly prove more remunerative in the long run than the sea water gold scheme. This is a more happy ending to a gold-from-sea-water scheme than might have been anticipated.

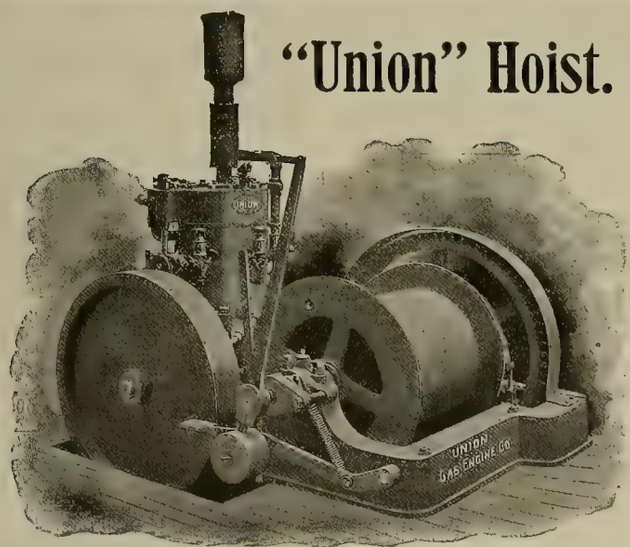
AN immense project has just been undertaken by the Lake Superior Power Company. Is is the developing of 60,000 H. P. at Sault Ste. Marie, Ont. Contracts for the power stream have recently been awarded to the Mason-Hoge Company of Chicago, Hubbell & Co. of Saginaw, Mich., and E. D. Smith & Co., of Philadelphia, Pa. The contracts already let aggregate $2,000,000. The power stream will be one mile and a quarter in length, 200 yards in width, and the water will be 19½ feet in depth. Already 500 men are employed in the undertaking. A manufacturing establishment covering an eighth of a mile of ground area will be erected at once.—Electricity.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.



We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

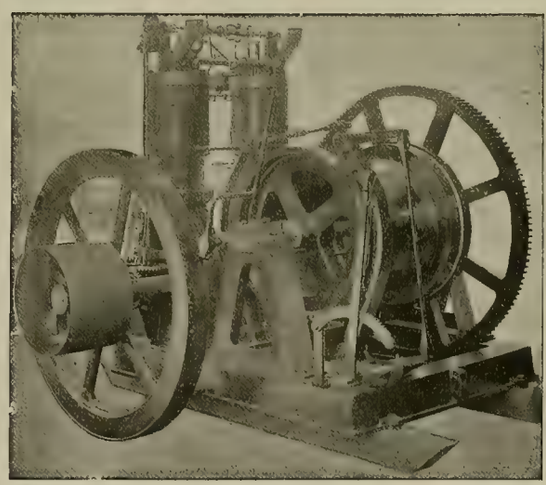
222 MARKET ST., SAN FRANCISCO, CAL.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—



"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

THE

Pelton Water Wheel Company

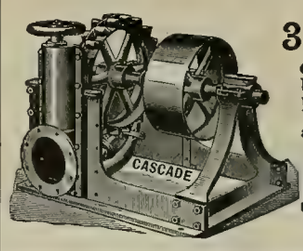
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.



The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.

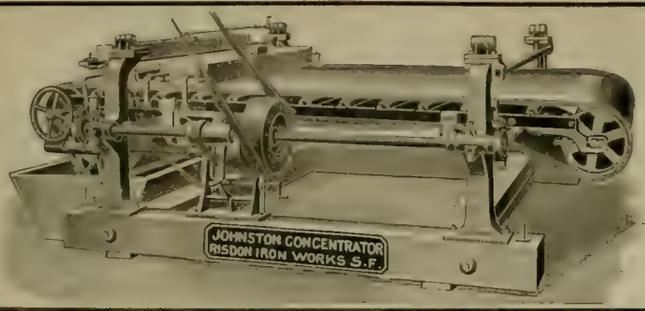
OAKLAND IRON WORKS,
330 Market Street,
Room No. 610. SAN FRANCISCO, CAL.



For Testing Placer Ground.

Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes.

Write for Catalogue and full information.

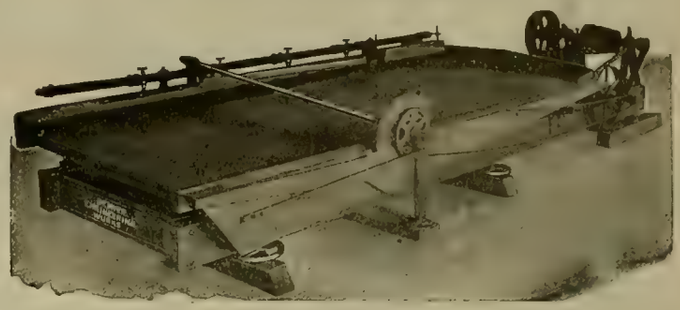
KEYSTONE DRILLER CO., Beaver Falls, Pa.

THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.



Send for Catalog No. 14. RISDON IRON WORKS, Howard and Beale Sts. San Francisco, Cal., U. S. A.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : :

Thoroughly Protected by Strong Patents. Write for Circular.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These Machines are Kept in Stock Ready for Immediate Shipment.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

P. & B. RED PAINT.

$1.00 per gallon in barrels, $1.10 per gallon in cans.

Like our P. & B. Roofings and P. & B. Building Papers, this is of first quality.

A little higher in price, perhaps, but the very best.

Market Reports.

SAN FRANCISCO, July 13, 1899.

SILVER.—London, 27 11-16d; New York, 60⅝; San Francisco, 60⅜; Mexican Dollars, 49¾ @50¼; New York exchange, sight, 12½; telegraphic, 15 cents premium.

The recent reports which indicate that the Chinese copper coins known as "cash" are disappearing because of their appreciating value and that silver coins are to fill the vacancy thus created in the currency of China lends special interest to a statement recently prepared by the Treasury Bureau of Statistics regarding the currency of China. The money of China, it says, is uncertain as to quantity and quality. No accurate estimate has been made of the amount of money in circulation in the Empire, while no accurate statement can be made to-day of what its value will be to-morrow. Based upon silver, its value fluctuates with the changes in the market price of silver. The copper cash, valued at about one-tenth of 1 cent, is the actual circulating medium; the "tael" is the nominal standard for larger sums, it being merely a given weight of silver, and a coin. Actual silver circulates in two forms, the "dollar" and the "sycee." The dollar was originally the Mexican dollar, and became a popular and generally accepted form of currency wherever obtained. So convenient was it that large quantities were imported for use as currency. More recently, however, mints for the coinage of dollars purporting to be of weight and fineness equal to Mexican dollars have been established, not by the central government, but by the authorities of the various provinces, and the result is that the rivalry between these provincial mints has reduced the weight and fineness of the dollars which they issue until the provincial silver dollars are looked upon with distrust. Additional mints, however, are being established, the machinery for them being from the United States. Some half dozen of the cities of China now have their mints for the coinage of dollars, and work is in progress upon local mints in other cities, so that by the end of the present year, it is found that at least ten different kinds of silver coins purporting to be dollars will be upon the market. In addition to this uncertainty may be pointed out the fact that the tael differs in various cities and provinces, the weight of silver recognized as a tael being greater at some points than at others. The consequence is that while the Haikwan, or customs, tael was worth, on January 1, 1899, 72.2 cents (gold), the Amoy tael was worth, but 71 cents, the Canton tael 70.8 cents, the Chinkiang tael 69.3 cents, the Ningpo tael 68.2 cents, the Chefoo tael 67.9 cents, the Hankow tael 66.4 cents, the Foochow tael 65.6 cents, and the Shanghai tael 64.8 cents. Even the sycee, which is an actual quantity of silver cast in the form of a shoe with the weight written upon it in Chinese characters, is somewhat uncertain as to its value, both by reason of the constant fluctuation in the price of the silver which it constains and the uncertainty as to the fineness of the silver utilized.

All efforts to learn the exact fineness of the standard silver used in the sycee have been unsuccessful, though the estimates put the rate at ninety-seven one-hundredths, which is considerably in excess of the American coin, which is ninety one-hundredths fine. The sycee is merely an indefinite quantity cast in the form of a woman's shoe, its actual weight being determined by agents or officers appointed by the merchants to weigh the sycees, accuracy and integrity on their part being insured by actual physical decapitation of those who are found dishonest. Even the cash, a copper and zinc coin about the size of our 25-cent piece, having a square hole in the center for convenience in stringing quantities of them together, varies greatly both in fineness and weight, in some cases 1000 of them being equal to a dollar, while in others nearly 2000 are required to equal a dollar. Gold coin is practically unknown in China, no coins of this metal being made at the mints, and gold coins of other countries have seldom, if ever, circulated, though the value of the metal is fully recognized, and gold, whether in coin or bulk, proves a medium of exchange upon determination of its weight and fineness when occasion requires.

The uncertainty as to the quality and quantity of the metals contained in the various coins and measures of weight makes an attempt to indicate the relative weight of the monetary units difficult and somewhat uncertain, though a recent official (consular) statement puts the relative values as follows:

10 cash.....=1 conderin.
10 conderin.=1 mace.
10 mace.....=1 tael.
1 tael.....=1½ ounces (avoirdupois) of silver.
(Value of Haikwan tael on Jan. 1, 1899, 72.2c.)

Mexican dollars and local dollars thus equal about three-fourths of one haikwan tael in value, though no official relationship exists save in the weight and fineness of metal in the dollars compared with the standard tael.

All customs duties are collected in what is known as the Haikwan tael, which has a somewhat higher value than the tael standard accepted in the respective cities.

The following table shows the value of the taels of the respective provinces where issued, April 1, 1899:

Amoy	70 2c
Canton	70.0c
Chefoo	67.2c
Chinkiang	68.6c
Fuchau	65.0c
Haikwan (customs)	71.4c
Hankow	65.7c
Niuchwang	65.9c
Ningpo	65 5c
Shanghai	64.1c
Swatow	64.9c
Takao	70.7c
Tientsin	68.0c

LEAD.—New York reports firmer, $4.55 bid, $4.60 asked; brokers' price, $4.35.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¼c; bar, 6.50c.

COPPER.—New York reports Lake unchanged at $18.25 bid, $18.50 asked; brokers' price, $18.50; mill copper plates, 23½c.

The report on the production of copper in 1898 has just been submitted to the United States Geological Survey by Special Agent Kirchoff. The production of the United States in that year was 526,375,591 pounds, which is by far the largest production ever reported. The increase in the production of copper was largest in Arizona, while the Lake district also recorded an advance. Montana fell off considerably.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—12½@13c per pound.

TIN.—Quiet, $27.87½ bid, $28.25 asked; pig, 31c per lb.; Bar, 35c. New York weak, $23.35 bid, $25.50 asked.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $43.50; export, $39.50@40; carload lots, special rates.

PLATINUM.—London, 63⅛s per ounce; York, $16.25; San Francisco, $16.75.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

CANDLES.—Electric Light Candles—6s, 16 oz., 8½c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5½c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7½c; 6s, 10 oz., 6¾c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

CHEMICALS.—Cyanide of potassium, jobbing, 32@33c per lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 4½ @5c per lb.; borax, refined, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2¾@2½c; California refined, 1¾@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₰ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 14c; chlorate of potash, 25c; caustic potash, 12c.

OILS.—California Castor, pure, cs., $1.08 per gal.; bbl., $1.03; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.15; less than 200 gals., $1.10; in bbls., 4c per gal. less than case; Baker's Crystal, $1.40; China Nut, 50c; Linseed, strictly pure, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 47c; cs., 52c; raw, bbl., 45c; cs., 52c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 16½c; Astral, 16½c; Star, 16½c; Eocene, 18½c; Extra Star, 20½c; Elaine, 21½c; Water White, bulk, in tanks, 11½c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21c; 86 deg. Gasoline, bulk, 21c; do., cs., 26c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 20½c; Lard Oil, Extra Winter Strained, bbl., 52c; cs., 57c; No. 1 bbl., 46c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 70c; No. 1 bbl., 50c; cs., 52½c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

NAILS.—List per keg: No. 20 to 60d, wire $3.10; cut, $3.00; 10 to 20d, wire, $3.15; cut, $3.05; 8d, wire, $3.20; cut, $3.10; 6 and 7d, wire, $3.30; cut, $3.20; 4 and 5d, wire, $3.40; cut, $3.30; 3d, wire, $3.55; cut, $3.45; 2d, wire, $3.80; cut, $3.60. In carload lots, 10c per keg less.

CORDAGE.—

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 1st day of July, 1899, and the day of sale from the 8th day of July, 1899, to SATURDAY, the 22nd day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to TUESDAY, the 1st day of August, 1899, and the day of sale from the 22nd day of July, 1899, to SATURDAY, the 19th day of August, 1899, at the hour of 2:30 P. M.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, Cal.

ROSE CREEK MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Office—163 Crocker building, San Francisco, Cal.

BOULDER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of May, 1899, an assessment (No. 3) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of July, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 27th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California

WANTED.—BY A GRADUATE OF CASE School of Applied Science of Cleveland, O., a position as assistant mining engineer, assayer, or chemist. Best of references furnished. Address FRANK B. MARBLE, Bedford, Ohio.

WANTED, SITUATION

AS SALESMAN AND BOOKKEEPER IN MINING CAMP. Competent to take charge of store. Address S. E., this paper.

POSITION WANTED by an experienced cyanide man, assayer and chemist, preferably in charge of a cyanide mill. Speaks Spanish. Technical graduate. Can furnish a good assay outfit if desired. Address W. J. P., care of this paper.

Mining Superintendent, Assayer and Millman

of twenty years' experience wishes position. Eight years at last place. Best of reference. Address A. J., care Mining and Scientific Press.

MINING ENGINEER,

with eighteen years' practical experience in all branches of mining work, wants position as superintendent, assayer, surveyor or bookkeeper. Address "Cupel," care Mining and Scientific Press.

WANTED.

Second-Hand Oerteling Assay Balance No. 12, Also Good Pulp Balance.

Address STATE ASSAY OFFICE, 431 California Street, San Francisco, Cal.

WANTED—Second-Hand Huntington Mills,

3½ Ft. or 5 Ft. Must be in good condition. Send age and lowest cash price f. o. b. nearest railroad point, to L. Z., this office.

Mining Properties,

GOLD AND COPPER.

J. N. ROSA, BOX 5,.....SHASTA, CAL.

MACHINERY — FOR SALE OR LEASE, all or half interest in the Cripple Creek Machine Shops and Foundry. This is the largest and best equipped plant in the district; or will trade for good mining property or stocks in the Cripple Creek district. Party must be practical and competent to take charge of and manage the business, as owner is giving his attention to mining. Address the Cripple Creek Machine Shops, Cripple Creek, Colorado.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.

For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

WANTED.

20-STAMP GOLD MILL,

Complete with Power, Feeders, Plates and Concentrators.

Must be nearly new and in first-class condition. Give full particulars and price f. o. b. cars or steamer, or as it stands. Address "ALASKA," care of Mining and Scientific Press.

..CRIPPLE : CREEK..

FOR SALE—CYANIDE PLANT,

100 tons daily capacity; in first-class condition to handle Cripple Creek ores.

Plant in full running order, with all latest improvements. Address JOHN S. MacBETH, Equitable Building, Denver, Colorado.

DELINQUENT SALE NOTICE.

SILVER KING MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice.—There is delinquent upon the following described stock, on account of assessment (No. 21) levied on the 1st day of June, 1899, the amount set opposite the name of the shareholder, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Frances A. Sackett (N.Y. issue).	41	100	$25 00

And in accordance with law, and an order from the Board of Directors, made on the 1st day of June, 1899, so many shares of said parcel of stock as may be necessary will be sold at public auction at the office of the company, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California, on TUESDAY, the 8th day of August, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. PEW, Secretary.

Office—No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

DELINQUENT SALE NOTICE

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 7) levied on the 7th day of June, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
C. Rehn	77	1,000	$50 00
C. Rehn	161	150	7 50
A. Rehn	176	250	12 50
G. F. Volz	85	1,000	50 00
W. G. Loewe	122	500	25 00
F. B Schuster	139	500	25 00
F. Woenne	154	1,000	50 00
W. F. Hatch	219	100	5 00

And in accordance with law, and an order from the Board of Directors, made on the 7th day of June, 1899, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 773 Mission St., San Francisco, California, on TUESDAY, the 1st day of August, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California. Office hours from 1 to 3 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received an application from H. W. Tangerman to mine by the hydraulic process in the Clinton Placer Mine, at Clinton, Amador Co., and to deposit tailings in Jackson Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on July 31, 1899, at 1:30 P. M.

WEST COAST OF MEXICO.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

For any information regarding Frue Vanner or Belts, call on or address

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.
(Successor to Adams & Carter.) 132 MARKET STREET, ROOM 15, SAN FRANCISCO.

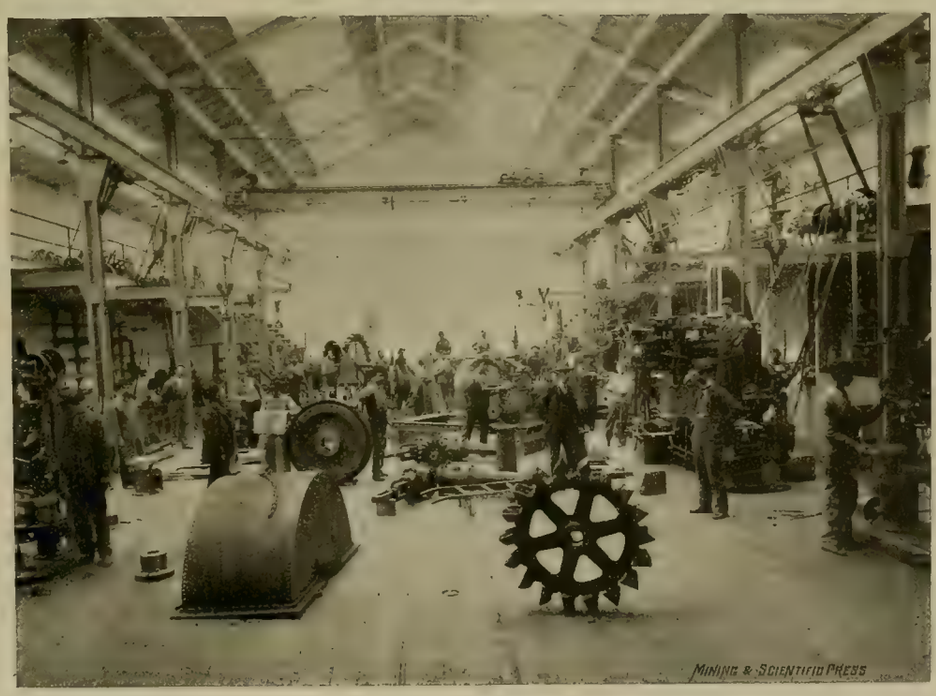
No. 2038.—VOLUME LXXIX. Number 5. SAN FRANCISCO, SATURDAY, JULY 29, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Need of Enterprise.

The mines of Colorado are uniformly at a high altitude, few of them being found lower than 7000 feet above the sea and many of them are at an altitude of 12,000 feet and more. In Idaho, Utah and Montana also a large number of the best mines are at high altitudes, and in addition to the drawbacks of high altitude are the rigorous winters of higher latitude; but in each of these States mining is progressive and prosperous. In many of the mines in the States mentioned the ores are not altogether free milling but require crushing and concentration to make their values available, though quantities of ore are rich enough to be shipped without treatment at the mines. The success of these mining regions is wholly due to the spirit of enterprise which characterizes the development of the natural resources of those States and to the activity of the various railroads in competition for mining business which has been so largely profitable to them. In these States no sooner is the value of a newly discovered district demonstrated than railways are built as rapidly as possible to the field and they assist greatly in the development and extension of the producing mining region. In California, for several hundred miles along the high ranges near the crest of the Sierra Nevadas, at an altitude of 7000 to 12,000 feet, runs a great mineral belt which is almost unknown and absolutely undeveloped. The ores are of higher grade than the average of those being successfully worked in the lower hills farther west and the veins much larger generally, but nothing is done with them. The ores are not free milling but are susceptible to treatment by known processes. They are not uncommon ores, consisting generally of the sulphides of iron, zinc, lead and copper, and contain gold and silver. As a class they may be called concentrating ores. If competing railroads were built into these regions undoubtedly many good mines would be opened and become profitable enterprises, and the output of mineral in California would be increased and an industry become established in a new field that would last many years. The snowfall is heavy in these high altitudes, but the drawbacks due to climatic conditions are not nearly as serious as those in many parts of Colorado. The summer season is longer than in Colorado's high mountains and most of the mines of the California Sierras are within or near a magnificent forest of timber and in many places water power is available, and where this is not the case electrical transmission of power is practicable and usually it would be unnecessary to construct long lines. Water for metallurgical purposes may be obtained almost anywhere in this region, where large and permanent springs abound.



50 H. P. GASOLINE ENGINE FOR A NEVADA MINE.

Gasoline Engines for Mines.

Gasoline engines for hoisting in mines, especially in districts where fuel for steam engines is scarce, are being used more freely each year as mine owners gain confidence in their reliability and find by the experience of others that they are reliable and economical. Herewith is illustrated a hoisting engine recently built by the Hercules Gas Engine Works of San Francisco for the Young America G. M. Co., Tuscarora, Nev., designed to handle a load of 2500 pounds at a speed of 400 feet per minute, the capacity of the engine being 50 H. P. under a brake test. The hoisting drum is 14 inches between flanges, 42 inches diameter; the main gear is 7 feet diameter, 8-inch face; post brakes are intended to afford control of the load at any point; provision has been made for adjustment both of brakes and drum friction. The hoist, as shown in illustration, weighs 14,500 pounds. Gasoline engines for use about mines, where placed in proper hands, have usually given satisfaction and effected a saving in fuel.

New Building of the Pelton Water Wheel Co.

The Pelton Water Wheel Co. have recently erected a four-story brick building on Main St., between Mission and Howard Sts., San Francisco, Cal. The structure is particularly designed for manufacturing purposes and offers unusual facilities for such work. It is equipped with many modern appliances, such as elevators and traveling cranes, pneumatic and electric devices for handling material, etc. The shop portion covers 20,000 square feet of floor space; the entire roof is of glass, affording excellent light. The various mechanical departments are operated by separate electric motors. The general design and arrangement of the building embrace the combined features of modern Eastern machine shops, and for its capacity it has been pronounced by critical visitors to be equal to any structure devoted to mechanical purposes on the Pacific coast. An interior view of the building and machine shop is shown herewith. Besides manufacturing water wheels and other hydraulic apparatus, the company have taken up a general line of high-class work, for which it is well equipped.

INTERIOR VIEW OF THE PELTON WATER WHEEL CO.'S NEW BUILDING.

Patents for Pacific Coast Inventors; Notices of Recent Patents; Recent California Dividends; Recent Mining Incorporations; Commercial Paragraphs; Obituary, 126.

THE divining-rod miner has again put in an appearance in the field—this time in Colorado, with an instrument which infallibly locates the position, size and value of ore bodies. One of the strangest things in connection with divining-rod men is that they are usually financially embarrassed to a surprising extent, considering the facility with which they can locate bonanzas for other people—for a consideration. Although this class of fraud has long been practiced, and there are many who are readily duped by the shrewdness of these wizards of the "hoodoo stick," the first instance where one of these impostors ever really found anything not already exposed by the hard work and capital of some one else has yet to be recorded.

ANOTHER important decision in a "grubstake" case has been rendered in the Idaho courts. Judge E. C. Steele has decided that J. N. Rice and P. Mallory are entitled to a one-half interest in the Big Buffalo mine on Buffalo Hump. Rice furnished the grubstake to B. R. Rigley and C. F. Robbins, who located the claim, going to it by directions given by Mallory, who had previously discovered it. It was understood and agreed between these four parties that defendants should locate the ground in the equal interest of all, but Rigley and Robbins staked the claim in their own names, neglecting to put those of Rice and Mallory on the stakes, and afterward refusing to do so, whereupon plaintiffs brought suit. This is the property recently reported sold to J. R. De Lamar for half a million dollars.

SOME of the mine managers of the Transvaal are having difficulty in securing enough native laborers to keep the mills running to their full capacity. The natives work for a specified time under contract and all those whose time has expired are leaving for their northern homes as fast as released. Desertions are also of frequent occurrence. It is said that not only do an insufficient number of new men leave their homes to take the places of those whose terms of contract have expired, but many who would otherwise come are turned back by those leaving the mines. The reason for this is stated to be the unsettled condition of political affairs in the Transvaal and the likelihood of war. So serious has the situation become that a number of mills have been obliged to hang up a portion of their stamps, being unable to supply them with ore to their full capacity. It is anticipated that if this continues it will materially affect the output of gold. It is also stated that there are an unusual number of white skilled miners leaving the Rand, though no particular cause is assigned for it.

Where Mistakes Are Costly.

In Colorado, California, Utah and other States considerable present attention is given to the development of water power, the supplying of irrigation facilities, and, in general, the proper application of a great natural force hitherto not utilized to its fullest extent in this part of the United States west of the 100th meridian. In view of the necessary expenditure of time and money, and the expectations that should be approximately realized in the various projects now contemplated, it is in order to suggest the necessity of preliminary care and investigation, the employment of competent engineers, and, in general, "making haste slowly," at the start.

The need for such exhaustive preliminary work, the absolute necessity for patient investigation, and the economic value of proper engineering inquiry has been repeatedly shown. Better spend $1000 more in tentative work than lose $100,000 later in the history of the project.

It is in order to cite a case wherein the possession of some scientific information, the continued employment of competent engineers, and the exercise of wise economy (which simply means judicious expenditure of money) would have made a fair success of what it is feared will be a failure.

In 1890 the city of Austin, Texas, decided to dam the Colorado river, which drains an area of nearly 40,000 square miles above that point, the idea being to create a big power supply. About $1,500,000 was appropriated, and a dam 1150 feet long and 68 feet high was built. Those in charge assumed that the Colorado river there had a minimum flow of 1000 second-feet; they also assumed that sufficient precaution had been taken to guard against the deposition of silt in the bed of the artificial lake 800 feet wide and backing up the river twenty miles, that they were creating.

An illustrated description of the work appeared in the issue of September 15th, '94.

Expected results not ensuing, recent measurements conducted on a scientific basis show that the original estimate of the river's flow was greatly in excess of the fact, and further investigation shows that while the original volume of water in the lake was 2,330,000,000 cubic feet, there is now but 1,367,000,000 cubic feet of water possible within its limits, there being 33 feet of silt in the bed of the lake, taking up 963,000,000 cubic feet, and from local reports it appears that no feasible plan can now be devised to prevent the final uselessness of the whole thing by reason of insufficient water supply and the ultimate filling up of the bed of the lake with silt.

In this regard it is in order to notice the good work being done by the U. S. Geological Survey. Government engineers are compiling exact data throughout this entire region, the proper use of which is directly calculated to obviate such an unfortunate waste of capital and effort as that noted in the Austin case, which is cited not for invidious comment, but as a notable example of how well-meant projects deserving of success and honestly conducted with the best intent sometimes fail in their mission because of insufficient attention to preliminary engineering details and scientific requirements.

REALIZING the importance of the petroleum industry on the Pacific coast, the MINING AND SCIENTIFIC PRESS has arranged for a series of articles on the subject by W. L. Watts, the man who knows most about its occurrence in California, having been continuously engaged for several years past in an exhaustive study of its details, under the auspices of the California State Mining Bureau. The first paper will deal with the structural geology pertaining to deposits of petroleum in California; the structural features which control the direction and extent of oil lines and regions wherein there has been much geological disturbance; the factors which enter into oil prospecting propositions of sufficient merit to be classed among commercial enterprises; the business risks which such enterprises involve proportional to the character of geological evidence in sight—which may give those unfamiliar with oil business some idea of the relative merits of oil prospecting propositions; importance of petroleum interests; phases of geological investigation upon which an understanding of the petroleum deposits depends; character of folds which affect the course of oil lines; types of folds; depth to which rocks are affected by folds; relation of oil lines to folds, oil lines occasioned by faults, cross folds, complex geological structure demanding careful study, oil lines traced from mountains to valleys; business risks in oil prospecting classified—orthodox and wildcat prospecting propositions; conditions under which petroleum is found in California; method of determining strike and dip of oil-bearing strata; the element of risk diminished by careful and competent preliminary geological work. The paper is comprehensive in its scope and will constitute a valuable contribution to general and technical knowledge on this subject. It briefly anticipates the publication of a bulletin by State Mineralogist Cooper, now being prepared by Mr. Watts.

THE Executive Committee of the California State Miners' Association, at a meeting in San Francisco on the 25th inst., decided to give its moral and financial support to the defendants in the suits recently brought by the California Anti-Debris Association in Sutter, Yuba and Sacramento counties against hydraulic miners working under permits from the California Debris Commission. A motion to that effect was adopted without opposition and a sub-committee appointed "with power to act." The whole question is so thoroughly understood as to render any discussion unnecessary. The matter was taken out of the local courts six years ago; an act of the Federal Congress gave U. S. engineers sole jurisdiction. If a county judge in an agricultural community can override and subvert Federal law, and if a county in California has jurisdiction in this matter superior to that of the United States, it might be worth while knowing it.

WHY is it that men who are out in large numbers scouring the mining regions in search of property showing sufficient value to warrant investment, ask for large, low-grade mines, it is difficult to understand. One would naturally suppose they would prefer a large, high-grade mine; but inquiry is never made for a mine of this description. It is always a large, low-grade mine that is wanted. It surely cannot be because there are no large high-grade mines, for such things have been known repeatedly. Presumably it is considered easier to find a large low-grade mine than a large high-grade mine. The average prospector, however, seems usually cheerfully willing to supply whichever element may be lacking, but the fact that his statements are not always borne out by the actual conditions has been the source of much sorrow to the itinerant expert.

A HIGH GRADE of ore does not necessarily signify large profits any more than a low grade of ore may indicate failure. The environment of the mine, the size of the vein or ore body, the facility with which it may be attacked and the character of the ore all have a direct bearing on the economics of the proposition. Next in importance is the accessibility of the property, means and cost of transportation, cost of water, fuel, wages, etc. No item of importance can be disregarded when passing judgment on the prospective value of a mining proposition. When all these factors have been arbitrarily determined by actual operation the proposition is simplified, but the engineer in a new and untried field has a great responsibility resting upon him when he undertakes to determine these important questions, and experience elsewhere is the only way in which he can do it.

MANAGERS of copper mines throughout America report that their product is absorbed as rapidly as it can be produced and that, indeed, a still larger production would be taken. London buyers have been withholding their orders, evidently believing that the copper market was being bolstered by the Amalgamated Copper Company, but finding that there is no surplus being created, have commenced to place orders for future delivery, which may result in sending the price up a notch or two. Tin is much higher than copper, though in the United States 12,000 tons of copper is consumed monthly as against 3000 tons of tin, which demonstrates that tin is scarcer.

Concentrates.

ASSESSMENT NOTICES, etc., can receive legal publication herein.

IDAHO is estimated to have increased its population 25,000 in the last year.

SIX CENTS per share is the present New York price of Comstock Tunnel Co.'s stock.

WHENEVER possible avoid litigation in mining—compromise the case if you can.

A DIPPING NEEDLE has been frequently used successfully in locating magnetic iron ore deposits.

GOV. STEUNENBERG sends word that he wants "three experienced pump men" at Burke, Idaho.

THE ore sent from Paradox, Colo., does not contain vanadium or uranium. It is carbonate of iron.

THE employment of an iron tamping bar has caused the death of another miner in Shasta Co., Cal.

AN adit is a tunnel driven from the surface to the ore bodies of a mine either on the vein or across the formation.

IT is not always the largest mine that realizes the greatest profits, nor the richest ore that gives long life to a mine.

THE total amount of copper produced in the United States in '98 was 526,375,591 pounds, valued at $61,849,132.

THE *Arizona Republican*, published at Phœnix, has, doubtless, the largest circulation of any paper published in that Territory.

IN sampling ore it is very essential that the prospector or miner does not deceive himself, though he not infrequently does so.

ANHYDRITE is an anhydrous calcium sulphate, and is harder than gypsum. A large deposit of this mineral occurs in western Nevada.

"PEGAMOID" is a metal paint used by electrical companies to preserve their wires. It gives a silvery appearance, and is non-corrosive.

THE "big" successes in mining are not, were not and will not be made by paying "big" prices for "big" mines, but by developing prospects.

SULPHUR in a free state is usually found about the vents of active volcanos. Often it is associated with selenite and other forms of calcium sulphate.

THE N. Y. average price of lead in '98 was 3.78 cts. per lb., of tin 15.7 cts., of copper 12.03 cts. Present quotations will be found on page 138 of this issue.

PRACTICAL experience favors the superior economic value of freshly cut zinc shavings in cyanide precipitation as compared with other proffered devices.

DR. BARTLETT, American Zinc Lead Works, Canyon City, Colo., could doubtless answer the question asked by C. T. S., Leadville, Colo., regarding reduction of zinc ore.

MILLMEN should give careful attention to details. Do not accept as a fact that the best possible work is being done until the value of the tailings absolutely demonstrates this to be the case.

THE recent reduction in mint and refinery charges noted herein applies only to gold bullion 700 fine and over. No Government modification has yet been announced in the charge for refining silver.

THE present stock of gold in the United States is stated to exceed that in any country in the world, being estimated at $975,454,000, which is 50.05% of all our circulation and $12.81 per capita of population.

IT is said that the flow of water in Lytle creek, a stream flowing south from the San Gabriel range a few miles west of San Bernardino, Cal., has increased 175 inches since the recent earthquake in that vicinity.

THE purest carbonate of lime makes the best commercial lime when properly burned. Calcareous travertine is often employed for this purpose where massive limestone is not obtainable, and it usually makes a superior article of lime.

CALCIUM has never been observed in nature unaccompanied with other substances. It has been isolated artificially, and is a light, yellow metal, between gold and lead in hardness. It occurs chiefly as a carbonate or sulphate of lime.

WATER cannot be held back in mines by cementing the walls. When stopped at one point it finds its way into the workings at some other. Continued pumping is the only way in which a mine below the drainage level may be relieved of water.

"THE fastest Transatlantic steamship run to date" is the trip ending the 15th inst. of the Kaiser Wilhelm, Sandy Hook lightship to Cherbourg, France—5 days, 20 hours, 55 minutes—3190 miles, an average of 22.65 knots, or 26 miles, per hour.

PLACER mines operated on a large scale by hydraulicing or ground sluicing do not clean up frequently, as it involves a large and unnecessary expense. Where sluicing is carried on by shovelling into boxes it is customary to clean up at least once a day.

ASSESSMENT work must be done annually on all unpatented mining claims, and the work must be done each year. Though the amount of work done in any one year reaches the value of many thousands of dollars, it will count as nothing for the succeeding years.

TO DATE operations of the Risdon hydraulic system in the C. & C. shaft, Virginia City, Nev., confirm the expressed opinion that the unwatering would affect the entire lode. So far the water in the Belcher shaft, two miles from the C. & C., has been lowered 22 feet.

COPPER coins are now being imported from India to the United States as "copper scrap" for remelting and commercial use, being worth more as bar copper than in the shape of coins. It is asserted that Chinese copper coin is susceptible of similar profit in the same way.

IF mine owners, who are new in the business, would take more care in testing their ores or having them tested, and determining from these tests the proper kind of machinery to employ in the treatment of their ores on a commercial basis, fewer failures would result.

THE depth to which oxidation takes place in a vein is determined by various conditions. Drainage probably has a direct effect upon this, and atmospheric conditions may also be of importance. That the character of the wall rocks has an influence on the depth to which oxidation extends is improbable.

THE Bonanza pocket mine, at Sonora, Tuolumne Co., Cal., is credited with a production exceeding $3,000,000. A single pocket contained more than $500,000, and one mass weighed $40,000. Most of the gold was taken out with the use of hand mortars. The gold was usually found associated with tellurides, generally petzite.

THE miners' inch equals .02499 cubic feet per second, 1.4994 cubic feet per minute, 89.964 cubic feet per hour, 2159.146 cubic feet per day of twenty-four hours. Under ordinary conditions a 5-stamp battery uses a miner's inch of water. A tank 30 feet long, 11 feet wide and 10 feet high will hold a little over this amount if full.

AT the south end of Kawsoh mountains near Carson river, in Nevada, occurs a rock containing augite, feldspars mostly sanidines, and nepheline, which greatly resembles phonolite. A similar rock occurs on some rounded hills at the north end of the range. On the eastern side of these hills is found a similar rock but much lighter.

SINCE the Forest Hill Divide ancient channel system in Placer county, Cal., was formed, and covered with the flow of andesite from the Sierras, the forks of the American river have cut down through the lava cap and into the underlying bedrock nearly 3000 feet, and still the formation of the gravel channels are considered a recent geological event.

THE Iquique, Chile, subscriber whose subscription was paid up to 1903, was till the 22nd inst. the longest-in-advance-paid-up of any on the list. He is now exceeded by a South African mine manager, who pays to Jan. 1, 1906, and a Dawson, Yukon, miner who pays to July 1, 1904, and says: "Before that time I shall be importing quartz mining machinery."

THE occurrence of pyrrhotite in mines frequently renders it impossible to employ the magnetic needle underground. Owing to the many objects which affect the magnetic needle, such as magnetic ores, track rails, air pipes, tools, cars, etc., it is never safe to depend upon a needle underground. Such surveying must be done by the use of the vernier.

FLUORITE is a calcium fluoride, and is also called tiff by Cornish miners. It occurs associated with lead and zinc ores in England. It is abundant at Castle Dome, Ariz., in Yuma county, and is prominently associated with the telluride ores of Cripple Creek, Colo. The purple-colored rock found in the mines of Creede, Colo., is chiefly amethyst, a variety of quartz.

IF a wall plate is broken by the flying rocks from a blast it can often be sufficiently reinforced by placing a second plate immediately underneath it, driving in short posts at the corners and setting in angle braces reaching from the new plate diagonally to the wall plate in the set below and on the opposite side of the shaft. This will render the entire set rigid and stronger than before.

THERE is little or no sign of glaciation in the lower lands of California—that is, in the foothills of the Sierras—but in the high lands are found large and living glaciers. The most important glaciers are those on Mount Lyell, Mount Dana, Mount Shasta and Mount Ranier. There are other but smaller glaciers on other peaks of the Sierra Nevada. Yosemite valley is of glacial origin.

A FAULT which dislocates the vein was exposed in the Gover mine in Amador county, Cal., several years ago on the 1000-foot level. The displacement was about 50 feet, the north end being thrown to the eastward that distance. The fault was nearly at a right angle to the strike of the lode and vertical. It occurred at a place where the formation had previously been subjected to torsion.

DEATH VALLEY is in Inyo county and Salton basin is in Riverside county, Cal. Both are below the level of the sea. The floors of each are occupied by salt marsh, and the thermometer frequently rises above 125° F. in the shade. At Salton men live all year round and collect the salt. The air is absolutely dry. In a humid atmosphere few human beings could endure such a temperature.

THE Formation springs in the Yellowstone National Park in Wyoming are depositing large quantities of calcium carbonate from the calcareous waters. The deposits cover acres, and are among the most interesting of the natural objects of the park. It is probable that the various deposits of aragonite, called onyx, found in Arizona, Mexico, California and elsewhere, are formed in this manner.

AT Butte City, Mont., the copper-bearing waters pumped from the mines are run through long wooden boxes in which have been placed iron scraps. The copper is precipitated on the iron in the form known as cement copper, which runs 70% to 80% copper, and even lower. The length of the boxes is determined by the percentage of copper in the waste water. If it has not all been precipitated more boxes are added.

THE first long-distance pumping plant to be established at a mine in California was from the Colorado river to the Paymaster mine, east of Glamis station, in San Diego county. The distance is about seventeen miles. Since then two lines have been put in from the river to Cargo Muchacho and two lines to Hedges, distances of twelve to fourteen miles, and raising water 500 feet. Each proved a success.

IN locating a mining claim, first make a discovery, then define the boundaries of the claim by setting a stake or building a monument of rocks at each corner and at the center of each end of the claim. Post a notice at the discovery, stating when discovered, by whom, the amount of ground claimed along the lode in either direction from the stake. The development of the claim may then be proceeded with, but not necessarily at the point of discovery.

A BARRIER REEF is a deposit formed across the mouth of a river or stream flowing into the ocean or a large lake, by the pounding back of the detritus carried down by the stream by the waves. The material constituting a reef of this character is usually made up of cobbles and gravel. A spit is a bar of sand carried out from the mainland into the deep water of ocean or lake by coastwise currents and results in the formation of a bay or lagoon.

LOST mines are illusive; better search for a mine that has never been lost. The Grapevine mine in San Bernardino county, Cal., was discovered by a German prospector named Lee, who thought it was a cinnabar deposit owing to the color of the rock, which is heavily charged with red iron oxide (hematite). Porter & Waterman relocated the vein and developed a rich silver mine. Calico was discovered shortly afterward by prospectors who were searching in the hills near the Grapevine district.

IF your ground is soft and a large amount of grit is taken up and discharged by the pump it may be remedied somewhat by putting a wire netting around the suction in which the holes may be too large. Protect the suction hose by wrapping ¾-inch Manilla rope around it, and then secure it by ropes in such a manner that it will not touch the walls, as the swaying motion given it by the pulsations of the pump will quickly wear a hole through the rubber if the hose comes in contact with the rock or timbers.

IN the Colorado case of the Mayflower G. M. Co., on application made by the company for patents for the Beaver Springs placer No. 1, Beaver Springs placer No. 2 and the Mayflower and the Highland Chief lode claims of the Pueblo district, the Secretary of the Interior holds that both placer and lode claims may be included in one application. It was once held that a patent could not issue for both lode and placer claims where the lode was not within the exterior limits of the placer location, but the Secretary of the Interior now rules differently.

WHEN an abandoned claim is to be relocated a new discovery must be made and a new shaft or new tunnel started, as the work formerly done cannot be counted as a part of the assessment work. It is as important to define the boundaries the same as though no location had ever been made upon the land. It is not necessary that the new location should conform to the lines of the previous location, as, if desired, only part of the old location may be included in the new. It is always well to state what portion of the new claim covers an abandoned location.

IN constructing dams it should be remembered that if an absolute barrier be built across the stream, and no gate provided at its base, the reservoir in time will become filled with sand and silt and its usefulness ended. This may be obviated by the construction of a gate in the dam at the lowest part of the channel, through which the reservoir may be emptied periodically at a time when it will not interfere seriously with the purposes for which the dam was built. The deposits of detritus take place at the upper end of the reservoir and should not be allowed to accumulate in too large an amount.

THE ores which contain tungstic acid are wolframite, a tungstate of iron and manganese. It is a heavy, hard, dark-grayish or brownish-black mineral, with submetallic luster. It is sometimes weakly magnetic. Hubnerite is near wolframite, but contains 20% to 25% manganese oxide. Scheelite is a calcium tungstate, having a hardness from 4.5 to 5. It is white, yellowish white, pale yellow, brownish, greenish or reddish; streak white. It is found associated with cassiterite, topaz, fluorite, molybdenite or wolframite, in quartz. Tungstite is tungsten trioxide; is pulverulent, earthy; color, yellow or yellowish green.

AMONG copper deposits one of the most remarkable in America is that at Copper Basin, eleven miles southwest of Prescott, Ariz. This deposit consists of a bed of detritus—the result of the degradation of the neighboring hills of granite and eruptive rock, which is cemented by carbonate of copper (malachite), presumably derived from the numerous small veins occurring in the underlying crystalline rocks, the waters flowing from which carry copper sulphate in solution which has been precipitated in the interstitial spaces of the debris. The waters flowing in the neighboring creeks contain copper in solution, and when at a low stage deposit films of copper carbonate on the bedrock over which they pass.

FOR many years scientists have claimed that a series of earthquakes was always followed by the active eruption of one or more volcanoes. Whether or not there is any significance in this cannot positively be known, but it is usually the case. Earthquakes have been of frequent occurrence of late, in various parts of the world, and volcanoes are active which have been dormant for years. Mount Ætna, on the island of Sicily, and Mauna Loa, in the Hawaiian Islands, are both active, the latter pouring forth a great volume of molten lava, which is flowing down the slopes of the mountain to the sea. Whether these volcanoes are safety valves which, when active, relieve the pent-up internal forces of the earth remains to be seen.

THE succession of massive eruptions during the Tertiary and post-Tertiary ages in widely separated parts of the earth has been determined by Von Richthofen to have occurred as follows: Propylite (altered hornblende andesite), andesite with dacite (quartz-bearing andesite), trachyte, rhyolite, basalt. All the volcanic eruptions of recent times are of basalt or of finely comminuted material of the basaltic magma. The succession of rocks in Washoe district, Nevada, has been determined by Geo. F. Becker, of the United States Geological Survey, to have been: Granite, metamorphics, granular diorites, porphyritic diorites, metamorphic diorites, quartz porphyry, earlier diabase, later diabase, earlier hornblende andesite, augite andesite, later hornblende andesite, basalt.

WHERE rocks contain a considerable amount of iron sulphide which is undergoing the process of oxidation, water flowing through such rocks takes up the resultant ferrous sulphate in solution. Where it issues in the form of springs or in underground workings, its presence is detected by the astringent (alum-like) taste of the water, and by a yellowish-brown precipitate on the sides and bottom of the channel or upon adjacent rocks. Such water is known as chalybeate. When it comes in contact with other waters containing carbonates in solution, the sulphate is decomposed, the sulphuric acid uniting with the lime or alkali of the carbonate and the iron, uniting with the oxygen, is precipitated as a brownish-yellow powder. Sometimes large accumulations of this iron oxide takes place if not washed away by floods, and in some instances considerable deposits of local conglomerate result from the cementing of the detritus lying in the gulch.

Metallurgical Machinery.*

By A. C. McCALLUM, Peterborough, Ont.

In the matter of the design of metallurgical machinery, it must be admitted, with reference to rolls, crushers, stamps and other machines employed in the reduction of ores, one is almost led to believe that they are not susceptible of as exact an analysis as a bridge, for example. In the following remarks it is purposed to deal with the most familiar machines employed by mining engineers, such, for instance, as crushers, rolls, stamps and feeders. To deal with them from the designer's point is my purpose.

Considering, in the first place, crushers, the introductory remarks anent them are applicable to most all of the other machines mentioned.

It will readily be admitted that many designs of crushers show by the distribution of the material within them that the designer neglected to take advantage of a method of analysis commonly employed by designers of bridges and other large structures, a system of analyzing quite applicable to mining machinery, namely, by that of graphics.

The construction of a graphic diagram of stresses within any machine under design is most essential, as upon it the designer elaborates his working drawing.

The benefits to be derived from such a process of designing cannot be overestimated; it impresses upon the designer an intimate and exact knowledge of the acting forces and their distribution throughout the parts of the machine in the process of design; there may be many problems which are complex and frequently unsolvable; it may be necessary, however, to possess definite knowledge of the resistance of the materials employed in the construction of the machine to those complex forces.

Knowledge of this kind can only be used as a guide by the designer, and in all probability he will be mainly influenced chiefly by experience and precedent, rather than altogether by calculation.

The usual resource of the merely practical man is precedent; but the true way of benefitting by the experience of others is not by blindly following their practice, but by avoiding their errors, as well as extending and improving what time and experience have proven successful. A continual effort should be made to advance mining machinery design to that of a science, not merely executing or copying what has already been done. We must look for marked improvement, as new applications of scientific principles for the reduction of valuable ores are brought forth, bringing with them change and simplification of design in the machinery required to perform the work needed to be done.

It has been sometimes remarked that skill and good workmanship are not essential features in the makeup of mining machinery; but the idea is false; more plants built for the purpose of ore reduction have been failures, due in large measure to the fact that the enterprise was handicapped by machinery ill adapted for the purpose.

Discussion will not alone settle the question finally in all cases without elaborate and unprejudiced experimental work.

Most careful investigation is necessary in many instances to discriminate between real improvement and the impractical.

Logical theory is confirmed by correct intelligent practice.

We who write at this late day are too much indebted to our predecessors, whether we know it or not, to complain of those who borrow from us, and each of us is only able to make his relay, taking up the work where others left off.

The *sine qua non* of good machine design, from a structural point of view, is the presence of sufficient material of the proper kind, in the right place.

There are many types of crushers upon the market, and the majority of them were originally intended for breaking road ballast. The demand within recent years for crushing machinery in mining regions is primarily the cause of their being advanced to the front as crushing and pulverizing machines.

The Blake type of crusher has developed few changes from the original design. The first type of Blake crushers had the crushing jaw pivoted at the bottom; as at present in general use the jaw is pivoted at the upper end. It is a matter of choice to do a given amount of work by either of the types of machine—one with the working jaw pivoted above, the other below. For the jaw pivoted at the bottom, the plea is used that a more uniform product is obtained, and that finer crushing, when that is desirable, can be secured. The concurrence of preference, however, if gauged by use, is in favor of the modern Blake design with overhung jaws when that type of crusher is chosen.

The graphic method of analyzing strains recommends itself. The composition of the forces may be easily calculated throughout any machine, given forces may be fully represented by straight lines, if the three following conditions are complied with:

1st. Magnitude, which can be measured by scale of equal parts.

2nd. Location. The lines representing a force being either parallel to or coinciding with the line of action of that force.

3rd. Sense, being the direction in which the force tends to move the body affected, and being indicated in some one way.

A general summary of crushers upon the market if analyzed by the method shown, would reveal the important fact of a want of harmony among the various types of similar dimensions. The dimensions of the openings are not called in question, but like pieces within different makes of crushers. So far as the openings of the jaws are concerned, those dimensions are not by any means arbitrary, but have been fixed by experience; quartz generally breaking in sizes which can be suitably crushed by ore breakers of such standard dimensions as 10x7 in., 15x9 in., 20x10 in.

Mining engineers in charge of plants are well acquainted with the many faults developed in crushers under their care—broken frames, pitmans, jaws and other parts are known.

What then are requirements of a good crusher?

In order that the crusher shall run easily, cool, and prove serviceable, it is requisite that all of the journals be in correct alignment one with the other. Rigidity, strength, and sufficient weight must be found in the frame, so that the vibrations created while crushing may become absorbed. This must be advanced as the reason for the failure of the many types of steel plate frames, they easily yield to the strains within the machine, thus causing the working parts to become out of proper relation one with the other, and resulting in heating, and running hard.

According to the nature of the product to be crushed, we must have a certain direction of stroke, length of stroke, and relative angle in the position of the jaws, and to procure those conditions various means are employed, which methods are well-known to mining men. But it has appeared to the writer that simplicity of construction may be secured by abolishing from the type of crusher under consideration the wedge block so common, and employing other means of adjustment, for instance by means of the toggles. Change of toggles can be effected as readily as by means of the adjustable wedge. The movement required can then be made by rearrangement of the toggles. The machine being provided with a set of toggles giving the requisite maximum and minimum openings.

It is necessary that the shaft supporting the jaw should be securely fastened to the jaw, not by means of set screws, a preferable method of fastening is that of the gib and key. The jaw shaft is then required to move in the bearings of the machine. This overcomes the pounding and jumping due to lost motion, which readily develops when the jaw moves upon the shaft. The caps of the bearings can then be tightened whenever wear renders it necessary.

Within the pitman much trouble is often created, perhaps no other feature within the makeup of the pitman creates more trouble than the adjustable devices provided to take up wear, when the eccentric shaft has worn out of round, due to the strain upon it being constantly in one direction. It requires a man of good judgment to set up the gib usually provided, and trouble once experienced within this bearing from heating cannot be readily cured, without stopping down the machine. By the application of a first-class lubricant, and employment of a high-grade babbitt, the life of the bearing here should compare favorably with any other within the machine.

The use of heavy wrought iron bolts through the machine taking the entire strain when crushing is a desirable feature, but care must be exercised to so employ them within the frame that their value as tension members cannot be called in question.

Fly wheels as commonly fastened to crushers are at fault.

By employing them as a means to prevent serious injury to the working parts of the machine, owing to sledge hammer heads falling into the jaws, or other causes, we may so fasten the fly wheel upon the shaft that in case of accident the belt may slip and the crusher stop while the fly wheels exhaust their motion. We may use taper keys rounded to suit the shaft, but a better method may be suggested, namely, that of the splitting the hub.

The matter of the application of lubricants is an important one. Prof. Thurston of Cornell University says:

"The art of economical employment of lubricants consists mainly in the determination of their adaption to specific purposes, and in the application to each machine—or to each part of a machine in which pressure on lubricated surfaces of widely differing amount is found—of precisely that quality of unguent which is best adapted to that particular place, and, above all, applying to it in the best possible way."

The employment of oil does not appear to be profitable. Grease is more economical, but a feature worth knowing in using grease is the matter of a proper kind of cup to hold the lubricant. The type of grease cup found most suitable is one in which the whole shell can be removed or unscrewed from the base, filled with the lubricant, then placed back in position. This does not necessitate the unscrewing of the entire cup from off the machine, the replacing of which is ofttimes an annoying matter, where machines are placed in badly lighted places.

As to the nature of cast steel jaw plates being superior to those of chilled cast iron, I am led to decide in favor of chilled cast iron. The first cost is less; the length of life of the chilled cast iron jaw plate compares favorably with that of cast steel.

Crushing Rolls.—The reduction or granulation of coarse particles of ore by means of rolls has been given much consideration during the past few years. The varieties of crushing rolls are many and various in type and construction.

Machines for this class of work have largely been evolved by American engineers, and proof of their superiority is to be found in the fact of their having gained admission to almost every large metallurgical works throughout the world.

Notwithstanding the many changes that have been made during past years in all the various designs known to us, no special one has met with general approval. The most potent change has been in the adoption of steel as the material for use in the construction of the shells. The construction of the frame in one piece, having sufficient weight and strength to absorb the vibrations set up within the machine, and closer study has been given to the matter of the strains with the structure.

Marked improvement over the older forms of crushing rolls has been made in the design of journal bearings, methods of lubrication, and the facilities for dismantling the machine if required. Considerable ingenuity has been displayed to obtain complete and satisfactory methods for keeping the lateral adjustment of the rolls correct. The adoption of springs for that of levers and dead weights within the machine, to give crushing power to the rolls, is an important improvement, affording, as it does, a much more uniform product.

The adoption of some form of housing obviates the wasteful and disagreeable nuisance of dust usually found around rolls employed in dry crushing, and length of life to the machine is ensured.

The most marked change within recent years has been along the line of increased peripheral speed, by the employment of rolls of larger diameters and narrower faces, the results being decrease of journal friction, increase of crushing surface, and reduction of spring pressures. Those changes are undoubtedly the direction in which modern practice is tending.

Peripheral speeds of 600 to 1000 feet per minute are now found to be practicable, but this change in speed has also brought about many of the improvements already mentioned.

The aggregate spring pressure is now greater, ranging from two to three tons per inch width of face of roll shells.

Change has also been made from gears to belts, proving a much more preferable method of driving. In the earlier form of rolls the spring pressure was carried along the main tension bolts, making it a matter of considerable labor to adjust the rolls. The method now in use consists of enclosing the whole nest of springs between two washers, and constructing them so that each nest forms a complete washer, of an inelastic nature, until such time when the maximum pressure is reached, further compression taking place, relief is afforded to the rolls by the deflection of the springs. Chilled iron shells in all probability will be displaced by steel shells. The hopper underneath the rolls is constructed in such a manner that no pockets are permitted, all four sides declining towards the bottom at an angle of 45°, affording cleanliness within the machine.

The matter of sliding versus swing bearings for the removable roll was decided in favor of swinging roll bearings. The wearing surfaces become reduced by means of their adoption. Any wear about the bearing surfaces of sliding roll bearings is an evil, which may result in damage to the frame of the machine. It is easier to maintain the alignment of the swinging bearing than in the sliding type of bearing.

In design for rolls, a feature worthy of consideration is that of the disposition of the bolts employed for the purpose of bolting the machine together. It is a desirable feature to have as few as possible, and so arranged that, should they by any means become loose, they may not fall within the machine. The use of common nuts is not desirable, and recourse must be made to lock nuts or elastic nuts. This provision prevents the bolts becoming loose, and may help to preserve the machine from injury.

Mortars.—The construction of mortars will always prove interesting to mining men. The sectional mortar contains a feature new to the writer. It is usual in the construction of sectional mortars to make the ends in two pieces. In one particular mortar, to overcome making the ends in the above way, they were carefully designed (not to exceed 350 pounds in weight), and in making the ends of cast steel the joint usually found was eliminated, and considerable strength has been thus added.

In a 3-stamp double discharge mortar the lower

*Condensed from Transactions Canadian Mining Institute.

guides of the battery are to be found in the upper part of the mortar, water supply being carried to and around each of the heads. The pulp from back screen running through a channel cored in base of mortar, and joining to that of the channel from front screen, is then carried by a pipe and distributed over the amalgam table.

Among designers of mining machinery the ore feeder has been taken in hand, and it doubtless has been observed in recent designs presented for public favor that of the suspended type shows many marks of improvement in design, utility and simplicity of construction. By its use considerable room is now afforded around the back of mortar, and it can be readily placed away from mortar when desirable. The action is similar to that of the Challenge type.

The marked changes in this feeder are to be seen in the abolition of the adjustable mechanism to the feed lever, the lever adjustment being made by means of a collar on the stamp stem, or by the bumping rod. Gears are not employed at all, thus resulting in quiet running.

One could, perhaps, make extended remarks with regard to other machines in process of design and manufacture.

Metal-Bearing Conglomerates.

Written for the MINING AND SCIENTIFIC PRESS.

For many years the existence of metal-bearing conglomerates has been known in various portions of the world, and deposits of this character have been and are now being worked with phenomenal success. The regions where conglomerates are being operated at present with large profit are notably in the Lake Superior region, where they are copper bearing, and in the Transvaal, where they are gold bearing. A great deal has been written concerning both of these extensive occurrences and their exploitation has attracted attention to conglomerates elsewhere. In California cemented gravels (conglomerates) occur, containing gold, in the beds of ancient river channels, and an instance has been mentioned by R. L. Dunn of an auriferous conglomerate in Siskiyou county, which he considers as being intercalated in the Cretaceous formation, which would give it a geological structure somewhat similar to the conglomerates of the Transvaal. These latter conglomerates and those of the Lake Superior region occur interbedded with sandstones and in both regions are traversed by basic dykes. In the Lake Superior region there are also sheets of eruptive rock (diabase, etc.) interjected between the beds of conglomerate and strata of sandstone.

In the Black Hills of South Dakota occurs a conglomerate of vast extent, entirely encircling the uplift in fact, forming a continuous bed of coarse mechanical detritus about 200 miles in length.

Conglomerate is usually considered a sign of nonconformability, and this conglomerate lies upon the upturned edges of the schists, slates and quartzites of the Archæan and forms the basal member of the Cambrian. As previously stated, it undoubtedly encircles the Black Hills uplift, which is that of a vast quaquaversal fold, fifty miles or more in breadth and much more in length. The sedimentary series dips away from the crest of the fold in all directions toward the surrounding plains, above which they rise like an island in an ocean. The conglomerates are the result of the degradation of the Archæan hills, the detritus having been washed down from the higher land into the surrounding Cambrian ocean, where the fragments were washed to and fro and rounded on the shore line until eventually covered with an accumulation of sand and other material, as the region gradually sank beneath the waters. It is not the purpose at this time to enter into a discussion of all the various features which characterized the geological history of the Black Hills, but to deal more particularly with the conglomerates. They may be traced for miles, and, while apparently absent over considerable areas, it is due to their removal by recent erosion or they are still covered beneath the later formations.

That the Archæan rocks were gold bearing prior to the laying down of the conglomerate there can be no doubt, for the destruction of these rocks freed the gold held in the veins and mineral-bearing zones, and the gold is now found in the conglomerates in several places in the Black Hills and in least two sections in considerable amount. The most noted is that in the vicinity of Central City, and Blacktail gulch, a tributary to Deadwood gulch. The conglomerates were here found near Terraville and between Bobtail and Deadwood gulch and also between Deadwood and Blacktail gulches, as remnants of the once continuous sheet, capping the hills and ridges, having been cut by the erosion of the gulches. North of Blacktail they reappear, dipping northwesterly into a high hill, and were followed some distance in the tunnels driven on the comglomerate and bedrock contact. These conglomerates, once lying nearly horizontal, have been tilted with the general uplift and dip to the northwestward. They are firmly cemented with silica, and so hard have they become that a mass will fracture across the inclosed pebbles and cobbles rather than around them. The gold found in the conglomerates undoubtedly was derived from the veins of the Homestake belt, and they have been worked with more or less profit over a large area. Where the conglomerate has covered the gold bearing formations of the Homestake and have been deposited on the southerly and westerly side of that lode, the conglomerates are no longer gold bearing, or at least only slightly so. A vast amount of the conglomerate which, from its situation, must have been rich in gold, has been eroded, and it was to this erosion that the gulches of the vicinity owe their richness, though had no conglomerate ever formed some of them would perhaps have been as rich.

North of Blacktail the mines have been worked extensively and profitably; but in the interior of the mountain under which they have dipped their continuity is interrupted by the intrusion of a large mass of eruptive rock. Some effort was made several years ago to rediscover the northward continuation of the Gustin belt, as it was called, (named from the Gustin mine), but without success. This was doubtless due to a lack of understanding of the geological conditions, for the conglomerate reappears within a mile to the northward, and northwest of Deadwood about one and a half miles. To what extent, if at all, the conglomerate at this point is gold bearing, cannot be stated. There is a series of faults which displaces the conglomerate and older sedimentary beds, making several exposures of the water-worn gravel, cemented with hematite and silica. It may be seen on the north and northwest sides of Polo mountain.

Over the conglomerate, as previously stated, was deposited a thick bed of sand. This has been metamorphosed by infiltration of silica into a hard, dense quartzite, which is ore-bearing in some parts of the northern hills, where it is known as the lower quartzite. The conglomerates vary greatly in thickness and are always made up of the fragments of the rock masses near which they are found deposited, and, as a result, they vary somewhat from place to place, but are, generally speaking, much the same throughout, and are composed of the fragments of the harder rocks of the Archæan—quartz, quartzite and the silicified slaty rocks which have been able to endure owing to their superior hardness, the softer rocks being reduced to sand and silt and mixed with the particles derived from the attrition of the harder rocks. In thickness the conglomerates range from a foot or two to more than 40 feet, the latter case being observed on the main fork of Castle creek, in the Central hills, four miles above Mountain City. At this place the deposit is more like a bed of coarse gravel than a typical conglomerate, the material being but slightly cemented. Farther east, on the opposite side of Castle creek, the conglomerate deposit is still thick, but cemented with carbonate of lime and iron. Three miles distant, on the south fork of Castle creek, the material is firmly cemented with limonite ore and silica, and the conglomerate, detached in great masses, lies scattered on the slopes of the hill below the outcrop. On the south fork of Castle creek, and three miles from Mountain City, is a prominent hill, shaped much like a large bell standing on its base and tilting slightly westward. The odd shape of the hill is due to the unequal weathering of rocks of varying hardness. It is capped with a limestone formation, in which are abundant fossils. Underneath the limestone is a thick deposit of sandstone, the lower portion of which is friable. This is the stratum which in the neighborhood of Deadwood is found resting upon the gold-bearing conglomerates, and which there has been metamorphosed into a hard, dense quartzite by the infiltration of silica.

The Castle creek occurrence is forty miles distant from the gold-bearing conglomerates referred to. Here the conglomerate is firmly cemented by iron and contains native copper. No exploration has ever been made of this deposit, consequently its commercial importance is unknown. The conglomerate outcrops about the base of the hill, entirely encircling it, and, consequently, underlies it. To what extent the conglomerate bed is copper bearing has never been determined. This occurrence is on the west side of the hills. To the eastward lies a broad Archæan area, on the farther side of which, about thirty miles distant, the conglomerate is again found on the eastern rim of the hills, and on an eminence near the village of Rockerville is gold bearing. Some effort was made years ago to develop and work this deposit, but for some reason the attempt was abandoned.

There are some strange things noted in the conglomerate deposits generally in the Black Hills, one of the most important being the occurrence of a large number of cobbles and pebbles of crystalline limestone. This might not be considered remarkable, except for the fact that no such rock is known to exist in the Black Hills, and these limestone fragments must have been derived from some formation now covered, the locality of which is unknown, but which must lie without the uplift of the Black Hills.

S.

Some Experiences of a Working Miner.

NUMBER XXVI.

Written for the MINING AND SCIENTIFIC PRESS.

The U—— mine was discovered by E——, a prospector who, after doing a little work on it, went to D—— and organized a company. For a time all went well and the stockholders put up promptly. A shaft was sunk about 55 feet and water commenced to come in. Sinking was continued to 70 feet, when it was evident that a windlass and bucket could no longer be used successfully. The prospect was only a fair one and the work might have been continued for a time had not the water become troublesome, but the newness of the corporate existence had worn off, no dividends had been paid and the stockholders became dilatory about putting up, and finally the mine was shut down. The discoverer, E——, did not know what to do. He was unable to develop the mine alone, so he started out on a prospecting trip and scoured the mountains in search of a mine he could work without assistance. After several months spent in a fruitless search, he gave up the idea for a time and began to seriously consider searching for a job some place. He had fully made up his mind to go to some camp where mines were in operation and get a position of some kind, but, before going, went down the U—— shaft to see in what condition things were. He found them all right, and the water standing where he first encountered it—55 feet from the surface. He dug into the exposed wall of the shaft with a small pick and gouged out a small quantity of soft material from a seam in the porphyry. The stuff looked black and soot-like, and he concluded it must be black oxide of manganese and might carry some value, but the seam was so small that he had to gouge for some time before he could get enough of it to amount to anything. He persevered, however, and after several hours work, during which time he put in a temporary platform across the shaft, he managed to collect about two ounces of the black mineral. He took it to his cabin and put it in a tin box. The following day he started for a mining camp twelve miles away to hunt up a job, and took the tin box along. When he reached D—— he met some of the members of the company and showed them the contents of the little tin box. They fingered the heavy black stuff and variously passed their opinions that it was manganese or iron, or both. E—— wanted them to have an assay made, but this useless expense they refused to pay. After some argument he got two of the principal stockholders to accompany him to an assay office for the purpose of having the assayer pass opinion on the rock. The assayer looked at the contents of the box a moment and then remarked inquiringly "Well?"

One of the stockholders said, "E—— has brought us in here to have you pass judgment on that stuff. I don't think it necessary to assay it."

"Nor I," replied the assayer. "I will melt it into a bar if you like, though."

"Bar!" exclaimed all three. "Bar of what?"

"Silver, of course," said the assayer. "I thought you fellows knew what it was."

"No, what is it?" asked the three in a breath.

"Why, black sulphide of silver," replied the assayer. "You are a great lot of miners. Where did you get this, E——?"

"I got it in the shaft of the U—— mine," replied E——. "I always told you there was a mine there."

"Well," said the assayer, "how much of it?"

"Only a little streak, but it may lead to more," said E——, "and if you stockholders will put up a little money we may find a big body of it."

"How much will it go, M——?" inquired one of the stockholders.

"About twelve thousand or thirteen thousand dollars a ton, I guess," replied M——.

Inside of two hours several hundred dollars had been raised and E—— was on his way back to the mine with provisions and two men, and work was recommenced in the U—— mine. A drift was started following the streak of rich rock. It was like a knife blade, but could readily be traced. For 60 feet they drove through the soft porphyry. Late one afternoon a shot was put in and the men went to the cabin for the day. Since starting work not one of the stockholders had come to the mine, and, as there was nothing of particular interest, they were becoming a little unconcerned again. The morning following the shot referred to the men went down into the mine, and in the face of the drift the shot had broken into a fine body of ore. Nothing could be told of its extent, as the hole in which it was exposed was not over 2 feet square, but the ore was fine-looking galena and carbonate of lead, with siliceous brown iron ore over which was plastered flakes of horn silver. As soon as possible E—— had saddled his horse and with a sack of samples started for D—— on a gallop, telling the men to take a holiday. They did nothing of the sort, however, for, being good men, they had the success of the mine at heart and went to work with more energy than they had ever before shown.

E—— reached D—— in a short time over the rough mountain trails. He met the directors and a

number of the principal stockholders and before noon several wagon loads of these gentlemen, now fully awakened to the possibilities of the U—— mine, were on their way to the camp, which they reached several hours later. The miners had put in several small holes and had cleaned up. The entire face was in magnificent ore and they had hoisted a good-sized pile to the surface.

It is needless to say that within a very few weeks a fine hoist and building covered the shaft and the mine was rapidly developed. It was worked steadily for a long time and paid handsome dividends, and all turned upon the fortunate day when E—— went down and scraped two ounces of rich ore from the blocks of porphyry, but E—— was not a man easily discouraged.

* * *

For a long time W—— was superintendent of the M—— mine. One day one of the owners came into the mine, and, after an inspection, suggested that a small vein in the hanging wall be followed. W—— who was a good miner and kept himself posted as to the condition of his mine, knew that there was little or no gold in this vein and did not act upon the suggestion, but did follow a small vein into the foot wall which prospected pretty well. Some days later three of the owners were in the mine, among them being the one who had offered the suggestion a few days previous. When the vein breaking into the hanging wall was reached this gentleman remarked to one of his older companions: "Here is that vein I was speaking of. I think it would be all right to start a drift in here."

"Why, of course," replied the other, "that's the place to work and not over here on this other side. Anybody who knows anything about a mine at all would know enough for that."

W—— for a wonder said nothing. The gentleman who had last spoken turned to the third visitor and remarked: "C——, what do you think? Don't you think the pay goes into the hanging here?"

"No," said C—— bluntly. "I think W—— is right. The pay is in the foot wall streak."

The other turned away in disgust and remarked testily, "You don't know any more about a mine than W—— does."

The work proceeded for several weeks, and the little foot wall seam developed into a good-sized ore body and paid well. The bullion bars did more to convince the stockholder that he didn't know it all than any other argument could have possibly done.

MINER.

How Our "Pictures" Are Made.

Engraving is divided into two processes. By the one outlines, shadows and half tints are represented by incisions meant to contain the printing ink, while the parts meant to come out white on paper are left untouched. Metal work and copper plate engraving belong to this class. In the other method the lines are drawn on or chemically transferred to a flat surface, and afterward the wood or metal is either cut away by hand or etched away by acid, leaving the design standing out in relief. All the illustrations in this paper, wood cutting, zinc etching and half-tone work are of this nature. In the first division the only style of work referred to which is applicable to newspaper illustration is the chalk plate work. In this process a thin steel plate is coated with a preparation of chalk. The artist draws the picture on the chalk surface by using steel needles and fine pointed steel tools, with which he cuts into the chalk, so that when he has finished his work there is a complete drawing on the chalk plate in which all the lines are made by the incisions in the chalk. The drawing finished, the plate is ready for stereotyping.

It is the second division with which modern illustrating is principally associated.

Wood engraving is about as old as the art of printing itself, the principle being that the surface of the block produces black, the white parts of the drawing being cut away, so that when the block is inked the lowered parts cannot come in contact and are thus left white. To produce the effect of all the intermediate shades between solid black and pure white a series of lines and dots, varying in distance apart and in breadth must be employed. A very light portion in the finished print would be produced by leaving fine lines or dots, and cutting out wide spaces between them, and from this to the solid black in the finished print the lines would be coarser and the spaces cut away narrower, until in the solid blacks the wood is not cut away at all. Most of the cutting on wood is done by hand; however a machine is now used for the mechanical ruling and shading. During the first years of this journal's existence it was necessary to draw all the subjects on the wood before cutting the engraving, and all the wood used was soft; now, however, hard boxwood is used for most work, and after coating the surface of the block with a solution, sensitive when exposed to sunlight, a print is made on the wood by using a negative made from the object to be engraved or from an artist's original drawing. When the block is finished the electrotyper takes a mold of the block in wax. This wax mold is covered with a thin coating of black lead, this being a good conductor of electricity. The mold is then suspended by a brass rod in a large bath filled with a solution of sulphate of copper and sulphuric acid. A current of electricity from a dynamo is conducted to the wax mold in the bath and also a sheet of copper placed near the mold. The electricity decomposes the copper and deposits it in small particles on the mold on which a thin coating of copper is formed, producing an exact facsimile of the original engraved block. This copper reproduction is filled in at the back with metal and mounted on a base so as to make the cut type high, and is then ready for printing.

Zinc etching—"line work"—is the process in most general use. The primary essential for a good result in zinc etching is a pen sketch drawn with black ink on a good white paper, in which all the various degrees of light and shade are produced by a series of dots and dashes or lines. Other originals than a drawing can be used, but as the process is one of reproduction by photography the nearer the copy is to a good drawing the better will be the finished cut.

The drawings as a general thing are made to be reduced one-third or one-half. They are made larger for the reason that any imperfection there may be will not show so readily when reduced, and the finer detail can be worked up much better in a large drawing than in a small. When the drawing is finished it is turned over to the engravers. A photographic negative is made the size the finished cut is to be. The negative is dried and printed on zinc previously polished and coated with a sensitizing solution. The print on zinc is made in a similar manner to that employed in making a photographic print, the sensitized zinc place taking the place of the sensitized paper in a photo print. The print on zinc can best be made in good strong sunlight, an exposure of from eight to fifteen minutes being necessary, according to the density of the negative. If the day is cloudy or the work must be done at night, the print is made by using a strong electric light, when it is necessary to make a much longer exposure. The action of the sun or electric light chemically changes the albumen solution on the zinc plate in just the places where the negative is transparent; these transparent portions correspond exactly with the lines on the original drawing. After the plate has been exposed the proper length of time it is rolled up with a special ink and then developed, all of the ink being washed off except the portions chemically acted upon by the sunlight. These portions, as stated above, are the same as the lines in the original drawing, so that when the plate is thoroughly developed we have a perfect facsimile of the original drawing on the zinc. The plate is next powdered up, that is, brushed over very carefully with "dragon's blood," a prepared resinous powder, the powder adhering only to the ink lines which show on the print. After the powdering the plate is highly heated so that the powder just applied is melted and joins chemically with the ink lines and forms a solution which resists nitric acid. As soon as the plate is well burned in it is put in a weak solution of nitric acid and by giving the tub of acid a rocking motion the exposed portions of the plate are etched or eaten away. When the proper depth is reached the plate is dried and again powdered up, and the same operation of etching is gone through with again. Each separate etching of the plate after it has been powdered up is termed a "bite." Plates are given from three to five bites according to the subject. When the etching of the zinc is finished the plate is ready for routing. The routing or cutting deeper of the large open spaces, which are to appear white in the finished print, is done by means of a machine which has a revolving spindle so arranged that it drills or cuts away the superfluous zinc very rapidly. The cuts illustrating recent patents on the opposite page of this issue afford an example of what are usually termed "zincos."

The latest and quickest method of producing cuts for papers is the half-tone process.

The best copy for half-tone work is not made up of lines and dots as for the methods previously described, but must be one in which there are all the various gradations of lights and shades; that is, one in which all the half shades or half-tones are shown. A photograph or wash drawing is such a copy.

The difficulty of the early process workers was to find a satisfactory method of reproducing these half-tones of the photograph in surfaces for mechanical printing.

In typographic blocks it was easy to reproduce high lights and blacks, as described in the process of wood cutting; but what would become of the half-tones? It was not possible by the process of passing a roller over a block to lay half a shade of ink on certain portions of a block. Thus it was a picture without half-tones; a picture of pure whites and solid blacks. But the early process men kept at work and noticed how the wood engraver produced the different degrees of light and shade and that the steel plate etcher and lithographer secured their different gradations of color by taking advantage of fineness or coarseness of stippling or the grain of a coarsely ground stone. Thus it was argued that if the half-tones of a photograph could be broken into some sort of a grain or dot the problem of making the photograph into a printing block would be solved. This problem has been solved. The first attempts were made by placing a piece of coarse cloth in front of the sensitive plate for a negative. In this way the photographic image was broken up into a grain which reproduced the photograph in dots of varying sizes. Half-tone reproduction was accordingly achieved, and the method was called the half-tone process.

Having a good photograph to work from, the first important requirement is a screen. This consists of two pieces of plate glass cemented together, and on the inner sides of the two plates are ruled parallel black lines, the lines on one plate crossing those on the other at right angles so as to form a network. The screens are ruled in various degrees of fineness, the ruling determining the grain point. For cheap paper, such as for poster work, about fifty-five lines per inch are used. For newspaper work about 85 to 100 line screens are used, and for such half-tones as those on pages 113 and 120 screens ruled from 133 to 175 or even 200 lines per inch are used. The finer the screen used the greater the amount of detail preserved; the coarser the screen the greater the contrast. What is required in a half-tone negative is a means of printing the picture on the zinc or copper plate in dots of varying size—big and medium dots for half-tones, and fine dots for high lights. Now, to have dots, one must have a negative, punctured, so to speak, with holes. This negative is secured by placing the screen in front of, but not in contact with, the sensitive plate. The screen is placed about 1-32 of an inch from the sensitive plate. The negative made, it is printed on zinc or copper and developed in a manner similar to that employed in zinc etching. The plate is developed until the sensitized enamel solution is left only on the dots, the spaces between being washed away until the surface of the copper or zinc is left bare. The plate is then "burned in," and the enamel solution on the dots is hardened so as to protect them from being etched away. The plate is then etched in a solution of per-chloride of iron and is left until the dots stand in sufficient relief to yield a printing surface. The coarser the screen used the deeper the plate can be etched, and consequently the coarse half-tone prints better on a cheap paper; and as the dots are larger, they take the ink better on the high-speed press. For this reason the coarse screen half-tone is most suitable for newspaper printing, but such cheap work would not look well in the columns of the MINING AND SCIENTIFIC PRESS.

The methods of producing half-tones are being continually improved. There is now a method being worked up of producing a half-tone plate without the intervention of a screen, and some quite successful results have been obtained. Half-tone negatives are also made direct from the object, so that a great deal of time is saved by not having to wait for a finished photograph.

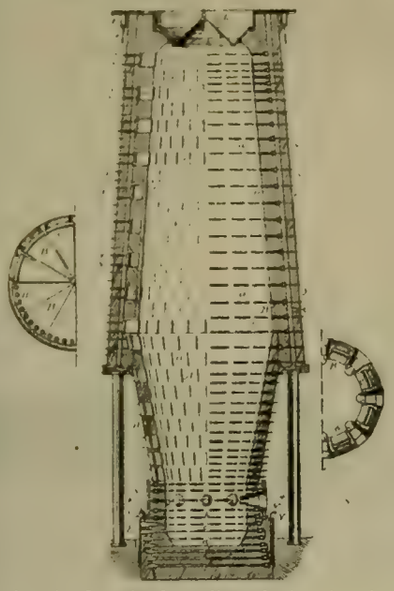
Worthy of Unanimous Support.

J. F. Halloran, the publisher of the MINING AND SCIENTIFIC PRESS of San Francisco, stopped at Salt Lake, Monday, en route home from the East, where he has been agitating the establishment of a new cabinet office of mines and mining. Mr. Halloran's efforts are in a good cause, and he should have the support of the entire mining press of the United States. No industry is more important, and yet it receives very little encouragement from the Government.

The men who have stormed the rocky fastnesses of rugged mountains, braving the Arctic winters of the north and the burning suns of the south, as well as the capitalists who have made it profitable to mine ores that formerly were almost worthless, have done these things without aid or encouragement, while thousands of dollars have been expended in the interest of agriculture. A decided and unanimous effort in the right direction should be successful.—Editorial in the Tintic Miner, Eureka, Utah.

The Best in the World.

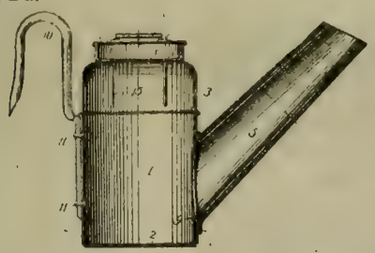
Without doubt the best all-round mining paper published in the world is the MINING AND SCIENTIFIC PRESS of San Francisco. It is the best for the miner and the mine owner and the best for the "man of the shears" looking for stuff to fill the mining department of his paper, for everything in the MINING AND SCIENTIFIC PRESS can be reproduced with profit. The large number of articles that appear in the *Pioneer-Times* credited to the MINING AND SCIENTIFIC PRESS is evidence of the esteem in which that paper is held.—Editorial in the Pioneer-Times, Deadwood, South Dakota, July 21st.



A MINER was killed in a Shasta county, Cal., mine a few days ago as a result of tamping a hole with an iron bar. The State of Colorado makes it a misdemeanor to use a metal bar for this purpose, and every mining State should enact a similar law. High explosives do not require hard tamping, and a wooden stick is much safer and fully as satisfactory for tamping holes. It is even unnecessary to strike it with a hammer. The tamping should be pressed in, not pounded in.

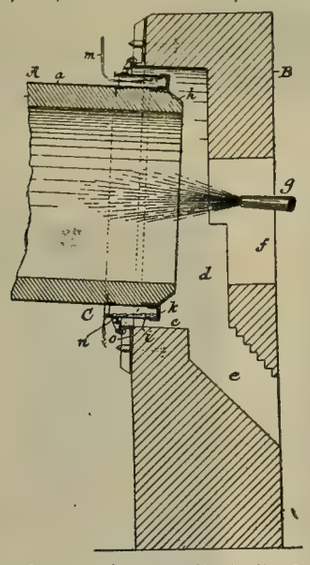
Latest Mining and Metallurgical Patents.

Patents Issued July 17, 1899.



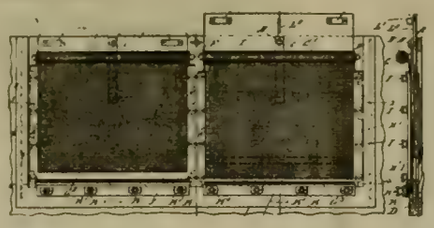
Specially Reported for the MINING AND SCIENTIFIC PRESS.

COOLING DEVICE FOR FURNACE WALLS.—No. 628,790; A. P. Gaines, South Pittsburg, and C. J. Gustafson, Sequache, Tenn.



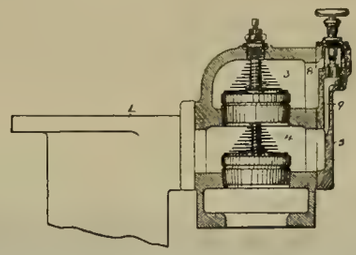
The herein described cooling device for furnace walls, consisting of a composite plate formed of a solid metal plate of high heat conducting power and a protecting plate of other metal capable of resisting wear cast upon conducting plate, the inner end of conducting plate being exposed so as to conduct heat from the furnace chamber, composite plate being provided at its outer end with a cooling chamber for circulation of a cooling medium to abstract heat from the outer end of conducting plate.

MINER'S LAMP.—No 628,653; W. A. Dunlap, Pittsburg, Pa.



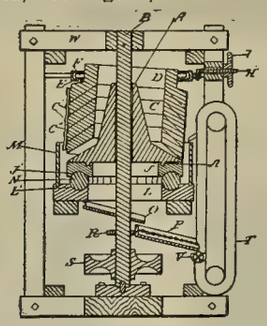
A miner's lamp having in combination a seamless body portion, a seamless breast and neck portion seamed to the body portion; a double wick spout, the inner spout being seamed to the outer spout and the latter seamed to the body portion.

ROTARY FURNACE.—No. 628,940; E. H. Hurry, Bethlehem, Pa., and H. J. Seaman, Catasauqua, Pa.



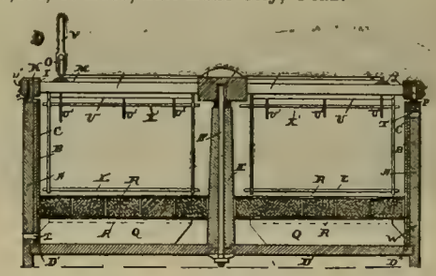
A rotary furnace downwardly inclined, provided adjacent its end with a jacket closed at end nearest the end of furnace, open and unobstructed at the other end and having its annular inclosing wall extending toward the rear of the furnace inclined from the closed end upwardly with reference to a horizontal line, and a water feed-pipe discharging a jet of water directly into the open unobstructed end of the jacket.

SCREEN FOR STAMP MILLS.—No. 629,242; M. R. Driscoll, Utah.



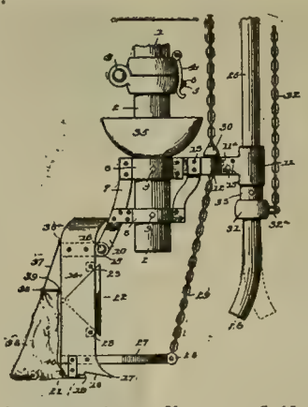
A stamp mill, having an apertured frame, a roll of screen material mounted above the aperture and having a portion extending over the aperture, a clamping frame extending about the lower and side edges of the aperture and covering the edge of the screen material, frame having vertically extending bolt recesses in its side bars, clamping bolts within recesses and an auxiliary clamping bar engaging the outer face of the lower side of the clamping frame. Clamping frame extending about the lower and side edges of the aperture and covering the edges of the screen material, means for releasably securing the members of the clamping frame and the screen beneath it to the screen frame, and an auxiliary clamping bar engaging the outer face of the lower side of the clamping frame. An auxiliary clamping bar engaging the outer face of the lower side of the clamping frame, a gate mounted to slide vertically at the rear of the screen, and inclined guides engaging the lower edge of the gate to force it laterally to its seat as it reaches its lowermost position.

PRIMING DEVICE FOR PUMPS.—No. 629,002; E. M. Coryell, New York, N Y.



The combination with a valve box containing upper and lower chambers, of a cover or bonnet therefor having within the thickness of its own walls an entirely closed passageway having only two outlets —one communicating with the upper chamber and the other with the lower chamber, and a valve controlling passageway, the passageway being located entirely within the thickness of the bonnet, and opening only into chambers. The valve box containing upper and lower chambers, open at one side, a cover or bonnet for closing open side of the chambers, an enlargement on bonnet, a recess within enlargement, ports or passages leading from recess, one to the upper chamber and another to the lower chamber; passages or ports being located entirely within the thickness of the wall of bonnet and opening only into chamber sand recess, and a valve in the recess for opening and closing communication between the chambers.

ORE CRUSHER.—No. 629,098; B. I. Turman and T. J. Hampton, Los Angeles, Cal.



In an ore crusher the combination of a rotating shaft a frustro-conical metallic runner slidably mounted on a squared portion thereof, a cylindrical shell surrounding runner and supported thereby, means for holding and guiding the upper portion of the shell in a position eccentric to the shaft, a ring surrounding the shaft immediately below and engaging and supporting the runner, and having an annular race or groove in the under surface thereof, a stationary annular bedplate having an annular race or groove formed in the upper face thereof, pulverizing balls adapted to fit between groove and the annular race in the upper face of the ring which carries the runner, a peripheral casing or curb extending up from the bedplate, a chute or apron below the central opening in the bedplate and adapted to receive the ore therefrom, a screen receiving the ore from the chute, and adapted to separate the thoroughly pulverized portion from the coarser, a wiper wheel mounted on the shaft and communicating motion to the screen, and a return elevator receiving the coarse overtail from the screen and redelivering it inside the casing to the pulverizing balls; the central operating shaft *B*, runner *A* slidably mounted on shaft, shell *C* surrounding runner having collar *D*, frame *F* having anti-friction rollers *F* surrounding collar *D*, threaded bolt *H* having hand wheel *I*, ring *J* having an annular race *J'* in its lower face, immediately below and engaging with runner *A*, annular bedplate *L* having a groove *L'* in its upper face, pulverizing balls *N* fitting in race *J'* and groove *L'*, casing *M* surrounding bedplate *L* and extending above the base of the runner *A*, chute *O* below the central opening in the bedplate and adapted to receive the ore therefrom, screen *P* adapted to receive the ore from chute *O* and separate the thoroughly pulverized portion thereof from the overtail, wiper wheel *R* mounted on shaft *B* and adapted to impart a shaking motion to screen *P*, screw *V* adapted to convey the overtail to elevator *T*, and elevator *T* adapted to convey the overtail into casing *M*.

CELL FOR THE PRECIPITATION OF METALS.—No. 629,134; J. Luce, Salt Lake City, Utah.

In a cell for the precipitation of metals, a tank, a revolving frame mounted thereon for carrying the cathode, combined with the anode, consisting of two slotted lead plates, one of which is connected with the circuit, a series of carbon blocks placed between them, the cathode elements and electrical connections. The anode consisting of two slotted lead plates, one of which is connected with the circuit, a series of carbon blocks placed between them.

MINING DREDGER.—No. 629,048; L. D. Sibley, Vineland, N. J.

In a mining excavator or digger, a fluid pressure pipe for conveying fluid under pressure to be forced into the earth, a frame fixed to pipe, above the open delivery end thereof, a shovel hinged to frame at a point to one side of the pressure pipe, and means for raising or lowering the hinged scoop, whereby the scoop may be raised to a horizontal position or lowered to a vertical position at one side of pressure pipe. The combination with a fluid pressure pipe and a hinged shovel or scoop, of a reflecting pan adapted to deflect the current of pressure fluid from pipe and protect the contents of the shovel or scoop from the action of pressure fluid. A main pressure pipe, with a shovel or scoop supported by main pressure pipe and provided with an inclined face and a pocket or depression in rear of inclined face and adapted to retain minerals of greater specific gravity than the surrounding washings which are agitated by a current of pressure fluid, and an auxiliary pipe arranged at one side of the pressure pipe and provided with a deflected or inclined nozzle. A reflecting pan carried by the scoop and arranged to be raised thereby into vertical alignment with no outlet from the pressure pipe, and a reflecting cup supported by pressure pipe above the discharge mouth thereof, cup adapted to deflect the pressure fluid in outward direction against the walls of the cavity or excavation made by the action of the dredger and to collect particles of mineral which may gravitate into cup. A collecting shovel and a collecting bag or sack attached to shovel and adapted to gather fine particles of mineral by its flexible lower and thin front edge.

Some Properties of Copper.

Apart from electrical requirements copper probably owes its present extended use mainly to custom, and its first selection was, no doubt, due to its non-liability to corrosion and to its great ductility. The latter, however, is a variable quantity, depending largely upon the treatment to which it has been subjected, and depending also upon its composition. When copper has been thoroughly annealed it is very soft, and a very low stress, say, even less than two tons per square inch, will produce a slight permanent set. As the stress increases the deformation increases more rapidly, and at a tensile stress of from thirteen to fourteen tons per square inch, calculated from the original section, fracture will take place. In the case of good copper, which has been previously properly annealed, the elongation in 8 inches will be about 30% to 40%. If the copper is stressed to any less amount than its ultimate strength and the load released, it will be found that the stress has hardened the copper, and that the metal will then be practically elastic up to nearly its original load, less stress than this producing no further permanent elongation. If, after this hardening, the copper is again annealed, it will behave as it did in its original annealed state, a low stress again producing a permanent elongation.

Commercial copper, as used for other than electrical purposes, is rarely pure, or even nearly pure. The effects of some of the common impurities, such as arsenic, nickel and silver, are supposed not to be detrimental; while on the other hand antimony is objectionable, and bismuth, even in small traces, is exceedingly prejudicial. The usual workshop test for the quality of copper is to cut off a portion of the pipe or sheet and anneal it, when it should stand bending quite close, without a sign of cracking. The edge should also stand thinning to a knife-edge without crack when hammered to a scarf joint form with a lap of about three or four times the thickness of the copper.

THE successful cyanide plant of the Great Boulder Main Reef Co., Australia, consists of rock breakers, drying furnace, ball mills, a "shaft" or tower furnace and the ordinary cyanide equipment. The general manager, E. Skewes, made choice of a plant which, while simple in construction and easily repairable, also permitted the definite control of operations at each stage of the work. For roasting the ore his choice was a furnace similar to that used at Mount Morgan in Queensland. The work of erection at the mine was begun in September, 1898. As now finished, this furnace is a tower 65 feet high, 30 feet long and 12 feet wide. It is divided into eleven floors by arches one above the other at distances varying from 2 feet 6 inches to 4 feet. The walls are of solid brickwork, 2 feet in thickness, braced with iron girders on the outside.—Kalgoorlie Miner.

Conservation of Water.

The movement begun last November by the California State Miners' Association toward the conservation of water is engaging present attention among many who realize how much that matter means to the commonwealth. It is a question that affects not only California but all the States and Territories west of the 100th meridian, for upon the proper conservation of water lies largely the industrial welfare of the future of all that great region. The presence here of Elwood Mead, in charge of the work entrusted by the last Congress to the proper Government department, makes it timely to reproduce from his last report, as State Engineer of Wyoming, some engravings which are significant of kindred opportunities in California. These picturesque portrayals are not depicted here for their inherent beauty, but have a profound industrial significance as a demonstration of available water in one of our arid land States. So far as the scenery is concerned it might be labeled Colorado or California or Idaho, but the engravings faithfully portray possibilities for conservation of water in Wyoming and are as applicable in speaking of similar possibilities in other States. Secretary Wilson, under whose direction Mr. Mead proceeds, is now in California anxious to inform himself upon forestry and irrigation needs, as well as other desiderata, and it will be a good opportunity for those interested and acquainted with the facts to get a hearing.

Divide Between Little and Big Goose Creeks.

Dome Lake Reservoir.

Dam at Outlet, Dome Lake.

Picturesque Headgate and Dam on a Wyoming Stream.

IN Moravia, at Ellgoth, in the Ignaz shaft, instead of provisionally lining it with timber, brickwork was put in at once in sections of 4 to 7 yards as the sinking proceeded. This method, which had not been previously used in the Karwin coal field, is said to save time, labor, cost of material and seems to present greater security for circular shafts.

Characteristic Mines of the California Gold Belt.

NUMBER IX.

One of the most noted mines in the State is the Morgan mine, in Calaveras county. It covers the summit of Carson hill and extends northward some distance toward Carson creek. The croppings constitute a great mass of quartz 40 feet wide in places. The great vein has a peculiar banded structure consisting of wavy ribbon-like strips of quartz, an inch or two in width, though differing in appearance from the bluish ribbon rock common to veins in slates. The structure of this vein is unlike that of any other in this part of California, and is not confined to the surface, but extends to considerable depth. In a crosscut tunnel the vein is exposed where it possesses the same structure and is 65 feet wide. Usually these large masses of quartz are flinty, milky or vitreous, and contain little sulphide mineral or gold, but the Morgan vein contains both.

On the surface and in the hanging wall of the great vein is a pit, now about 30 feet square, though probably originally smaller, the sides having caved and enlarged its dimensions somewhat. This hole is in a soft, much decomposed iron-stained material which is traversed in all directions by a network of quartz seams, varying from little seams to veins 4 inches or more in width. It was this ordinary looking cut that first brought fame to Carson hill. It is claimed, on what may be considered responsible authority, that nearly $3,000,000 was taken from this hole in the early fifties, the rock being pounded up in hand mortars. The gold occurred in masses and twisted rope-like strips. One of the men who worked in the mine and assisted in removing this gold told the writer that large pieces of gold were found projecting from the quartz after a quantity had been shot down, and the men would grasp them firmly with both hands and swing upon them, endeavoring to wrench them from the matrix, but without success. Holes were drilled as usual and black powder was used in blasting. It was customary to cover the rock face with rawhides, which were weighted down with rocks, timbers, etc., for the purpose of preventing the golden fragments from flying when the powder exploded. It is said that the largest amount of gold ever taken from a single place came from here, as well as the largest single mass. The mine, at one time equipped with a 40-stamp mill, has been idle and in litigation for many years.

As has been previously stated, the dolomite vein splits in Tuolumne county south of Carson hill, crosses the Stanislaus river and reappears as a series of separate, large veins on the hill itself, continuing to the crest and down the north slope to Carson creek, where it disappears and is seen no more for thirty miles, when it reappears at Jackson, Amador county. Between Carson hill and Angels Camp, a distance of five miles, there are a great many mining claims, some of which are extensively opened, and some give promise of becoming productive mines. When Angels is reached the gold belt is found spread out over a width of nearly three miles, extending from the Star of India group on the west to the Birney ranch, a mile east of Angels. The largest and most productive mines thus far opened in this part of the belt are at Angels, the principal mines being the Utica-Stickles and Madison-Gold Cliff properties. Other mines have extensive development, but those mentioned are the largest.

The Madison-Gold Cliff property is conspicuous for its massive quartz croppings, and is thought by many to represent the main fissure of the mother lode, but there are other outcrops nearly as large east of Angels, and it is very uncertain and, indeed, entirely unimportant which is the main fissure, as the largest and richest mine in the district was not considered as being on the main lode in early days, for the reason that it did not possess a bold outcrop of barren quartz.

The Madison mine is opened by an inclined shaft about 1500 feet in depth, levels being run at every hundred feet, the longest connecting with the Gold Cliff mine on the north. Long drifts are also run south from the main shaft. These drifts are all of large size, being 6 to 20 feet wide and 10 to 20 feet high. In all this development of thousands of feet of drifts, shafts, raises and winzes there are very few excavations that may be considered stopes, and it is one of the few mines which has paid for blocking out in this manner, that it has been claimed cannot be profitably stoped, as the rock is so low grade that it will not pay for the cost of the necessary timbering should stoping be carried on extensively, and, of course, would not pay for filling. The gold-bearing material is chiefly silicious chlorite schist, altered from diabase. The massive quartz of the croppings continues in depth, with varying thickness, 4 to 60 feet, but is always low grade. Several attempts have been made to mill this rock, but it has never been found to pay. The zone of gold-bearing chlorite schist lies in the foot wall of this massive quartz vein, which extends unbroken throughout the length of the claim and beyond. In the laminations of the schist are thin sheets of quartz and calcite. The entire mass, 5 to 20 feet wide, carries gold and about 4% auriferous sulphide (mostly pyrite). The pay zone is often found in direct contact with the massive quartz hanging wall and as often at a distance from it. Small banded veins of quartz, probably representing a more complete stratification of the schist, are found at intervals in various parts of the mine, lying on a smooth, well-defined wall, which usually forms the foot wall of the zone. These small veins are from a few inches to 2 or 3 feet in width, and are generally higher grade in gold than the schistose zone.

The massive quartz vein on the hanging side is often found crushed to a granulated mass like coarse salt, which is doubtless due to movement and a tremendous crushing force exerted upon it since its formation. Throughout the gold belt this evidence of movement, the crushing of vein quartz, is of very frequent occurrence, but usually the brecciated material is found recemented with silica or carbonate of lime, or both.

On the hanging wall side of the great quartz vein in the Madison mine is found a putty-like gouge varying from a foot to several feet in width. The gouge includes many fragments of quartz and diabase.

The Gold Cliff mine, adjoining the Madison on the north, is essentially similar in most respects in the lower workings. The upper portion of the mine was worked by an extensive open-cut system, and the large exposure in the cut showed some peculiar geological features. The hanging wall was found dipping quite regularly to the eastward at a high angle, and was usually defined by the massive quartz croppings, although these were not as large as those at the Madison. The foot wall on the surface over a hundred feet distant at the north end of the cut slopes eastward at a lesser angle and southward approaches the hanging wall. In this large, trough-like segment formed by the converging fissures, the material was largely amphibolite (chlorite) schist altered from the massive diabase. Some quartz was found in irregular, veinlike masses along the foot wall side and toward the south end of the cut, which is several hundred feet long; the volume of quartz increased until it met the main mass on the hanging wall side. Lying nearly flat and extending from wall to wall was a series of quartz sheets, one above another, dividing the mass into sections like floors. These sheets were at varying distances from each other, ranging from a foot or two to 10 feet or thereabouts. In size they varied greatly also, from an inch to 2 or 3 feet in thickness. Irregular masses of quartz also occurred, disposed at random throughout the mass. The entire occurrence suggested that a compressive force had been exerted from without the walls, resulting in a fracture of the schistose mass within, uplifting it along the jointing plane, with the subsequent formation of the floors of quartz. The entire mass was found auriferous, but low grade. It is said to average $2.50 per ton, but was worked at considerable profit by the open-cut system, and large stamp capacity—four to five tons per stamp—water supplying power.

W. H. S.

Nickel and Cobalt.

South America was formerly a great source of nickel and cobalt, some of its hydrated arsenites testing 25% in the ores of nickel, and 17% in the ores of cobalt. A. S. Johnstone, who is a very good authority on the subject, says that the only mine in Connecticut has been worked for many years, while Sweden has yielded nickel from the Klefra and other mines. In Germany the supply of nickel is obtained principally from the Mansfield mines. The rich nickel deposits of New Caledonia now furnish a large proportion of the supply, and important shipments of the ore are going forward to Europe. This ore is a double silicate of nickel and magnesia, the percentage of nickel ranging from 7 to 10. Nevada, however, is the latest source of supply, both of nickel and cobalt. In 1880 a powerful impetus was given to the utilization of nickel for manufacturing purposes by the invention of Wiggin & Co., Birmingham, for rendering the metal malleable by the use of manganese. A year later a German inventor, Dr. Fleitmann, accomplished the same result by the use of magnesium. Thus produced nickel may be drawn into wire or rolled into plates, and may be stamped, beaten, raised or welded. The adoption of nickel for coinage purposes by Germany in 1873, raised the price of the material from 4s to 16s per pound, but this inflation was only temporary, and the average price to-day is about 2s per pound. The oxide of the metal is used in the Staffordshire potteries for giving a soft brown tint to china and earthenware. Cobalt is used chiefly as an anode in plating, and for some parts of scientific instruments. It does not whiten copper to the same extent as nickel. The oxides of cobalt are of very great value in the coloring of china, earthenware and glass, and form the basis of the pigment known as cobalt blue. The present day tendency is to replace brass and electro plate by white alloys which have nickel for their basis. These alloys are known by such names as silveroid, argentoid, navoline, nickeline, etc., but they are all varieties of German silver, mixed either with tin, lead, or cadmium, according to the requirements of the metal. Nickel and cobalt ores are very largely smelted in and around Birmingham.—London Mining Journal.

Electric Pumps and Pumping.*

By A. W. K. PEIRCE.

An important feature of mining operations, of whatever nature, is the disposal of water met with in sinking and developing shafts and workings, and the distribution on the surface of the water required for the various requirements of the plant or process. On the gold mines of the Rand the latter feature is in general more prominent than the former, although there are some districts here where the handling of the underground water plays a very important part in the problem of gold winning. It is my purpose to speak only of water handling by means of pumps driven by electric motors, hoping that my remarks will bring to light much desirable information regarding other methods, with the result of obtaining fair comparisons of the various methods of transmitting and applying the power required for handling water. As the disposal of underground water is usually more difficult than surface distribution, I shall speak mainly of that. Let us first examine the conditions under which the water must be handled. In the first place, underground water as met with in shaft sinking and development appears in two ways, which differ considerably in degree, though not much in kind. One is the surface water, which is met with in the first 200 feet or so of shaft sinking. This water is mainly seepage from the local surface soil coming into the shaft through clay or soft rock seams. This seepage being from a comparatively local area, with little or no underground reservoir capacity, the flow of water varies with the season, being a minimum at about the end of the dry season, and maximum at or near the end of the wet.

At greater depths the water, while, of course, its ultimate source is similar to that of the surface water, is of steadier and usually greater flow, because of the greater area of country drained, and the liability of the existence of reservoirs, either surface or underground, in which the water is stored during the wet season, and which keep up the supply during the dry. Consequently, the flow of water does not exhibit much, if any, variation with the season. These reservoirs are not necessarily large cavities in the earth, or lakes on the surface. A seam of broken rock, or a series of clay or talcose seams in the rock, may hold a very considerable amount of water, and it is usually in cutting through such seams or fissures that the water is found. It is frequently the case that when these water-bearing seams are first cut into the flow of water is considerable, but after a few hours, days, or weeks, depending on the nature and source of the water supply, the flow may diminish considerably, or cease altogether.

Then, too, in some sections of the Rand the water-bearing rock is met with at intervals all the way down (I am speaking more particularly of vertical shafts) whereas in others the water all comes from one or two points only. All these and other features of the water supply make it difficult to attempt to deal with more than the very general features of mine pumping, but there are certain general characteristics of electric pumping that are universally applicable, and with these and a description of a few typical cases I will proceed.

Assume that a deep level company is to put down vertical shafts to a depth of 2000 or 3000 feet, and that the management has decided to use electric pumps, if any. Assume also that the quantity of water, for which pumping plant must be provided, has been decided.

The first questions that arise are:

1. What type of pump is to be used?
2. What system of electrical transmission?
3. What type of electrical apparatus?
4. What head shall the pumps be operated against?
5. What size of pump, and what capacity, shall be used?

I think there is no question as to the superiority of the three-throw or triplex type of pump, having the cranks following one another at angles of 120°, driven from motor by single reduction, machine-cut gears. As to whether the pumps should be of the horizontal or vertical type is largely a matter of design, and of the use to which the pump is to be put. I would rather have a well-designed vertical than a poorly-designed horizontal pump for any service, but it is my opinion that for heads of over about 300 feet or so a vertical pump cannot be made sufficiently stiff and heavy to stand the strain of the gearing and the thrust of the plungers as well as a horizontal pump, unless it costs more money.

In any type of valve, the area of the water passage through the valve varies directly as the diameter of the valve, while the total pressure on the valve varies as the square of the diameter. Furthermore, the area of the water passage around the edge of the

*Condensed from Transactions of the South African Society of Electrical Engineers.

valve need be no larger than that through the valve seat, but should be as large. From this it follows that the lift, which is limited by various factors, also limits the diameter of the valve. So long as the valves are of the automatic type, the total pressure on the valve or the lift must be kept low, or else the wear of the valves and seats will be excessive from the hammer of the valves; and as these two factors—total pressure and lift—are to an extent independent, it follows that for pumping against high heads, say, 1000 feet or more, only small valves can be successfully used, which renders it necessary to use a considerable number of valves for each plunger, if any considerable quantity of water is to be handled.

The Gold Belt in Tulare and Kern Counties, California.

TO THE EDITOR:—I want to recall a prediction I made in a communication nine years ago. At the instance of your office I took the contract of taking the census of mines in Kern and Tulare counties, and in passing over the uninhabited portion of Kern county I was led to say to the MINING AND SCIENTIFIC PRESS: "Here lies the coming El Dorado of California." The later discoveries at Red Rock, Goler, Garlock, Johannesburg and Randsburg—and in fact up to the Inyo line, have verified my predictions.

The great belt of schistose and calcareous formations which extends from Fresno Flat across Tulare county carries mostly silver ores and the baser metals until it reaches the Kern county line. The course of this belt is generally 25° to the east of south until reaching Kernville, when it divides, or, perhaps, more properly speaking, spreads. To the north of this point the belt is generally about two miles wide, with granite on both sides. At Kernville there is a change of 50° in the bearing of the west wall of this formation, and a line drawn from the Big Blue mine, above Kernville, to the Warrington, west of Havilah, on a bearing of 25° west of south for a distance of sixteen miles would almost exactly mark the contact running through this county. There are, however, about three miles where this line would follow the bed of Kern river. Those three miles lie between Isabella and Kernville, and it is below where Kern river covers this contact that all the placer gold has been mined which this stream has ever yielded. It is the southern eleven miles of this contact which has during the last year attracted attention. Much of the way it carries about 100 feet in width of low-grade, gold-bearing material, ranging from pure quartz to a porous, talcose matter, something like that contained in the blanket ledges at Mercur, Utah. This formation frequently carries a large quantity of small cubes which most miners are unable to classify. They are silver white, or perhaps more nearly tin white, from $\frac{1}{16}$ to $\frac{1}{32}$ of an inch in diameter, somewhat malleable, heavier than galena, and are believed to carry gold in chemical combination, something like sylvanite.

As I have said, this formation of calcite and slate spreads, and the main trend is to the east of south to Erskine creek, Kelso creek and Piute mountain, where it spreads directly east, and if the desert sand was removed it might be found to embrace nearly the whole region from Mojave to Randsburg and beyond.

Between this southern trend and the western contact, and west of Erskine creek, two mines have been opened which promise to rank with the foremost of this part of the State. The Russian Bear, at Glenn Olive, on East Bodfish creek, has yielded about $250,000 to five stamps during the last five summers. The vein is from 5 to 8 feet wide and increases in value with depth.

The second of these mines is on the Erskine creek ridge, two miles to the north of the former, and is just being opened up. In size and wealth it promises to surpass the mine at Glenn Olive.

The numerous stringer veins jutting into this contact from the southwest still afford employment to many poor men, who mine on their own hook and mill their high-grade rock at custom mills.

STEPHEN BARTON.

Isabella, Kern Co., Cal., July 17th, '99.

THE most economical mine to develop and operate is that which can be opened through an adit tunnel or a series of them, and of course where the tunnel runs in on the vein is an advantage over one which reaches the vein through a crosscut. Shaft sinking is always more expensive than tunneling and the necessity of handling water from shafts entails an additional expense. Still most of the mines which have developed the greatest permanency and paid the largest dividends are those which are opened through shafts. Some mines are extensively operated in their early history through tunnels which later are worked through shafts.

THE surface ground of several of the largest mines of Butte, Mont., were worked in the early history of the camp for glacer gold and proved very profitable. When the loose material had been removed the ore contained silver and further development was delayed for years.

Charcoal as a Precipitant of Gold from Auro-Cyanides.

By JOHN I. LOWLES, Inst. M. M.

In the district of Victoria this method is used to the almost total exclusion of any other, in many cases probably in imitation, rather than with any definite grounds for its superiority over the zinc process.

The methods are identical down to the extractor house which in a typical plant contains 189 tubs, each 2 feet 4 inches high, 2 feet 1 inch in diameter at the top and 1 foot 9 inches at the bottom. In the center of the bottom of each tub are two small wooden cleats, 4 inches apart, on which rests a glazed drain pipe, 4 inches in diameter, flanged end downwards. Center pipes and tubs are filled with charcoal, coarse for 6 inches from bottom and medium size to within 6 inches of top of center pipe, with about 3 inches outside and 5 inches inside the tub of coarse charcoal again. On the top of the charcoal, inside the tub and all round the pipe, is a wooden lid to keep the charcoal from floating and blocking the outlet pipe.

Another form of tub much used has no center pipe, but there is a false bottom of filter cloth, while on the top of the charcoal is a hinged lid with feed pipe let into it.

The preparation of the charcoal is important, impurities being prejudicial and wasteful. Fine stuff is objectionable, being a bad filtering medium and also passing through into the sumps. Heavy compact charcoal again is not so efficient as that which is light and porous, gold being deposited throughout the whole of light charcoal so that compact material offers less depositing surface and is moreover more difficult to incinerate. The charcoal is ground and sieved to three sizes: coarse, medium and fine, the latter being discarded. The other sizes are thrown into separate tanks of water, and only that which floats used.

The tubs in above works are arranged in two groups, the first of 144 filters, in 24 sets of six each, for strong solution; the second of 54, in 18 sets of three each, for alkaline wash (0.04% KCy) and weak solution.

The solution passes down the center pipe of the first tub in each set coming up on the outside and flowing over the lid through a 1 inch pipe to the next tub of the series, and so on, finally passing away to its own particular sump. The top filter catches most of the gold and when fairly charged is removed, each of the remaining five being moved up one step and a newly charged tub being placed in the sixth position. The filter removed is drained of some of its solution and emptied into a large box with a filter bottom where the rest of the solution is run off into the sump, leaving the auriferous charcoal ready for the furnace room. A tub occupies first position for about three days.

The efficiency of the precipitation is, of course, an important point. The strength of solution does not appear to affect the precipitation at all, the percentage extraction being uniformly high; the solution going out to the sumps in one establishment rarely showing more than 3½ grs. per ton (original value not stated), while 0.04% KCy solutions are successfully precipitated. The gold in the top filters is considerably purer than that caught in the lower ones and the author suggests that means might be taken to keep the contents of the top filters separate. Frequent tests show a steady diminution in the value of the gold, taking place downwards through a set till the bottom tub is nearly pure silver.

The exact action of the charcoal has never, as far as the writer knows, been experimentally demonstrated, but he thinks it may be due to the hydrogen and hydrocarbons remaining in the charcoal, the result being the formation of hydrocyanic acid and free gold. This HCy represents a certain amount of loss of active agent.

From the filter house the auriferous charcoal is conveyed to the furnace room where it is incinerated in four reverberatory furnaces, each 10 feet long. The ash is sieved through a 900-mesh trommel and the coarser residues returned to the furnace. The fine stuff or "ash" containing about 80% gold is then smelted.

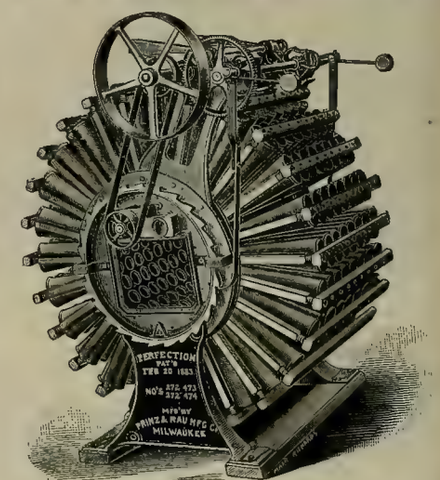
The author thinks it doubtful whether the process will supercede the zinc process, but points out the following advantages:

1. A high-class bullion is produced—one well known mine receives £4 per oz. for cyanide gold.

2. Percentage extraction is high regardless of strength of solution.

3. In spite of the large amount of auriferous charcoal to be handled the "waste" is easily got rid of by burning, and the ash is easily smelted without the necessity of treating with strong acids or careful oxidizing roasts (with some unavoidable loss).

One great disadvantage is the greater chances of loss through the immense bulk of stuff to be handled and the higher cost of the operation itself. The cost of charcoal precipitation (with charcoal at 9d. per 40 lbs.) works out at 4.29d. per oz. of gold. Zinc precipitation (with zinc at 4½d. per lb.) would cost 2.25d. per oz. of gold. Labor works out at 0.763d. per ton of the charcoal and 0.382d. per ton for zinc.



To recover the gold from the "ash" at these works costs 1s. per oz., bullion 900 fine, exclusive of labor, as against about 2d. for zinc slimes which would probably average not more than 800 fine.

There remains the question of increased outlay for plant and buildings, but these are not very serious. Considering the same works the 198 tubs cost £247 10s., zinc boxes would require but a small portion of this.

[Charcoal was at one time tried as a precipitant of gold in the chlorination process and has been recommended for the purpose by some operators and condemned by others. In 1893 Dr. W. D. Johnston of San Francisco, Cal., applied for letters patent on a method of abstracting gold and silver from their solutions in potassium cyanides, which contemplated the precipitation of gold from auro-cyanides by passing them through a series of charcoal filters.—ED.]

A Dust Collector.

Dust is a source of discomfort and disease in many mills. The device illustrated herewith is designed

PATENT DUST COLLECTOR.

to do away with such annoyance. This dust collector is made and sold by the Prinz & Rau Manufacturing Co., Milwaukee, Wis.

Quicksilver in Oceanica.

In New Zealand, as in Victoria, the discovery and working of cinnabar deposits has aroused no little attention. In Victoria the deposit which has given best indications of future value is located on Jamieson's creek, Gippsland. In New Zealand the ore is being worked on the Kaweranga creek at the Shortland end of the Thames gold field. Some of the ore, which has been exhibited in Auckland, is very rich in quicksilver, and has been valued at £50 per ton. A company is being formed to work the deposits, called the Thames Quicksilver Mines, Limited. The capital is £6000. One-third goes to the discoverers in paid-up shares. Mr. Rundall, an expert in mercury from Mexico, and Mr. Daw, general manager of the New Zealand Crown Mines, consider the property well worth prospecting. The markets for quicksilver will be New Zealand and Australia, and also China, which absorbs 15,000 flasks per annum. Quicksilver is largely a monopoly held by the Rothschilds, who own the Almaden mine in Spain, which has a history of over 2300 years. It is said that 1% of cinnabar will pay the working expenses, and a report from the Thames School of Mines shows that specimens of this ore selected by the director, B. F. Allen, ran from 0.3% to 27.5% of cinnabar. Other quicksilver producing countries are the United States (California), Mexico, Russia, Italy and Austria.

Experiment with Coarse Crushing.

Formerly fifteen days were occupied in the treating of the Dorotha Morton, B. C., ores by cyanide before the extraction was completed. This difficulty has been recently overcome. Mr. Lang, the Fairfield Co.'s manager, having discovered that, by crushing coarser and using a screen of thirty mesh instead of twenty mesh, as formerly, extraction is limited to seven days, and at the same time a higher percentage of values is recovered. The last month's operations show nearly 90% gold and an 80% silver extraction—a very material gain over previous returns.

The value of the output last month was $13,138, as against $9536 in April and $3363 in December last. The bullion returns for the six months aggregate $48,245. The cost of working, which includes mining, transportation, crushing and cyaniding, have been $6 per ton; but these costs, it is affirmed, will be considerably reduced when the mine is developed sufficiently to warrant an increase of the crushing and treating capacity.—Vancouver Mining Record.

Mining Summary.

ALASKA.

The Coast and Geodetic Survey has a report from G. R. Putnam, who is with a party at St. Michael, regarding the gold fields around Cape Nome. He says he cannot vouch for the accuracy of the reports from Cape Nome. It is certain new fields have been opened five to thirty miles back from the coast between Cape Nome and Cape Rodney. There are 2000 miners in that section, with their principal settlement at Anvil City, a new town not on any map except those of the transportation companies.

United States Consul McCook at Dawson says that reports from Alaska indicate that more gold will be found there than will ever come out of the Klondike. Typhoid has broken out six weeks earlier than in former years. Many people in Dawson are destitute.

ARIZONA.

Phœnix *Republican*: The Crowned King Co. have again started their mill in the Bradshaws. They have been shut down for a month for repairs. The mine has been running with a full force. The rich ore has spread through the vein. They have made a strike at the Big Bell mine, which has been worked and managed by R. Harrington. They have thirty men to work since they put in the new hoist, and are sinking and drifting. The rich ore is in the 300 level. The Star mine is owned by the Harringtons, who have a large force of men, and are drifting to cut the ledge at 1000 feet. ——E. M. Foltz, Supt. of the Place mine, will start up again. The Place M. Co. has the south extension of the Crowned King, and have rich ore. He has men working on the wire gold claim.

Kingman *Miner*: Dr. Hamilton of Los Angeles has bonded the Keystone mine from J. Uncapher. The Keystone is at Mineral Park.

Tombstone *Prospector*: P. D. Clark of Los Angeles has a bond on the Little Jessie property in Pearce.

Prescott *Courier*: Mr. Collins has bonded the Johnstone mine on Rich hill and has made Mr. Jones Supt. He has also bonded other mines in the same neighborhood.——Three hoisting plants are en route to Prescott. There are two hoists for Mr. Haggott—one a steam hoist for the Blue Bell Copper Co., the other a gasoline hoist for the Zonia Copper Co. The third hoist is for Mr. Button's mine near Minnehaha.——The projectors of the copper property on Whipsaw gulch, two miles from Briggs, which property was incorporated some time ago, have raised funds for development and prospect work and will erect a 40-ton smelter to work the ores. Contracts have been let to sink the shaft 250 feet. The mines carry copper and gold ore. ——It is reported that the Val Verde Copper Co., Ltd., has paid the P. & E. Railroad (Big Bug branch) $10,000 for tracks and spurs, and teams and men are grading for same to Agua Fria falls, the site of the proposed plant.—— ——The Baltimore capitalists who purchased the Buster group on Pine creek have purchased the Mohawk group and are negotiating for other mines in the neighborhood. They have sixty men at work and are putting up a quartz mill and a saw mill.

Jerome *Reporter*: The Spoke and Stonewall claims in Mescal gulch were sold in Boston to Burkes & McBride. Thirty-five thousand dollars have been deposited at Prescott and will be turned over as soon as certain conditions are complied with.——The Dewey, an undeveloped mining claim in the neighborhood of Stanton, has been sold to J. W. Dean of Boston for $5000.

Globe *Silver Belt*: The Copper Queen Co. of Bisbee is to increase its smelting capacity from 600 to 800 tons per day.

Arizona *Star*: At the new copper discovery not far from Davidson's canyon the bodies of ore continue at depth, as on the surface. H. Bushman is driving a tunnel which will crosscut the vein at a depth of 130 feet. At last accounts they were coming into the ore body.

Yuma *Sun*: The discovery of lead is reported to have been made in the Castle Dome mountains, twenty-two miles north of Gila City, on property belonging to M. Modesti and F. Avila. The property has been worked in a small way for the past four years and is developing into a large lead mine. Two shafts have been sunk—one 110 feet and the other 50 feet—with a tunnel connecting from the bottom of the 50-foot shaft. The ledge is 2 feet wide and is gradually increasing with depth. The ore is solid and runs 50% lead, with a small amount of silver. Returns from the two carloads recently shipped to the smelter at Pueblo show a profit of $2623.90.

CALIFORNIA.

Alameda.

Oakland *Enquirer*: The ledge of gold-bearing quartz uncovered back of Mountain View cemetery, in Hays canyon, is being developed. This ledge was located a year ago by W. W. Hooper, who, with W. W. Newcomb, J. G. Bruguiere and others, has developed the vein. The Bruguiere M. Co. has been organized and will work the claim.

Amador.

Jackson *Dispatch*: At the Spagnolia mine, near Clinton, the shaft is down 150 feet. It is expected to reach the ledge at 200 feet.——It is reported that the Hoffman-Field mine, south extension of the Argonaut property, at Jackson, will be opened by W. F. Detert as soon as a suit for partition to the Jackson quartz mine and adjoining placer claim is settled.——The matter of the construction of a mill at the Oneida mine, near Jackson, is to be taken under consideration.——The Central Eureka, where the recent strike was made, is negotiating to have a test made at the Zeila mill, at Jackson.——H. J. Lambert of Carbondale is to open new pottery works at that place. There is a bed of clay on this property that, after a series of experiments, is said to be a good quality of potters' clay.——The Potazuba, at Sutter creek, is sending 200 tons of ore from their mine to the Zeila mill at Jackson.

Butte.

Oroville *Mercury*: At the Gold Bank mine, near Forbestown, the upraise from the adit tunnel has been enlarged to a two-compartment shaft, which is now 1040 feet deep. Work is in progress on four levels. Power drills are employed in drifting, the smaller machines being operated in the stopes. Seventy-five men are employed. The 40-stamp mill on the property crushes 40,000 tons of ore per year, running constantly. The mine is equipped with a canvas plant and chlorination works, the ore in the Gold Bank ledge being heavily sulphuretted.

Calaveras.

The United Labor G. M. Co. has recently been incorporated at Angels, to work mines located west of Angels in Smith's Flat. The company has been organized on the lines of building and loan associations.

Prospect: The Shirley Queen mine, four miles from Copperopolis, owned by W. H. Oxendine, was bonded recently to E Germane and W. H. Gifford of Los Angeles, Cal., for two years, for $15,000. This property has been developed to a considerable extent. A mill from one of their mines on the desert is on the way to Copperopolis for this mine.

San Andreas *Citizen*: It is reported that negotiations are pending for the sale of the Ford mine.——D. C. Demarest, Mgr. Demarest mine, six miles south of San Andreas, reports work on this mine begun June 26th, '98. Preliminary work occupied till July 15th, when sinking began from the 100-foot level. The shaft was sunk in foot-wall slates, at an angle of 60°. The shaft has two compartments, 4x4½ feet, and is down 435 feet. Eighty tons of ore netted $550 in free gold; 220 tons yielded $1545; the concentrates saved on this lot had an assay value of $103 per ton. The stamp mill has been overhauled; the copper plates were resilvered; two concentrators were put in; a new 60 H. P. engine was installed, also a blower with independent engine. The cash receipts were $24,357.14.—— The affairs of the Fort Wayne Gold Producing Co., also known as the Marshall mine, are being readjusted. The employes have been paid, less the costs of the attachment suit. The mine is being retimbered in part and other repairs made. It is reported W. Knight will succeed J. F. Clapp as superintendent, and A. Schulte, the representative of the Indiana owners, will have charge of the office. ——J. C. Kemp Van Ee has filed a claim in the Stockton land office to the Royal Extension mine, at Hodson, in Salt Spring Valley. It will become a part of the group owned by the Royal Consolidated Mining Company.—— It is reported that the Royal Consolidated Co. will build a new mill of 100 stamps. There are forty stamps on this property.—— The Commodore mine is now the name for the old Flamm property, two miles north of San Andreas, operated by W. H. Clary, Jr., of Stockton. A steam hoist has been put up and sinking will be resumed.——At the Ellen Vannan gravel mine the owners have been investigating and changes are to be made. The Radamaker mill will be replaced by a 10-stamp gravel mill.——The Poorman mine is being opened up one and a half miles above Glencoe. Charles Guth is the foreman. He employs thirteen men.

Mokelumne Hill *Chronicle*: The Melba G. M. Co. of San Francisco has been incorporated to develop and operate the Melba mine, patented, southeast from the Gwin mine. It extends 3000 feet along the lode and is 800 feet wide. The rock is slate and quartz mineralized. Development consists of a tunnel 200 feet in length, crosscutting the ledge, and a shaft 50 feet sunk on the ledge. The lead is 3 to 6 feet wide. Daniel Grant will act as Supt.

Del Norte.

Work on the Myrtle Creek ledge, owned by Jenkins, Lewis and others, is to be resumed. When it is found possible to save the gold in the tailings from the arrastra the profits will be large, as the tailings assay $14 per ton.

Crescent City *Record*: Development work is being done at the Young's Valley copper ledge by a New York company. Thirty men are employed. There is considerable snow yet between there and Waldo.

Crescent City *Record*: T. B. Jones is making locations on upper Smith river. In a few weeks a dredger and gold-saving machine will be put to work in the bed of that stream.

El Dorado.

The county assessment of the Union mine has been raised from $12,500 to $100,000.

Placerville *Nugget*: Hayward & Lane, who recently bonded the Santa Clara quartz mine, Kelsey district, of J. McGraw & Co., are putting in a steam hoist and are making preparations for development.——A steam pumping plant is being installed at the Little Gem mine near Volcanoville.——A 50-foot shaft has been sunk on the Gem and a 2-foot ledge of high-grade ore exposed. Water was encountered near the bottom of the shaft. A pump has been put in and the work of sinking resumed.——Richardson & Klopfer have begun sinking a new shaft on the Alta Vista, Granite Hill district, west of the old shaft. ——Eighteen men are employed at the Darling mine near Georgetown, recently unwatered by the English company which purchased the property two years ago. Drifting is progressing on the 150-foot level, and it is said good ore is found.——The new mill at the McKeeney mine near Greenwood is completed.

Georgetown *Gazette*: The McKeeney mine, one mile north of Greenwood, will be ready to work soon, as the mill will be completed this week.——Collins & Sylvester have the contract for running a 150-foot drift and an upraise of 100 feet, which will tap the old shaft of the California Jack mine and the lode at a depth of 200 feet. Work will commence next week.

Fresno.

J. H. Hand has sold the Heskell copper mine, three miles from Pollasky, to H. B. Vergo for $25,000. Mr. Vergo represents an English syndicate, which owns the Copper King mine and other copper properties in Fresno county.

Kern.

Randsburg *Miner*: Big Butte has struck a good lead. It is reported to be 4 feet wide, 60 feet on the level, and runs $50 per ton.—— The Dyke G. M. & M. Co has been incorporated to work the Dyke mine, one and one-half miles southwest of Randsburg. The directors are J. C. Brown, M. P. Minor, W. C. Brown, C. F. Roberts and C. H. Belcher.

Inyo.

O. O. Howard Jr., Pres. Mt. Shasta Gold Mines, Ltd. has returned from the East where he organized and incorporated under the laws of Michigan, the Ratcliff Con. Gold Mines, Ltd. The home office of the company is at Battle Creek, Michigan, and general offices for the transaction of all business in the Mills Building, San Francisco, Cal. The company have a group of twelve mines in Pleasant canyon, Panamint mountains, in the South Park mining district, six miles from Ballarat. On the property is a 10-stamp mill and a 50-ton cyanide plant, with a tramway 4000 feet long from the mine to to mill. The mines are reported producing several thousand per month and employ twenty-five men. It is the purpose of the new owners to double the capacity of the plant, and to prosecute the development of the mines, which now show an ore body in places 30 feet in width, with no hanging wall exposed, and milling well in gold.

The Ratcliff Con. Gold Mines, Ltd , is a close corporation, the shares held by seven shareholders. The board of managers are O. O. Howard Jr., chairman, H. A. Ladd, Sec'y, both of San Francisco, Cal., and W. W. Durand of Battle Creek, Michigan, Treas. R. F. Harrison, one of the shareholders, has been appointed Supt. and is now in charge of the company's property.

Los Angeles.

E. Brough is developing his mine, the west extension of the Red Rover, five miles west of Acton. The Red Rover is being worked steadily.

Several prospectors are looking for the vein from which fragments of a dark colored, granulated copper ore came, found near Acton. It is rich in gold, but thus far no trace of the vein has been discovered.

Mariposa.

It is reported that the mill of the Merced Co. near Coulterville is to be hung up preparatory to the enlargement of its capacity by the introduction of twenty more stamps, making sixty in all. Meanwhile the Mary Harrison shaft will be sunk 500 feet deeper and an electrical plant installed.

The Mariposa Estate, covering 4387 acres of mineral territory in this county, is to be reopened. For thirty-five years it has lain idle; the mills have fallen into decay and many of the mine workings caved. The property has been owned for years by the Mariposa Mining & Commercial Co., composed of J. W. Mackay, J. P. and S. Jones, A. Hayward and the Hobart estate. Some months ago H. Smith, Jr., and H. C. Perkins bought a one-sixth interest and recently obtained an additional sixth from Mr. Mackay and additional interests from S. Jones. It is stated that the London Exploration Co. is not directly interested in this deal. A new Board of Directors of the Mariposa Mining & Commercial Co. has been elected as follows: T. Mein, Pres.; H. H. Taylor, Vice-Pres.; H. C. Perkins, Mr. Gorham; J. H. Mooser, Sec. Capt. Mein will have the management of the property.

The Pine Tree and Josephine workings are to be cleaned out and extended, dams are to be built in the Merced river and an investigation of the large property commenced.

The Princeton mine, which is only 600 feet deep, is credited with a production of $4,000,000, is nearly ten miles southeasterly from the Pine Tree and Josephine, which are near the Merced river.

Mono.

Bodie *Miner*: The Dunderberg mine has been bought by A. D. Sullivan, who will settle all obligations outstanding against the property. The mine is twelve miles south of Bridgeport, and is opened by a crosscut tunnel 700 feet long.

Napa.

The Napa Con. mine produces 600 flasks of quicksilver monthly.

Nevada.

The old Osborn Hill mine, near Grass Valley, is to be reopened by W. B. Burn, the recent purchaser. A new hoisting and pumping plant will be put in. Geo. W. Starr will be general manager.

Captain Thomas Mein and H. C. Perkins recently inspected the Union Hill mine, near Grass Valley. Both are interested with the London Exploration Co. in the property. They are figuring on other properties in Grass Valley district and at North Bloomfield.

In Grass Valley it is expected that the Kate Hayes quartz mine on Osborn hill be reopened within the next few weeks, and will be in charge of John Eddy, formerly of the Pennsylvania mine.

Tidings-Telegraph: A new 100 H. P. double cylinder hoisting plant has been ordered by the Pennsylvania M. Co. The hoist will be operated by steam, but may be changed to water or electricity. This machinery will permit of working the Pennsylvania to a depth of 3000 feet, and will hoist a load of three tons at the rate of 400 feet per minute.

Placer.

The Bald Mountain gravel mine, twenty miles east of Forest Hill, has been bonded in San Francisco. F. W. Venze is Supt. and fourteen men are employed. A new hoist will be put in. The company is said to have $15,000 for development work.

Plumas.

Twenty-five men are employed at the De-Long mine. The wing dam is being extended, preparatory to putting in the elevator.

Quincy *Independent*: N. S. Trowbridge is making preparations for working the Robinson quartz mine, in Granite Basin, and is putting up a shaft house and other buildings.

Riverside.

The Leon mine, fourteen miles southeast of Perris, is extensively developed and has exposed in the workings some fine ore, in which gold can be seen. The workings have exposed two ore shoots; and further development is being planned. There are two shafts on the property and levels are run, but the shafts have not been connected. They are 500 feet apart. The vein is unlike others in that region, being at the contact of mica schist and a porphyry dike. The vein varies in size greatly. No crosscutting has been done, but when work is recommenced a system of crosscuts will be run.

Nothwithstanding the heat of mid-summer on the desert there are a large number of men working and prospecting in that region this year and some of them are meeting with success.

The Reity & Sherman mill has been bought by Ellerman & St. Germain and moved to their Ivanhoe mine near Virginia Dale.

San Diego.

The Ranchita mine, near Banner, which was purchased last year by G. Borden of New York, has been shut down, the miners have been paid off, and two men have been employed to guard the property, it is reported, with instructions to allow no one to enter the mine. There were eighteen miners employed in the mine when the shut down took place. A 5-stamp mill had been added to the five already in place and all was in readiness to begin work with the new mill. A test was ordered and the machinery was started. Soon thereafter orders were issued to close the mill, shut down the mine and pay off the men. The owner gave no reason for shutting down. The miners were offered work in mines at Randsburg owned by Mr. Borden, and all took advantage of the offer and have gone to that camp.

Shasta.

It is reported that W. A. Clark of Montana is trying to secure copper property in this county. His expert, F. K. Wilson, has been on Still Water creek, eleven miles from Redding, examining land belonging to J. B. Rathbun. The property is covered by gossan which assays in copper and has never been developed. Sulphide was reached at 100 feet depth at Iron Mountain mine. At the Rathbun property it is reached at 35 feet.

J. T. & F. O. Jorden report the discovery of a gold deposit in the Mills-Rabbit mine at Merlan, two miles from Redding. The mine has paid the expenses of operation the past year. A few days ago the owners struck a ledge 8 to 12 inches wide, rich in gold. It is said a single nugget, 10 inches long and 6 inches wide, contains $300.

The Copper Plate M. & D. Co. has been incorporated. Sacramento is the company's chief place of business. The directors are J. F. Morgan, W. Laing, G. M. Hignett, S. A. Rice and E. S. Wachhorst. The capital stock is $30,000. The new company will operate in Shasta county properties.

Redding *Searchlight*: Pugh & Menzie, who have opened a property in the Clear Creek district, near the Mt. Shasta mine, are preparing to roast their ore. The mill recently put in place has been operation a week.

Redding *Free Press*: F. H. Dakin, Mgr., reports a new rich vein disclosed by an upraise from the No. 2 level in the Uncle Sam gold mines. Miners were cutting an upraise and struck a vein that was not known to exist. The vein is 4 feet wide, half of it being sulphurets and the other half pure white quartz. Cyanide experiments are now progressing with both dry and wet processes to ascertain which is the better for the refractory ores found in the mine. A 50-ton cyanide plant will be built.——The sale of the Bully Hill copper mines to Capt. J. R. De Lamar of New York for $200,000 is confirmed. The deed conveying the title in the five claims comprising what is termed the Bully Hill, at Copper City, was filed for record at the office of the County Recorder July 18.——The ore deposit in the Arps claims at Copper City has been tapped again by a drift run from a winze 25 feet from the floor of the 100-foot tunnel. Wm. Arps, is superintending the work. The ore is a partially oxidized sulphide. The percentage of copper is not usually high in the ore, but the precious metal values make the deposits valuable.——A rich body of ore has been found in the Cora Ethel mine, owned by J. M. Bassett, at Shasta. The ore is said to run $125 a ton.——It is reported that a smelter will be built on the section of land offered by the Uncle Sam Gold M. Co. at the mouth of Squaw creek, near the west bank of the Sacramento river.——The first purchase by J. R. De Lamar in the Pittsburg or Copper City district since the purchase of James Sallee's Bully Hill property is that of the adjoining placer and quartz mines of T. M. Popejoy and T. Jennings. The deeds have been executed and recorded transferring the Baxter claim and the South Killinger quartz claim for $5000, and the Popejoy and Squaw placer claims, three water ditches and the southwest quarter of section 9, township 31 north, range 4 west, for $3000.

Sierra.

Johnson, Byrne & Ewer of Downieville have prospected the gravel in the river bed, above Yore's toll bridge, and obtained results that were so satisfactory that they will work the ground. The tailings from the Webster and Byrne diggings, which were rich, were dumped here.

Siskiyou.

Redding *Searchlight*; W. A. Bantz, Gen. Mgr. Siskiyou G. & C. Co. of Boston, and G. E. Ward, engineer of the same, have been at

Mabel group of mines, one of their recent purchases, and report the Mabel ledge uncovered the full length of the claim, and other ledges are uncovered in many places. An eight-pound sample of what is said to be sylvanite ore from the Mabel ledge sent to Selby for a test yielded $300.

Yreka *Journal*: E. C. Green has been working a porphyry dyke on McAdams creek, near Deadwood, from which he has taken out fifty ounces.——The Greenhorn Blue Gravel miners have commenced sinking a new shaft.——Page & Co., who have an option on the Nurse place, near the mouth of Greenhorn creek, have commenced sinking a shaft to bedrock on the line of the Greenhorn blue gravel extension.——G. H. Souther, manager of the company intending to work Yreka creek, has called for bids on lumber needed.

Trinity.

Recently a visitor at the Sykes placer mine at Trinity Center found a nugget on top of a boulder where the force of the water had thrown it. It weighed $7, and is the second largest piece of gold ever found in this property.

Redding *Free Press*: Van Ness has uncovered a 4-foot vein of copper gold ore near Bragdon. Fowler & Co. are pushing things on the Van Ness bonded ledge, and have many sacks of ore on the dump. Their large double arrastra is nearly finished.——Rogers & Butler have some fine rock in their Ophir claim.

Tuolumne.

Work on the installation of new machinery at the Santa Ysabel mine has been hampered by the slowness of deliveries, caused by the congested condition of the iron and steel industry. The company is running twenty stamps and the date of the beginning of dividend payments depends upon how soon stamping with forty stamps will be begun.

It is reported that the lot of treasury stock recently offered in Boston by the Boston & Tuolumne G. M. Co. has nearly all been taken. The Supt. reports from the mine that the ore body continues to improve. Development work is being rushed and it is expected the 300 level will be reached by August 5th, '99.

The pocket mines of this county annually produce hundreds of thousands of dollars and give employment to a large number of men, many of whom are tributers.

The Jubilee M. Co, C. L. Benton, Sec'y, has six claims on the East Belt, fourteen miles from Sonora. On one of the claims, the Hazel Dell, a tunnel run 376 feet in 1854 has been extended by the present company to 478 feet, the width of the exposed vein averaging 4 feet. A drift on this vein has been extended with machine drill for 80 feet; assays show good value. The rock is free milling. The quartz carries sulphurets of iron, lead and copper. An open cut 30 feet long and 12 feet deep on the Esterbrook exposed a vein 2¼ feet in thickness. There is a shaft sunk and a crosscut tunnel run on the Jubilee claim and the same quality of ore found. Two small stamp mills and a two-drill air compressor plant from the Compressed Air Machinery Co. of San Francisco have been installed. There is a large quantity of ore on the dump. The company has free water and an abundance of timber W. B. Moore, the president of the company, is in charge of the work.

Jamestown *Magnet*: The Dreisam mill, at Arrastraville, has been started up again after a shut down.——South of the Tuolumne river the Longfellow mill, at Big Oat Flat, is running on ore from the 180-foot level.——At the Mt. Jefferson mine, at Groveland, an ore body has been developed on the 300 level.——Preparations are being made to ship another carload of rich smelting ore from the Vine Springs mine, near Columbia, to the Selby Works at Selby.——G. B. Breese is developing a new discovery on the hill above and southeast of the Densmore, near Columbia.——The Hyahpooh mine, near Columbia, is again a regular producer, several new strikes having been made there in the last four weeks.——Forty miners held a meeting at Confidence recently and organized a miners' union.——Andrews & Swett have bonded the John Royal mine, at the head of Experimental gulch, from C. Smith & Co. It was worked years ago, and a number of pockets were taken out. It also contains shoots of rich milling ore. No work has been done on it for thirty years.——The Stockton Gravel M. Co., operating the Philadelphia Diggings, near American Camp, on account of scant water supply, have about ceased operations. The season's run has been encouraging and the company will enlarge its ditch.——Lack of water caused a shut down at the Star mine, on Rose creek, July 15th, this property being partly supplied by water obtained from the Stockton Gravel Co.'s ditch.

Sonora *Independent*: Work has been resumed at the Slapjack mine, at Second Garotte, under the supervision of H. Argall, and gold-bearing quartz is being taken out. This property, with several other claims, has been incorporated under the name of Yosemite G. M. Co.

COLORADO.

The attempt to reopen the Globe smelter on the ten and twelve hour schedule has failed. The men demand an eight-hour day, but have pledged themselves to abide by the decision of the State Board of Arbitration as to hours of labor and wages.

The State Board of Arbitration concluded its investigation in Denver on the 26th inst. of the causes of the deadlock between the smelter managers and their workmen, in consequence of which the smelters that are in the trust have been idle since June 15th. The board has commenced taking testimony at Pueblo. The impression is gaining ground that the board's decision will be accepted by both sides to the controversy and that the smelters will resume operations next week. Managers J. B. Grant and Dennis Sheedy claimed that it was impossible to grant an eight-hour day and the increase of wages demanded by the men, as the increased expense would have to be placed upon the producers of ores, and would lead to the closing of many low-grade mines.

In '98 Colorado produced $3,000,000 worth of lead and $1,200,000 worth of copper.

CHAFFEE COUNTY.

It is reported a concentrating mill is to be built at the Cuba mine in Dewey district.

Granite *Pay Streak*: Machinery is being put into place on the Magenta mine. This is the inauguration of operations contemplated by the Magenta M. Co., under the superintendency of C. G. Barrick. The company has been reorganized.——A matte smelting plant is to be taken to Winfield in La Plata district.

CLEAR CREEK COUNTY.

Silver Plume *Standard*: Two machine drills are being operated in the Burleigh tunnel drifting and stoping on one of the veins of zinc ore, cut by the tunnel.——In the Bear creek section of Clear Creek and Jefferson counties some good finds of copper are reported.——The sale of the Gold Dirt and other properties at Empire, owned by F. L. Peck, is reported for $100,000. The purchasers are the Empress M. & T. Co.——Mgr. Begley of the Humphrey Spelter Co. is employing men on some properties across the range in the Montezuma district, in which large streaks of zinc ore are showing, which have heretofore been considered worthless.

EL PASO COUNTY.

The Elgin Leasing Co., operating on the extreme south end of the Republic, of the Mary McKinney Co., is making big profits. This month 115 tons of ore, of smelting grade, have been marketed, and there is every indication that by August 1st, '99, this tonnage will be doubled. The second half of the 115 tons is estimated to return six ounces to the ton. The ore is coming from the 300-foot level. The lease expires at the close of the year and will probably not be renewed. The management is making the most of its opportunity and is crowding down the shaft for another level. The work was started the first of the month.

From the smelter returns to the main office of the Jack Pot Co. it is learned that the treasury reserve has been increased by royalties from ore shipped by the Creston M. Co. during the week ending July 18th, '99, $2,377.77. This would indicate a net production of $9500 a week. The ore varied from low grade, worth $14 a ton, to $120 a ton. Mgr. Davenport reports the breast of the drift in the 400 level to be in fine ore.

GUNNISON COUNTY.

The Doctor mine employs thirty-two men and keeps nine four-horse teams hauling ore to the railroad. The ore is a lead carbonate running well in lead and about thirty ounces in silver.

The business portion of the town of Vulcan was destroyed by fire on the night of the 20th inst. Several lives were lost.

A. Plewis and D. C. Mason have sold their one-third interest in the chloride mine on the ridge between Ohio City and Pitkin to J. H. Sinclair for the chloride company for $10,000.

Gunnison *News*: G. W. Bartholomew is manager of the concentrating plant his company is erecting to treat the Keystone ore, soon to be completed. The mill will have a capacity of twenty-four tons in twenty-four hours, and five tons will be concentrated into one. There will be two grades of concentrates, the first silver-lead and the second gold, copper and iron.

Marble *Times*: Rich sulphide ores have been found in the 20-foot incline of the Fargo by Mgr. Moore. Mr. Moore concluded to unwater the incline and see what was in it. This was done by a siphon, and upon examination a small vein of lead and copper ore was found. Men were put to sinking, and with each shot the vein became wider and richer. The vein proper is 3 feet in width, and has a high grade of lead ore, intermixed with copper values. Immediately under the hanging wall is a streak of copper ore that will assay from 30% to 35%. Two shifts are working on the vein and six tons are already sacked for shipment.

Silver Lance: The past week men have been cleaning out the ice and dirt in the Eureka tunnel. The force will be increased. This mine is at an altitude above timber line.

LAKE COUNTY.

When it is considered that the metallic zinc contents of Colorado ores are in excess of any other mineral except iron, the growing importance of zinc mining in the State will be appreciated. The development of this industry has been retarded by the fact that the lead smelters charge a penalty for this metal, in most cases 50 cents a unit over 12%. Metallurgical science does not yet seem to have discovered a method of saving the zinc in the ordinary ores of the State. This, of course, is a loss of thousands of dollars to the State, and the mining and smelting men are evidently awakening to the fact that from an economic standpoint it is poor business.

At Leadville the Bimetallic and Arkansas Valley smelting plants have posted a new scale of wages to take effect immediately. The schedule is the same as the ten and twelve-hour systems in use before the adoption of the eight-hour law, but the rate of wages represents an increase of 16% over the old scale. The following is the scale, the rate being based on twelve hours' work: Furnacemen, new scale $3.50, old scale $3; tappers, new scale $3, old scale $2.50; pot pushers, new scale $2.75, old scale $2.50; general labor, ten hours, $2.

Boston capitalists, headed by J. W. Knowlton and F. C. Hitch, and known as the Boston Gold-Copper Smelting Co., have purchased the old Elgin smelter and ground, covering eighty acres, at Leadville. A 300-ton furnace to handle pyritic ores will be built. The company is operating a plant at Ward. There are great bodies of low-grade ore in this district, and the new plant will be of benefit.

Leadville *Miner*: K. Chisholm is in Leadville making arrangements to sell a lot of hessite ore to the Arkansas Valley plant from the new Klondike strike in the Little Alex at Bromley. Specimen assays indicate that the eight-ton shipment will run fifty ounces gold, fifty ounces silver and 14% copper.

Carbonate Chronicle: The Morning Star on Carbonate hill has been shipping 150 tons a day of iron ore, but during the past week production has fallen off. The territory is blocked out and turned over to lessees, who ship from twenty to thirty tons a day of iron, which is found in a zone 200 to 300 feet from the surface. The ground embraced in the Morning and Evening Star combination has never been explored below the plane of oxidation, so that what is in the gray porphyry and lime, as well as the Cambrian quartzite, is a problem. Some day the company may decide to do some diamond drilling in order to ascertain the existence of any mineralization. It seems to be a well-established fact that where the upper contacts are mineralized there is almost certain to be deep-seated ore bodies. It may be added that this is one of the strong arguments in favor of the M. A. W. enterprise. The ground in the new consolidation embraces the site of what were once rich mines. The millions which came from the Maid and Henriett, Adams and Wolftone, were found in the region of oxidation, but below this lies the zone of the sulphides.

PITKIN COUNTY.

Aspen *Tribune*: This week the Aspen Union Smelting Co., owners of the old Holden lixiviation plant, closed a five years' lease on the plant to E. R. Stark of Colorado Springs, S. C. Arnold and E. B. Green of Denver. The lessees have possession and have men at work on the flume and in the mill, making repairs. L. S. Smith, who conducted the negotiations, states that the new concern will be known as the Stark Milling Co.—a private company. E. R. Stark, who is at the head of the enterprise, is treasurer of the Raven G. M. Co. and director in both the Union and El Paso G. M. Cos. S. C. Arnold is a practical millman and will have charge of the mill. E. B. Green is a mining man and ore expert. He will buy ores and attend to the outside business. In the mill the old tables have been removed and ten new ones ordered. It is expected to have them running within three weeks with a force of twenty men.

SAN JUAN COUNTY.

Silverton *Standard*: A test run of 110 tons is being made from the Occidental mine through the Gold King mill.——The ore from the Irene will sample by the carload 180 to 200 ounces silver, $2 gold and 30% lead to the ton.——Supt. Riggs has let a 300-foot crosscut tunnel contract on the Maid of the Mist to Gerow & Vanderlip. The claim is above Gladstone, in the Red mountain belt.——The Hidden Treasure crosscut is in 975 feet.——On the Prodigal Son an 18-inch streak in the bottom averages sixty ounces silver and 12-100 gold.——On Galena mountain Briggs et al are driving their Turtle Dove tunnel at the rate of 1 foot a day. The tunnel is in 116 feet, with 30 feet to run to get under the ore shoot.——The Big Ten, in the same locality, has a 160-foot tunnel driven on the vein.——Work has been resumed on the Empire Con. M. Co.'s property. The crosscut tunnel, driven to intersect the Dora and other veins, is in 1030 feet. Several veins have been cut. Mgr. Kane is working eighteen men.——The first shipment of tungsten ore from Silverton, reported to be the first mined for the market in Colorado, will be made by Grabowsky & Schultz of the Everline mine on Cement creek.

SAN MIGUEL COUNTY.

Mining Investor: A contract has been let in Denver for sixty 1050-pound stamps, with all appliances, for the new addition to the Smuggler-Union mill near Telluride. The Smuggler-Union group recently passed under control of a Boston-Colorado company, supposed to be allied with the Calumet & Hecla Copper M. Co.

SUMMIT COUNTY.

Breckenridge *Journal*: I. P. Lambing & Son are working placer ground under lease in Illinois gulch, above the town limits of Breckenridge.——Work has commenced on the Carrie, in Swandyke district, under the management of T. A. Brown. A small force of men will be employed, as the work for some time will be development. The property has been shut down for a year and the men found the tunnel full of ice. This has been removed and drifting commenced. There are several patented claims in the group, which, with a stamp mill, is owned by the Carrie G. M. & M. Co. of Pennsylvania.——A contract has been let to J. Gough for sinking a 50-foot shaft on the Ground Hog lode, a Cucumber gulch property owned by D. W. Fall and others. This mine, with the Hazel group, is under bond and lease to New York capitalists. Two years ago the Ground Hog was worked under lease and at a depth of 50 feet the vein was cut, from which a car of ore netted $550. A cave occurred in the drift, which, together with the large amount of water, shut the leasers out, who did not feel disposed to go to the expense of putting in machinery with the uncertainty of getting the lease extended.——The new Pennsylvania mill was started a few days ago.——The Humphrey spelter people are working thirty men on the Silver King, shipping the product to Upland, Indiana. Four cars per week are going from this property.—— Considerable new work is being done in the vicinity of Rathbone and several old properties are resuming operations.

TELLER COUNTY.

At Colorado Springs it is asserted that many of the larger mines in the Cripple Creek district are making five-year contracts with the Guggenheim's smelter at Pueblo, Colo., for the treatment of their ores. An agreement as to charges is reported having been made between the Guggenheims and the American Smelting & Refining Co., but this agreement does not divide territory or business. The controversy between American Smelting Co. and its employes over the eight-hour law has given the Guggenheims an opportunity to secure a large amount of the Cripple Creek business. In order to secure a continuance of the work which would warrant large additions to the Guggenheim's plant the mine owners are compelled to enter into five-year contracts. Plans now in existence call for a doubling of the Guggenheim's plant at Pueblo, Colo.

Cripple Creek *Times*: There is a movement to establish a concentrating plant in Cripple Creek. When the smelter strike was inaugurated the fact was apparent that the product of the camp could have been handled without inconvenience had the tonnage been less. Concentration was suggested, and the matter has taken definite form. A private company has begun a series of tests of Cripple Creek ores for the purpose of adaptability to concentration.——The owners of several claims on Carbonate hill have been endeavoring to consolidate their properties into one concern. At present there is little development being done on any of the claims, and if the company is formed enough treasury stock will be disposed of to work the ground in a systematic manner.—— Extensive trenching is being done by the owners of the Little Joe on the north side of Bull hill, in the hope of finding the extension of the Pinnacle vein.——A 12 H. P. gasoline engine is being installed on the lower shaft of the Morning Star.

Victor *Record*: Preparations are being made to erect an electric hoist at the Plymouth Con. Co.'s mine, northeast of this city.——The Gold Coin mine, located in the town of Victor, it is stated has sufficient ore in sight to maintain an output of 100 tons a day for three years without sinking or driving any new levels. Recently the vein was cut in the sixth and seventh levels. In the sixth the vein was encountered 135 feet from the shaft, while at the seventh the crosscut had to be driven 10 feet farther. The vein is stronger and more clearly defined than in the upper workings, but carries the same values. In appearance the ore is a dark blue quartz colored by fluorite. The mine is yet as dry as the driest in camp. The vein is about 40 feet between walls. The output has been curtailed to eighty-five tons daily, due to a limited ore market. With the opening of the two new levels and the new mill running, the output of the Gold Coin will only be limited by the capacity of its hoisting plant.

IDAHO.

(Special Correspondence).—Some time ago the large holdings of the Florida Mountain M. Co., belonging to Col. W. H. Dewey and others, were consolidated with those of the Trade Dollar M. & M. Co., and the result is the Trade Dollar Con., which remains under the management of James Hutchinson. These holdings cover a strip across Florida mountain from the Silver City side to the opposite side at the town of Dewey. At the latter place is a 20-stamp mill, with concentrators, in good condition, which is included in the consolidation. The newest project is the driving of a transportation and drainage tunnel from the base of the mountain, at Dewey, through the mountain, coming out at a point near the old Trade Dollar mill. Its length will be about 12,000 feet. It will be connected at various points with the Trade Dollar workings. This work is now in progress.

The Black Jack, on the western slope of Florida mountain, which belongs to the Idaho & Pittsburg M. & M. Co., has been closed down since April 18th, '99. The reason for this was the flooding of the stopes and drifts in the deeper workings. In this property the ore body is reached by a 2100-foot crosscut tunnel, 1200 feet vertically from the surface. From this tunnel level a shaft sinks on the hanging wall to a depth of 220 feet, from which point the drifting and stoping has been done. Here is where the surplus water comes in. From Supt. Frederic Irwin I learn that the property remains idle pending the solution of the surplus water question, the present pumping facilities of the property not being ample. It is locally reported in Silver City and DeLamar mining circles that negotiations are in progress looking to a further consolidation which will bring the Black Jack group into the Trade Dollar combination. The Black Jack is a large producer and a money maker and there should be no hesitation about putting in any pumping plant found necessary; but the inactivity since last April possibly can be explained by the consolidation proposition. The seeming tardiness in providing the requisite pumping facilities is accounted for by the projection of the Florida mountain tunnel on the part of the Trade Dollar Co., which cuts far below all Black Jack workings and which will drain the latter as well as other sections of the mountain.

The Boise, Nampa & Owyhee Railroad Co. are extending their line from Guffey, on the Snake river, to Reynolds creek, a distance of twelve miles, which will reduce the stage trip to Silver City and DeLamar. The Idaho & Northern Railroad Co., comprising the same people as the B. N. & O., are taking steps to build a line from Boise to Horseshoe Bend, fifty-five miles, which will tap a heavy timber belt and go within twelve miles of Quartzburg. Col. W. H. Dewey is at the head of these enterprises. WASCOTT.

Silver City, Idaho, July 20th, '99.

(Special Correspondence).—The De Lamar mine is working with its usual force and is milling 180 tons of ore per day at the cyanide plant. The coarser tailings are carried back, recrushed and submitted to a second treatment. The mineral zone, trending in an easterly and westerly direction, which carries the various parallel ledges of ore, is opened on this property by a system of crosscut tunnels, driven into the mountain at points 1500 to 2000 feet above the bed of Jordan creek, on which the mill is located. A rapidly operated rail tramway conveys the ore from the vari-

ous tunnels to the mill. Not 100 feet above the mill a new tunnel has been started, to be driven to the ore bodies, which, it is calculated, will be reached at 3200 feet. This will open the veins to an unusual vertical depth. A study of the vein structure here and the changing characteristics of the ore is one of interest. Much of the ore is a porous, decomposed quartz and porphyry, with streaks of talc and clay, and with good values in common-looking material.

In earlier days, when high-grade De Lamar ores were milled by stamps and plates, the tailings were passed down the stream and dumped on a bar, where to-day something like 150,000 tons are to be seen. The De Lamar Co. have completed a 200-ton cyanide plant to treat these tailings, which by tests are known to contain good values. The plant will be operating in a few days.

John Scales is operating a pan, settler and amalgamation mill on a portion of the tailings, paying a royalty from the proceeds.

W. H Townsend is running a similar mill farther down the stream, it is stated, at a profit. WASCOTT.

De Lamar, Idaho, July 21st, '99.

(Special Correspondence). — War Eagle mountain, on the east side of which is Silver City, was the scene of activity and large production in early days. On this mountain are the Poorman, Cumberland, Oro Fino, Ida Elmore, Golden Chariot, Minnesota and Mahogany. Just now little is doing in that locality, though the Cumberland, recently sold, is preparing to start up. It is claimed all these are on one great lode, and the old workings are through shafts, many of which are filled with water. A drainage tunnel, cutting below the old workings from the east side, has been suggested as a project that would unwater all the properties on the mountain. An effort is said to be making to harmonize all interests with such an enterprise as the object. Every vein, lead and spur of the lode mentioned is said to have produced good values. WASCOTT.

Dewey, Idaho, July 21st, '99.

MICHIGAN.

It is reported that the silver mine on Silver Islet in Lake Superior is to be reopened. Silver Islet is naturally a small rock 40x70 feet, and rising a few feet above the waters of the lake. Cribs and coffer dams were constructed about it and two acres of land built in this manner years ago. The property was equipped with machinery and the mine successfully worked to a depth of several hundred feet. The product of the mine was largely in native silver. A series of heavy storms destroyed a large part of the breakwater and coffer dams. The mines were flooded and have now been idle for years.

The inability of Isle Royale Co. to contract for mill machinery at anything like a reasonable price, as well as impossibility to secure it within a year, is said to be the reason why a stamp mill is not in course of construction. A four-head stamp mill at to-day's prices for steel and machinery would cost nearly half a million dollars without any guarantee as to when machinery would be delivered.

Boston *Financial News*: What is claimed to be the greatest feat in the world's history of mining was brought to a successful conclusion at Houghton July 20, when the forces rising and sinking at the new Quincy shaft No. 7 met a short distance below the 13th level, thus extending the shaft from the surface to a depth of 4000 feet in little more than eighteen months, thus eclipsing all records in the matter of fast work. The shaft was commenced 4000 feet below the surface on Jan. 1, 1898, and five months later sinking began at the surface. The start was made on the line of the shaft in the south levels of No. 4 shaft. No. 7 shaft curves toward the bottom to conform with dip of lode. The undertaking and its successful conclusion is due to Chief Engineer J. L. Harris, who was lately made assistant mine superintendent. No. 7 shaft will be timbered to the bottom within six months. The hoist and combined shaft and rock house will be ready six months hence, when the new mill will also be ready, and then No. 7 shaft will be able to supply 1000 tons of rock every twenty-four hours.

MISSOURI.

The American Zinc, Lead & Smelting Co. has bought the Richland mine, near Carterville, for $150,000.

MONTANA.

Anaconda *Standard*: The Alice Mining Co. at Butte is working its usual force. The total is about 100 men, including leasers and men on wages. The product from the mill is silver bullion, carrying gold in the proportion of 3 ounces gold to 1000 ounces in silver. Aside from the ore milled by the company they produce considerable base ore, which is shipped and sold to the smelters. The company is doing prospecting work in the Alice and Blue Wing mines. This is the only silver mine in the district that is now productive.

NEVADA.

The United States Copper & Smelting Co. has been incorporated under the laws of Nevada, with a capital stock of $2,500,000, to operate at Alpha, Eureka county.

At the recent annual meeting of the Dexter M. Co. of Tuscarora a new board of directors and officers were elected, composed of J. Dern, Pres.; J. S. Lakin, Vice-Pres.; S. B Milner, E. O. Lee and H. C. Southworth; G. E. Airis, Sec'y and Treas. During the past fiscal year the Dexter mine produced 19,994 tons of ore, which yielded gold bullion and auro-cyanides to the value of $155,347.31. Improvements costing $64,969.04 were made. Recently a vein of ore was struck in an upraise above the 250 level that gave average assays of $379.75 per ton, carrying a large amount of free gold.

A belt of copper croppings has been discovered on the northern slope of the divide between the Carson and Truckee river valleys, a short distance below the summit of Arrowhead peak.

At the De Lamar Works, in eastern Nevada, and at the April Fool mine, work is progressing as usual. It is reported that the option on the April Fool group will be taken up August 1st.

W. S. Brown, Gen. Mgr. North Mountain M. Co. on Cherry Creek, has commenced at the 600 level, where the workings will be cleaned out and preparations made for the further opening of the vein. The ores show an average value of $9 per ton in silver and gold. The cyanide process will be employed.

C. L. Taylor and J. M. Fulton of Reno have bought from S. Hunt, O. Bennett and S. D. Thacker their antimony mine, there being reported 10,000 tons of ore in sight. The mine is in Humboldt county, seventy miles north of Winnemucca.

The Mayflower, Great Eastern and other mines in Bristol district, which were once worked for silver and lead, are now being explored for copper ore and making shipments.

The Jackson Creek district copper mines in Humboldt county, seventy-five miles northwest of Winnemucca, are said to be located on a vein showing a width of 150 feet across at places in the Jackson Creek range.

NEW MEXICO.

Silver City *Enterprise*: The Pinos Altos G. M. Co. is building a pipe line from the Gebhart George cienega to Pinos Altos, five miles in length. The Gillett shaft on the Pacific vein is down 700 feet. A level will be run at 700 feet and the shaft continued to 1000 feet, with levels at intervals of 100 feet.——It is reported that the Little Fannie mine and mill at Mogollon will be put in operation.——At the Last Chance mine, E. Craig, Supt., ten stamps are running and regular bullion shipments are made. A bar of gold and silver bullion weighing 110 pounds was shipped last week. The bullion contains equal values in gold and silver.——At Hanover, Gilchrist & Dawson are shipping ten tons of copper-iron ore daily from the Thayer mine.——A carload of copper-iron ore was shipped from the Hanover No. 2 last week.——J. Schlosser is working on a body of copper ore on the Humboldt mine, which shows 800 feet. The ore runs from 8% to 20% copper.——The Anson S. is being pumped out and repairing the shaft is in progress. W. E. Clark, Supt.——The old shaft on the Hanover mine is being pumped out and the old workings drained. Two new shafts have been sunk, one 75 feet and the other 65 feet. Drifts have been started to connect with the ore bodies in the old workings.

OREGON.

Sumpter is to have a smelter which will be built by the Union Smelting & Manufacturing Co. of St. Louis. The name of the Sumpter company is the Union Smelting & Sampling Works, of which P. R. Bishop, W. H. Gleason and T. McEwen were the incorporators. The first meeting of stockholders and election of officers were held Saturday, July 22, in Sumpter.

Spokane *Chronicle*: At the Red Boy mine a mill of twenty stamps has been built, and arrangements are being made to increase its capacity to forty stamps. It is reported that $20 and $30 a ton is saved on the plates in addition to the concentrates. It is worked through a crosscut tunnel, which cuts the three veins running through the property. The Golden Monarch lead ranges between 10 and 15 feet in width, was the first cut at 500 feet, and at the same depth from the surface the Red Boy ledge was cut. This lead is 6 feet wide and carries rich ore. The tunnel is being continued to cut the Blaine vein, which is the largest. It will be reached in 300 feet. Drifting is in progress on both of the ledges cut.

SOUTH DAKOTA.

Deadwood *Pioneer-Times*: A large amount of wolframite is being shipped from the Black Hills. Three outfits are making these shipments and getting from $150 to $300 a ton for their product. All of this ore is sold through agents representing foreign firms, most of the ore going to Germany, where it is used in the manufacture of fine cutlery. Some of those who have made shipments of this ore are the owners of the Two Stike of Yellow creek, the Durango of Lead City and the Harrison mine, near the Durango. The Harrison mine has shipped twenty tons, the owners getting from $150 to $200 a ton. One thousand dollars was paid to the owners of the mine before the first shipment left the dump.

UTAH.

Pres. Coram reports development work of the Bingham mine to be satisfactory, finding all drifts and tunnels in ore, averaging 10% copper and $5 to $6 per ton in gold. The adit tunnel will tap the vein several hundred feet below the present workings. The directors will be asked to consider the advisability of erecting a new smelting plant.

A new shaft is to be sunk on the Massachusetts at Park City. Engineers have been making surveys with this object in view.

Deseret *News*: Copper ore has been found on the mountains east of Centerville, between Salt Lake and Ogden, assays of which give 15% copper.

Salt Lake *Tribune*: With 3000 tons of milling ore in the bins and on the dump, the plant on the Last Chance at Bingham will be started up again next month. Morris R. Hunt is manager of the property.——In the property of the Rich-Cache M. Co., at the head of which are L. R. Martineau and F. Turner, in the main workings is exposed 7 feet of ore, some of which shows native copper, while, it is said, there is enough silver with it to pay the cost of extraction and treatment. The group is located on the line between Cache and Rich counties, and the camp is a new one.

Salt Lake *Tribune*: Supt. Hood of the Silver Shield at Bingham reports that at a depth of 35 feet in a new shaft sunk from the tunnel level the vein has been broken into and uncovered a body of high-grade galena, the extent of which has not been determined, owing to the influx of water that followed. He has eleven men working on ores that are exposed in drifts off the tunnel level.——A Denver mining man who has been in the mining section east of Ferron pronounces the ore from claims owned by Huntington parties as bearing tin.

Tribune: All the alterations having been completed, the Highland Boy smelter has been turned over to the Utah Con. M. Co. by Kiepetko & Fischer, who superintended its construction. Mining men estimate that the cost of the plant has been $300,000.——The first consignment of bullion by the present owners of the Dixie group near St. George has been settled for. The bars contained 88.2% copper and a small amount of silver.——The pumps installed in the Independence shaft on the properties of the Tesora M. Co. at Tintic are at work, and breaking of ground after an interval of many years has been resumed. The ore shows 13% copper, fifteen ounces silver and $3 in gold per ton. The shaft, which is an incline, is at a depth of 225 feet. It was at that depth that water was first encountered.

WYOMING.

Grand Encampment *Herald*: At the Boyce discovery, the Eureka, the shaft is down 6 feet and the mineralized vein is 4 feet in width. One-half of the vein is solid ore assaying copper 22%. A carload will be sent to the smelters. The Eureka is three and one-half miles south of Grand Encampment——The Anchor M. Co., with a capital stock of $250,000, has been incorporated by A. H. Rehkopf, H. Crookham, F. S. Aldrich, W. G. Owens, A. E. Hollingsworth, L. G. Everist, T. R. Smith, of Des Moines, Iowa. The company will operate at Grand Encampment.

FOREIGN.

BRITISH COLUMBIA.

The Government has decided to establish an assay office at Vancouver. The agitation which has resulted in this action was caused by the bankers and others who objected to paying the fees asked by the United States Government.

MEXICO.

(Special Correspondence).—Reports from the Inguaran copper mining district, in Michocan, indicate that a railroad will be built from the mines to Zehuatenejo, on the Pacific coast, in which event San Francisco will be the basis of operations of the French syndicate that owns the mines and the railroad concession. The properties of the syndicate cover a territory which contains numerous veins of copper ore. The mines have been worked for two centuries, first by the Spaniards and later by the Mexicans. Prior to a year ago all work was done by hand. A little over a year ago Mr. Phillips, an American, was placed in charge. Air compressors and drills were put in, and on Dec. 20th the plant was put in operation. Five tunnels are being driven and considerable outside work is being done by hand. Two hundred men are employed. Other people are prospecting in the same neighborhood, as there are indications of copper on three sides of the syndicate's properties.

The new Tavichi district, a day's ride from the city of Oaxaca, is attracting attention. The La Natividad, owned by Rickerts, Grandison, Trinker and others, has just ordered a 10-stamp mill. Arrangements have been completed by which F. B. Morse, associated with City of Mexico capitalists, will erect a stamp mill in that district.

In the Tlacolula district of Oaxaca an English company, under the management of F. McCann of the City of Mexico, will erect a 20-stamp mill for the Oest mines, which have recently been purchased.

Mexico, July 22nd, '99.

It is said the mines at Alamo, Lower California, are doing well. A $5000 gold brick was recently shipped from the Viznaga mine at that camp.

SOUTH AFRICA.

At Glynn's Lydenburg the output for May was as follows: Milled, 2130 tons, yielding 810 ounces fine gold; cyanided, 1380 tons, yielding 522 ounces fine gold; slimes—April 731 tons, May 708 tons, yielding 441 ounces fine gold; total, 1773 ounces fine gold. Total value of output, £7925.

Commercial Paragraphs.

THE *Australian Trading World* of the 8th ult. notices the opening of the Western Australian section of the Greater Britain Mining Exhibition, under the auspices of the West Australian Chamber of Mines, and speaks of the Wilfley ore concentrating table. The *World* says: "The accuracy and the speed with which the Wilfley table does its work is truly wonderful, and it seems to require only the attention of an ordinarily intelligent non-expert; even a sharp boy could run it. The Wilfley Ore Concentrator Syndicate, Ltd., 32 Old Jewry, E. C., are the owners of the patent (excepting for America, whence it originally hails), and an enormous demand for this table may be expected from Western Australia, New South Wales, Victoria, Tasmania and New Zealand, where it should be the means of giving life to a great many low-grade mines that are at present unable to work their poor-grade stuff at a profit with old-fashioned machinery."

Obituary.

LLOYD TEVIS, a California '49er and prominent miner, died in San Francisco on the 24th, aged 75. The Anaconda, Mont., copper property, the Homestake mine, South Dakota, and the Ontario, Utah, were among the large mining properties in which he was interested. About two months ago he was credited with having received $8,000,000 for his share of the Anaconda property, then sold to the Rockefeller syndicate.

Industrial Notes.

—Seattle, Wash., is to have a government assay office.

—There is a general advance of $2 per M. feet on lumber.

—Several suffering miners are stranded at St. Michaels, Alaska.

—A branch line of the Sierra Railroad is to be built from Jamestown to Angels, Cal.

—Skaguay, Alaska, and Dawson, N. W. T., will be connected by telegraph Oct. 1st, '99.

—The Phœnix, Arizona, street railway is to be sold for failure to pay interest on its bonds.

—Government engineers have completed the survey for the new $20,000 reservoir near Florence, A. T.

—Moran Bros. are putting in a big lot of shipbuilding machinery in their Seattle, Wash., establishment.

—War revenue stamps to the value of $3160 were affixed to a deed in Oakland, Cal., this week, transferring the property of the Oakland Water Co. to the Contra Costa Water Co.

—The Occidental Smelting Co. has bought the Kirkland, Wash., townsite, near Seattle, and is locally credited with immediate intent to "build and operate a large smelting plant."

—The Southern Pacific Co. has increased its capital stock from $150,000,000 to $200,000,000, pending the reorganization of the Central Pacific Co., and its consolidation with the S. P. Co.

—The building of the Southeastern Mexican railway from a point on the National Tehuantepec road to the Guatemalan border is assured. The line will pass through the State of Yucatan.

—The Boston Gold-Copper Smelting Co., W. R. Duvall, Mgr., has bought an 80-acre site at Leadville, Colo., and will put in a 300-ton furnace. The Loeder pyritic reduction system will be employed.

—Prof. Le Conte, head of the geological department in the University of Cal., thinks that there is no connection between the recent volcanic eruption in Hawaii and the southern California earthquakes.

—Labor on railroad work and in harvesting crops, etc., is still reported very scarce in California. The Southern Pacific Co. say that their construction work is delayed because of inability to get laborers.

—The Hawaiian Islands are U. S. territory. The Philippine Islands are not. A sealed letter can be sent from the U. S. to the Philippine Islands for 2 cents; the same missive to the Hawaiian Islands costs 5 cents.

—The seventy-five miles of grading for the Wyoming Southern Railroad, from Fort Steele, Wyo., to the copper deposits in northern Colorado is expected to be supplemented by track laying in September, and later the road is to be continued through to Salt Lake, to connect there with the Short Line now being built to Los Angeles, Cal.

—The California State Fair at Sacramento, Cal., will be from Sept. 4th to Sept. 16th, inclusive, and is worth attention. Secretary Shields and those connected with it are sparing no effort to make it a success. The various departments will be of interest to all visitors. In the two weeks' racing $40,000 will be competed for, the mechanical display will be of unusual merit, and the daily celebrations by various organizations will be a feature that can not fail to be of interest to all.

—Consul Dudley, of Vancouver, B. C., writes: "The Government of this province has decided to establish an assay office in this city, and has also made arrangements with the Victoria Board of Trade and bankers there for the assaying of gold at the Government assay office, which has heretofore merely made assays for the benefit of the Department of Mines and not for private individuals. The agitation which has resulted in this action was caused by the bankers and others who objected to paying the fees asked by the United States Government. The requirement of a consular fee and an entry fee were regarded as hardships."

—James J. Hill, president of the Great Northern Ry., says that he sent 16,000 track laborers out in the past twelve months, and yet has had not more than 2500 men at work at any one time, the conclusion being that the most of them find work that suits them better in other lines. West of the Dakotas he employs more Japs than men of any other nationality, not from choice, but because he was obliged to. He says: "Every healthy man who is idle in the United States to-day is so from choice. I do not say that every carpenter can get carpenter work to do, or that every plumber can find a job at his trade, but if he will take what he can get every idle man in the country can go to work as soon as he is ready to. At this moment there are jobs ranging in pay from $1.25 to $3 and $4 a day for 100,000 men in the Northwest."

—The California State Board of Trade asks the MINING AND SCIENTIFIC PRESS to say that it wants a full line of minerals—gold ores, silver ores, quicksilver ores, copper ores, iron ores, tin ores, auriferous gravel, asbestos, mineral paints, onyx, marble, granite, limestone, pottery clays, asphalt, bitumen or any other mineral product of commercial value—and wants to be put in communication with parties who can furnish creditable samples of any of the above. Samples of each of these products are desired by the State Board of Trade, first to replenish its permanent exhibit, and, secondly, for a display of California products that it is helping to prepare for the Paris Exposition. If parties who have any of these articles will notify the State Board of Trade, an order will be placed with them at once for such amounts as may be required. All articles will be paid for by the State Board of Trade, also the cost of packing and expressage to their headquarters, Union Ferry Bldg., San Francisco.

Personal.

SUPT. FRANKLIN LEONARD of the Sutro Tunnel Co. is in New York City.

D. B. HUNTLEY of the DeLamar, Idaho, Co., is visiting the Buffalo Hump country.

CAPT. DE LAMAR and John Hays Hammond are expected in California next week.

R. K. COLCORD has been appointed assayer in charge of the Carson, Nevada, assay office.

JOS. MCGILLIVRAY arrived in London on the 21st inst. in connection with some Klondike mining property.

WM. RUSSELL is chief chemist for the Gold & Silver Extraction Co. of America, Ltd., at their Denver, Colo., office.

PHILIP DEIDESHEIMER of San Francisco and W. H. Lewellyn of New York are examining copper properties at Waldo, Or.

THOS. O'BRIEN, owner of two Dawson, N. W. T., papers, and a pioneer there, is in San Francisco en route to Ottawa.

H. A. COOK, Supt. of the Cowboy mine in Shasta county, Cal., has been a visitor in San Francisco. He has returned to the mine.

GEO. W. PARSONS of Los Angeles, Cal., is in San Francisco on business connected with the Leon mine, twelve miles south of Perris, Cal.

W. A. HOLMES, a mining man, who for several months past has made headquarters at Sonora, Cal., has gone to Siskiyou county, Cal.

PRES. MOHLER of the Oregon Ry. & Navigation Co. resigns to take the presidency of the Chesapeake & Ohio R. R., at an annual salary of $35,000.

PROF. G. P. GRIMSLEY of Washington College, where he is professor of geology, is making geological examinations in Nevada county, Cal.

J. L. SWANNEY of Cripple Creek, Colo., has returned to that place from Junction Bar, Idaho, where he has been in the interest of the Scottish-American Development Co.

F. H. NEWELL, chief of the hydrographic division of the U. S. Geological Survey, is in San Diego, Cal. He is on a tour of inspection of water-storage reservoirs throughout the country.

ALFRED BUTTEMER, who for four years has been superintendent of the mines of the Gresham Gold Exploring Syndicate of London, at Coolgardie, Western Australia, has returned to San Diego, Cal.

R. S. MOORE and T. J. Barbour of the engineer staff of the Risdon Iron & Locomotive Works, San Francisco, are on the Comstock inspecting the hydraulic pumping plant in the C. & C. shaft, while No. 2 elevator is being rearranged.

R. H. POSTLETHWAITE of San Francisco left for Breckenridge, Colo., on the 25th inst. to install a third dredger in the placer mines at that place for the North American Gold Dredging Co. Two of these dredgers were put in last year by the Risdon Iron Works of San Francisco.

CONGRESSMAN BELL of Colorado and colleagues, constituting a congressional committee of inquiry, are this week investigating labor troubles in the Cœur d'Alenes, Idaho; they go thence to Butte, Montana, and Salt Lake City, Utah, there to inquire into smelter conditions, etc.

A. A. WATKINS, A. Carrigan, S. J. Hendy, J. Sloss and F. M. Leland constitute the San Francisco finance committee of the California Miners' Association in connection with the reception and entertainment at San Francisco of the American Institute of Mining Engineers next September.

Recently Declared Mining Dividends.

Boston-Little Circle Zinc Co., 1%; payable Aug. 1.

Boston & Montana, regular quarterly dividend $4 per share and $6 extra; payable Aug. 21.

Quincy M. Co., Michigan, $6; payable Aug. 15.

Homestake M. C., South Dakota, regular monthly dividend 25 cents per share, 25 cents extra; July 20.

Colonial Lead & Zinc Co., first monthly dividend 1%; payable Aug. 1.

Grass Valley Exploration Co. (W. Y. O. D. mine), dividend No. 3 of 25 cents per share, $7500; July 20.

Sacramento M. Co., Mercur, Utah, dividend ¼ cent per share, $5000; payable Aug. 1. Total for year, $35,000.

Pennsylvania M. Co., Nevada City, Cal., dividend No. 31 of 25 cents per share, $10,000; payable Aug. 1.

Hidden Treasure drift mine, Placer Co., Cal., dividend 10 cents per share, $3600; July 20.

High Five mine, Colorado, $10,000; July 25.

Recent Mining Incorporations.

Maple Creek G. M. Co., San Francisco; capital stock, $200,000; W. E. Shepman, C. A. Malm, J. Zederman, P. J. Miller, A. H. Winn, San Francisco.

Mines and Machinery for Sale at Public Auction.

The Harqua Hala (Arizona) Gold Mining Company will on Monday, August 14th, 1899, at 12 o'clock noon of that day, at the Court House door at Yuma, Arizona, offer for sale to the highest bidder all its mines, mill site, pumping plant, 40-stamp mill, cyanide plant, engines, boilers, machinery (fixed and movable), and stock of merchandise situated at Harqua Hala, Yuma Co., Arizona. Inventories and information may be obtained from C. Daliman, agent at Harqua Hala, or Lindley & Eickhoff, attorneys, 530 California St., San Francisco. Terms of sale: Cash, U. S. gold coin, payable twenty per cent on acceptance of bids, balance on delivery of possession. Title to mines U. S. patents. By order of the Board of Directors.

List of U. S. Patents for Pacific Coast Inventors.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONTINUOUS SPINNING TOP.—James Wallace, Sacramento, Cal. No. 629,055. Dated July 18, 1898. This invention refers to tops and means by which they may be made to spin and the motion kept up indefinitely by occasional pressure. The top consists of a disk or other form of suitable weight and size having a hollow central shaft extending above and below. A point at the lower end of the shaft serves as a support upon which the top may spin. Within the shaft are lugs or pins and a screw of rapid pitch is adapted to slide between these pins. A spring in the bottom of the hollow shaft forces the screw up, and when, by pressure upon the head of the screw, it is forced down without turning, it causes the top to turn by its action on the pins between which it passes. As soon as pressure upon the screw is released it rises and when again pressed upon the same action takes place. A sufficient speed of rotation is thus produced to keep the top in rapid motion, and whenever it begins to run slowly one or two more pressures upon the screw will increase its speed and keep it running. In order to conveniently apply the pressure a pressure head is fitted to the stem forming the upper end of the screw and is loosely turnable upon it, when no pressure is applied to the head. When pressure is applied to the head it forces it into contact with a disk which is fixed upon the screw shank, and sufficient frictional contact will be produced to prevent the screw from turning so that the downward pressure acts through the screw to turn the top. As soon as pressure upon the head is relieved the screw can turn freely in unison with the movements of the top and without retarding its rotation.

HAY PRESS.—W. H. Gray, San Leandro, Cal. No. 629,030. Dated July 18, 1899. This invention relates to improvements in hay presses of that class in which the follower is moved in the press box by means of a horse or other power transmitted through a chain sheave and intermediate machinery. The invention consists of a vertically journaled column, a chain-driving sheave fixed thereto, mechanism by which the column and sheave are turned sufficiently to compress the bale, then disengaged and allowed to return to their normal position, an air cylinder with a plunger movable therein and adapted to form a cushion when the parts are allowed to suddenly return after being disengaged. A spring-pressed latch pivoted upon the lever arm and a lug projecting from the sheave engage each other and move the arm until the piston has reached the end of its outward stroke, the lug being then detached or disengaged.

CATAPULT FOR THROWING PROJECTILES.—C. F. McGlashan, Truckee, Cal. No. 629,044. Dated July 18, 1899. The object of this invention is to provide a catapult or mechanism which can be made available for the purpose of throwing bombs and other projectiles to a distance, and means by which the trajectory and distance to which the projectile is thrown may be accurately estimated and proper provision made to accurately place it. It consists of a plurality of coiled springs having anchor arms by which the ends adjacent to the coil are held in place, means for drawing down the long or throwing arms so as to produce a tension upon the spring which will act when the arm is released to throw said arm through its arc of travel at a high rate of speed. This throwing arm is provided with a cup which is adapted to hold the projectile, and means for lengthening the arm and adjusting the cup are also provided. A scale is fixed with relation to the arms so that the trajectory and distance to which the projectile may be thrown by the use of springs can be accurately determined.

BOX COUCH.—John Hoey, San Francisco, Cal. No. 629,034. Dated July 18, 1899. The object of this invention is to provide a couch, sofa or like article in which an improved means is shown for connecting the seat and upper portion with the box base, and to provide for a graceful configuration of the front in making the connections. The couch is made in two parts, the seat portion and the box base, the latter having the upper part extending toward the main vertical end of the box and a transverse uniting strip between the projecting ends. The rear edge of the seat is hinged to the base, and at the corresponding end of the box is an arm extending upwardly and outwardly with a downwardly depending projection which overlaps the end of the box extension. The front of the arm and the front of the box have a continuous line of reverse curvature from the top of the arm to the bottom of the box. A connecting concavo-convex link is pivoted upon the tilting seat portion and has its lower end slidable through a link or loop which guides it in opening and closing, and which forms a stop to hold it in place when the seat has been opened for the purpose of removing the contents of the box.

A Practical Mining Man Wants a Position as Superintendent or Assistant.

Good assayer and first-class shaft man. Will go anywhere. Six years with last company. Best of references. Address E. K., care this office.

POSITION WANTED by an experienced cyanide man, assayer and chemist, preferably in charge of a cyanide mill. Speaks Spanish. Technical graduate. Can furnish a good assay outfit if desired. Address W. J. P., care of this paper.

Millman of 15 Years' Experience
WISHES A SITUATION.
Will go anywhere in California. Can give the best of references. Address D. F., care this office.

WANTED, SITUATION
AS SALESMAN AND BOOKKEEPER IN MINING CAMP. Competent to take charge of store. Address S. E., this paper.

Underground Foreman
WANTS WORK.
Practical, experienced, intelligent, and up-to-date working of gold, silver or copper mines, whether small or large. Moderate salary. Good references. Address
C. L. LANG, Sonora, Tuolumne Co., California.

WANTED—Second-Hand Huntington Mills, 3½ Ft. or 5 Ft. Must be in good condition. Send age and lowest cash price f. o. b. nearest railroad point, to L. Z., this office.

Wanted—At the Zantgraf Mine,
NEWCASTLE, CAL.,
Ten Able-Bodied Muckers and Carmen.

WANTED,
4-INCH BLACK PIPE; ALSO ROUND IRON FROM ½ TO 1½.
Must be in fair condition. DYER BROS., 117-119 Beale St., San Francisco.

WANTED.
20-STAMP GOLD MILL,
Complete with Power, Feeders, Plates and Concentrators.
Must be nearly new and in first-class condition. Give full particulars and price f. o. b. cars or steamer, or as it stands. Address "ALASKA," care of Mining and Scientific Press.

PACIFIC EXPLORATION COMPANY
Finds buyers or working capital for meritorious mines or good prospects. Correspondence invited.
W. E. Holbrook, Pres't. L. F. Haskell, Sec'y.
29-30 Chronicle Building, S. F

Group of Gold and Silver Mines for Sale.
For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.
For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

Mining Properties
of merit, bought and sold. A specialty made of mines in Mexico and the Southwest. Whether a buyer or seller let me hear from you. Mines examined and reported upon.
H. E. RUNKLE, Mining Broker, El Paso, Texas

Hydraulic Mines for Sale in Similkameen District, British Columbia.
667 ACRES. 5000 INCHES WATER IN DRIEST PART OF SEASON.
Two years' working bond will be given on favorable terms, or lease with option.
HOPE, GRAVELEY & CO.,
536 Hastings Street, - Vancouver, B. C.

..CRIPPLE : CREEK..
FOR SALE—CYANIDE PLANT,
100 tons daily capacity; in first-class condition to handle Cripple Creek ores.
Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

F. B. COOK & CO., MINES AND MINING,
Atlas Block, Salt Lake City, Utah.
Properties reported on and development work superintended for investors.

AIR COMPRESSORS, Catalogues.
Rock Drills, Coal Cutters, Lift Pump, Pohle and Stone Channelers.
The INGERSOLL-SERGEANT Drill Co.,
Havemeyer Building, NEW YORK.
San Francisco Agents, PARKE & LACY CO., 203 Fremont Street.

Trade Mark. Trade Mark.
SCHOTT & GEN. JENA
Jena Normal Glass,
THE BEST LABORATORY WARE MADE.
Everything necessary for the
Assayer and Chemist
will be furnished of best quality at *reasonable prices.*
UNEXCELLED BALANCES, WEIGHTS AND PLATINUM.
EIMER & AMEND,
205-211 Third Ave., NEW YORK.

DEWEY, STRONG & CO.,

TEL. MAIN 5752. OFFICE, 507 MARKET ST., SAN FRANCISCO, CAL.
Sole Manufacturers of Anti-Caloric Sectional Coverings in Canvas Jacketed Sections and Blocks for Boilers.
ANTI-CALORIC PLASTER—The Best and Cheapest Insulating Plaster in the Market.
Send for Samples and Prices. Factory, Potrero.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

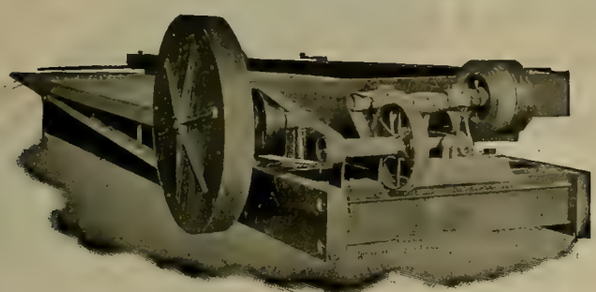
For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.



WHITE, ROGERS & CO.,

Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

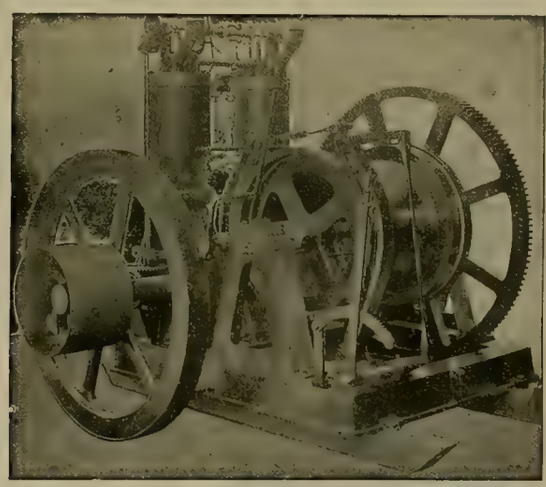
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

..Our Baby Hoist..

A remarkable record--don't you think?

READ WHAT THE SUPERINTENDENT OF COLORADO'S DEEPEST MINE SAYS:

THE GEYSER MINING AND MILLING CO., SILVER CLIFF, COLO.

The Hendrie & Bolthoff M'f'g & Supply Co., Denver, Colo.—GENTLEMEN: It may be of interest to you to know that we are now down 2600 feet with your Baby Hoist (4x6 Double Cylinder) which we purchased some time since. With this engine we are now handling the rock and ore broken by three shifts of four men each, and have had no difficulty whatever in so doing.

This engine stands in our 2400-foot level and is hoisting from the 2600-foot level. It is operated by air.

Very truly yours, W. J. ELMENDORF, Superintendent.

St. Valentine's Day, 1899.

We are selling these on a guarantee to hoist 1000 pounds 200 feet per minute from a depth of 350 feet.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B to

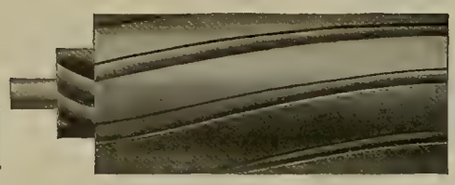
THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : : :



Thoroughly Protected by Strong Patents. Write for Circular.

P & B ROOFING

ROOFING is to a building what clothing is to the body. It must protect and it must wear well. To put money in an interior and to save it on the roof of a building is poor economy.

P & B ROOFING possesses all the requirements of a first-class roof covering. It is waterproof, durable, inexpensive, easily laid. Ask your dealer for a circular, or address the makers.

Market Reports.

SAN FRANCISCO, July 27, 1899.

SILVER.—London, 27⅞d; New York, 60¼; San Francisco, 60¼; Mexican Dollars, 49@@50; New York exchange, sight, 10; telegraphic, 12½ cents premium.

LEAD.—New York reports firmer, $4.40 bid, $4.57½ asked; brokers' price, $4.35.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¼c; bar, 6.50c.

COPPER.—New York reports Lake firm at $18.50; brokers' price, $18.50; mill copper plates, 23¾c.

The copper market is firm, evidently being maintained by the steady disappearance of the metal as fast as marketed by the producers. Formerly a large amount of the output from the mines was held at the various smelting works or sent to various points to await shipment on consummation of sales, but now producers have their output sold up while it is yet in the mineral, or even possibly in the rock before it has reached the stamp mill, and it is a rush to bring it from drifts and shafts, put it through the stamping process, hurry it to the smelter, load it on the cars and send it by the fastest and most direct route to the consumer, who has it in the crucible with an alacrity that is truly ingenious.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¼c per lb.

STEEL.—15@16c per pound.

TIN.—Unsettled; $31.75@32.50; pig, 35c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $43.50; export, $39.50@40; carload lots, special rates.

PLATINUM.—London, 63⅛s per ounce; York, $16.25; San Francisco, $16.75.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15¼c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5¼c; 6s, 10 oz., 5¼c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7¼c; 6s, 10 oz., 6¼c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

CHEMICALS.—Cyanide of potassium, jobbing, 32@33c per lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 4½@5c per lb.; borax, refined, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1¼@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 14c; chlorate of potash, 25c; caustic potash, 12c.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.

Assessment Notices.

SAILOR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of July, 1899, an assessment (No. 1) of eleven cents (11c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 318 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of August, 1899, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 18th day of September, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors
M. C. LUND, Secretary.
Office—318 Front street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of July, 1899, an assessment (No. 14) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of August, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of September, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
F. METTMANN, Secretary.
Office—237 12th street, San Francisco, California.
The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

CENTRAL EUREKA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of July, 1899, an assessment (No. 75) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 9, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of September, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of September, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
WM. A. M. VAN BOKKELEN, Secretary.
Office—Room 9, 320 Sansome street, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of July, 1899, an assessment (No. 116) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 14, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on FRIDAY, the 18th day of August, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 7th day of September, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
E. L. PARKER, Secretary.
Office—Room 14, Nevada Block, No. 309 Montgomery street, San Francisco, California.

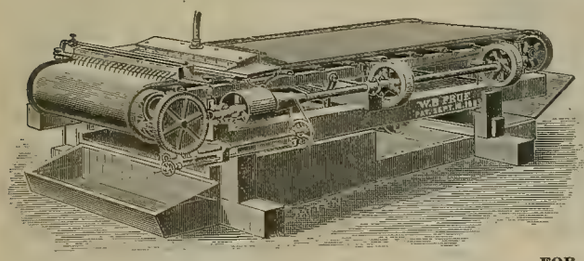
OFFICES: VANCOUVER AND VICTORIA, B. C.



For Testing Placer Ground.

Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes.
Write for Catalogue and full information.
KEYSTONE DRILLER CO., Beaver Falls, Pa.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

MANUFACTURERS OF

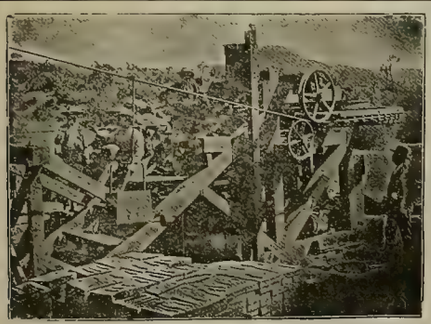
Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.



Send for Dredging Catalogues Nos. 15 and 16.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

THE CALHOUN EXCAVATOR.

A COMBINED POWER-SHOVEL AND CABLEWAY.
.....Ask for Circular.....

Cableways,
Double Rope Tramways,
Wire Rope Transmissions,
Incline Planes,
Logging Machinery,
Suspension Bridges,

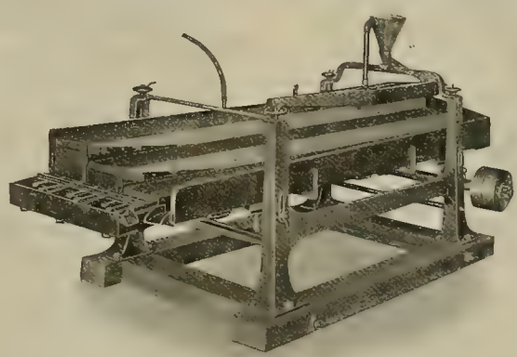
DESIGNED, FURNISHED, ERECTED. Write for Estimates.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

THE BARTLETT CONCENTRATING TABLE.

One of these Machines will take the place of TWO or THREE Belt Concentrators of any make and do as good work.

Separates ALL the minerals from each other at one operation.
Gives THREE CONCENTRATES on the one Machine at the same operation.
The Machine is especially adapted to the separation of Zinc and Lead.



- PRICES: -

10-ft. Table, $300.

12-ft. " $350.

[illegible] 100 to 1200 respectively.

CAPACITY.....10 to 30 tons per 24 hours.

TWO SIZES OF MACHINES ARE MADE.

Table B, 6 into 1 to 16 into 1.
Table C, 12 into 1 to 32 into 1.

Parties desiring tests made can send 500 lbs or more, charges prepaid, and a run will be made and reports forwarded of the results, free of all charges, except for the assays, which will not exceed $10.00.

CAN BE SET UP ANYWHERE.
REQUIRES NO SPECIAL FOUNDATION.

Licensee for the Manufacture and Sale, **PARKE & LACY CO.,** 21 & 23 FREMONT STREET, San Francisco, Cal.

AGENT FOR

KNOWLES PUMPS and PULSOMETER PUMPS,

The Gigantic Vertebrate Fossils of Wyoming.

A party of geologists from the Northwestern University, headed by Professor A. R. Crook, is now in Wyoming for the purpose of exploring the fossil fields of that State in the interest of science, at the invitation and expense of the Union Pacific Railroad Co., to whose passenger agent, E. L. Lomax, this paper is indebted for the accompanying cuts. The party is accompanied by Professor W. C. Knight of the Wyoming State University. Wyoming has been referred to as the geological wonderland of the world. Within its borders are the most extensive fossil-bearing terranes known to science, and here are found the most gigantic specimens of land animals that ever had an existence since the world began, beside which the largest elephant of modern days becomes a pigmy. The largest of these fossil colossal animals was discovered last August by W. H. Reed of the Department of Geology of the Wyoming State University, ninety miles northwest of Laramie city. It was a Dinosaur, measuring 130 feet in length, 35 feet in height at the hips and 25 feet at the shoulders, the petrified skeleton of which, it is thought, will weigh 40,000 pounds. In the Yale museum at New Haven, Conn., is a gigantic Brontosaur, an animal of a kind similar to the Dinosaur above referred to. This also came from Wyoming and from the same formation—the Jurassic. The skeleton was restored by Professor Marsh in 1891. It was 70 feet in length and is presumed to have weighed in life 80,000 pounds, being surpassed in this respect 50,000 pounds by the new discovery. This animal, the skeleton of which is represented in Fig. 1, was 25 feet high at the hips and 16 feet at the shoulders. Fig. 2 illustrates a section of the vertebra of the animal and is 44 inches in height. Its femur is more than 6 feet in length. Two of these enormous bones are shown in Figs. 3 and 4. The femur of the Dinosaur recently discovered is 8 feet in length. The body of the Dinosaur is comparatively short but very thick. Mr. Reed says of the animal, the skeleton of which he is restoring: "An accurate idea of the Dinosaur is out of question. The ribs of this animal are about 9 feet in length, his tail 60 feet, his neck 30 feet, his abdominal cavity with lungs and entrails removed would have formed a room 34 feet in length, 16 in width and arched overhead probably 12 feet in height, a space in which forty people might be seated. A round steak from the ham of the animal would have been 12 feet in diameter and would have had a solid bone in the middle 12x14 inches, with no hole for marrow. The smallness of his head is a peculiar thing. I should say the head of this colossal Dinosaur was not larger than a ten-gallon keg. He must have been a very sluggish creature, as his brain cavity would certainly not warrant the belief that that organ weighed to exceed four or five pounds." Fig. 6. represents the reconstructed skeleton of the Aceratherium Tridactylum, a huge mammal having three toes to each foot. There were also camels, dogs, cats, rhinoceroses, elephants and monkeys, great sea monsters, fish, etc., and fossil leaves prove conclusively that in the early ages Wyoming was clothed with trees of tropical and semi-tropical verdure. Wyoming has no equal as a fossil field, and while expedition after expedition has taken away material by the carload, the fields are large and hundreds of square miles have never been visited by geologists. The numerous mountain ranges have tilted the rocks and erosion has cut deep valleys leading from them, which makes it possible to examine the formation in detail.

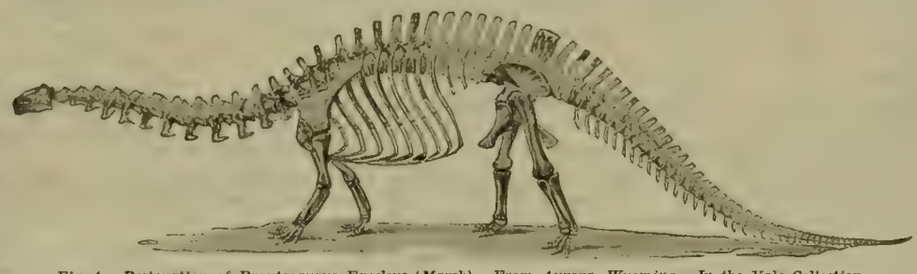

Fig. 1.—Restoration of Brontosaurus Excelsus (Marsh). From Aurora, Wyoming. In the Yale Collection.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Restoration of Brontosaurus Excelsus; Dorsal Vertebra of Brontosaurus; Femur of Brontosaurus; Scapula, Coracoid and Humerus of a Large Dinosaur; Restoration of Aceratherium Tridactylum, 141. Oil Well—Upright Fold; Inclined Fold; Overturned Fold; Folds Cut Down by Erosion; Folded Strata; Oil Line Developed on One Slope of Fold; Oil Line Developed on Both Slopes of Fold, 144. Fold at Modello Oil Wells, Ventura Co., Cal.; Fold on Piru Ranch, Ventura Co., Cal.; Portion of Recumbent Fold, San Pedro Peninsula, Los Angeles Co., Cal., 145. Oil Line on One Slope of Fold, on the Other Destroyed by Faults; Position of Strata Previous to Formation of Fault; Position of Strata Subsequent to Formation of Fault, 146. Latest Mining and Metallurgical Patents, 147. Dredger "Lippencott" at Placerville, Boise Basin, Idaho, 149. Cyanide Plant at Progresso Mines, La Paz, Lower California; Bottom Discharge Door of Leaching Tank; Small Experimental Cyanide Plant; Large Experimental Cyanide Plant, 150.

EDITORIAL.—The Gigantic Vertebrate Fossils of Wyoming, 141. Capitalization and Dividends; Petroleum Mining; Haste in Paying Dividends; Quotations of Lake Copper; Miscellaneous, 142.

MINING SUMMARY.—151-52-53.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 166.

MISCELLANEOUS.—Concentrates, 143. Notes on the Oil-Yielding Formations of California, 144-145-146. Boring by Diamond Drill; Accident at the St. Lawrence Mine, Butte, Mont., 146. Latest Mining and Metallurgical Patents, 147. Some Experiences of a Working Miner; Hawaiian Island Volcanoes; Dredging in New Zealand, 148. Dredging and Mining in Boise Basin, Idaho; The Precipitation of Gold From Cyanide Solutions, 149. Tanks for Cyanide Plants, 150. Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recent California Dividends; Recent Mining Incorporations; Commercial Paragraphs, 153.

In British Columbia mines and elsewhere the labor troubles were adjusted a few weeks ago by operating under a contract system. This seems to give satisfaction, as the mines continue to run and no trouble has as yet appeared in the camps where this system was adopted.

Copper for immediate delivery in large lots seems to be obtainable in the Lake Superior region. The Calumet & Hecla Co. recently sold 5,000,000 pounds of metal at 18½ cents per pound for immediate delivery. It is the established policy of the company not to sell for extended future delivery.

The smelter strike in Colorado has not yet been settled. The board of arbitration officially suggested a wage scale which was declared to be acceptable to the workmen, but the American Smelting Co. says it cannot pay the scale without an increase of expense, and as they have already reduced the charge of ore treatment to the minimum figure the new scale can only be adopted by adding the additional cost to charges. This will affect the miners directly.

Adventurers from Klondike and Alaska continue to bring conflicting reports as to the richness of the mines of that country; but a glance at the condition of the great majority who are returning should satisfy anyone that the chances for making a sudden fortune are no better than they are in the mining regions of the United States. A large amount of gold is coming from the North, it is true, but it represents a vast amount of labor, hardship, privation and death, and the most of it belongs to the transportation companies, having been taken in by them at their stores and offices for supplies sold, and for transportation. Where the names of individuals appear as possessing large amounts in gold, these statements are nearly always grossly exaggerated. One statement was observed that a miner packed $60,000 in nuggets on his back over the mountains. This amount of placer gold would weigh more than 250 pounds, and there are few men who can lift it, to say nothing of carrying it. Many of the returned stampeders are "broke" but would rather have it appear that they are the possessors of considerable wealth for obvious reasons.

Capitalization and Dividends.

Much stress is laid upon the amount of capitalization of mining companies. Numerous corporations are formed for the purpose of operating mines of more or less merit, and these are capitalized at sums ranging all the way from $5000 to $30,000,000 and more. At the beginning of operations it is often the case that the mine is a prospect justifying capitalization at a merely nominal sum, but not infrequently enterprises of this character branch out with a capitalization of $5,000,000 to $10,000,000. What useful purpose this excessive capitalization serves does not appear. Of the numerous mining corporations now in existence and operating in the United States less than twenty on the dividend-paying list have paid dividends exceeding their capitalization, while there are about an equal number which may, in the course of a few more years of success, equal to the past, be able to pay an amount in dividends near their capital, and perhaps exceeding it, but there are hundreds of companies which have never yet, and in all probability never will pay an amount approximating one-tenth of their capitalization, and there are a great many more that have never paid any dividends at all, and never can, whose capitalization runs from $1,000,000 to $10,000,000 and over. The most noted instances of mining companies that have paid dividends exceeding their capitalization are that of the Calumet & Hecla, which has paid $62,850,000 on a capitalization of $2,500,000; the Boston and Montana, with a capitalization of $3,750,000, has paid $10,775,000, and others have paid 200% to 300% on their capital, but these are exceptions.

With the financier who is not a miner an estimate is made of the amount of a dividend on the basis of interest on capital invested. Thus a mine pays $50,000 each month in dividends and the company is capitalized at $12,000,000. In a year this company will pay its stockholders, if dividends are not interrupted, $600,000, which is 5% of the capital stock. Stock in this concern may be quoted at par or above it without there being anything to demonstrate that the dividends will continue long enough to justify any such conclusion. At the rate indicated it would require twenty years to recover an amount equal to the capitalization (which in this case may represent the price of stock), and this allows for no interest on the investment.

Mining is legitimate when properly conducted, and dividends are the prime factor in the business, but those who pay excessive prices for stock simply because it is in demand are likely to suffer financial loss. As soon as the stock of a paying mine leaves the realm of legitimate business and enters the speculative it is no longer a safe investment, but must be placed on the same plane as other risky investments.

Petroleum mining is now attracting more attention in California than at any previous time. Oil has been known to exist for many years in certain districts hundreds of miles apart, but it is only within recent years that the industry has grown to large proportions. The field near Newhall and in the Puente hills in Los Angeles county have been producers for years, and more recently the Coalinga, Fresno county, and Santa Barbara fields have been opened and produced largely. Within the past two years, however, wells have been put down in new territory and the known field has been extended materially and is still growing broader. Within the past few weeks there seems to be a growing tendency to create a "boom" in oil development, and oil developing companies are being organized *ad libitum*. Without doubt, most of these companies are being organized for legitimate operations, with tracts of land so situated, geographically and geologically, that there is a reasonable probability, if not assurance, of success. There are others, however, which, unfortunately, do not possess any of the essential features of success and which are wildcat operations pure and simple. A perusal of the various prospectuses would lead the investing public to believe that all that is necessary is a tract of land, a tall skeleton frame, called a derrick, a deep hole in the rocks, and fortune will gush up from the earth and stockholders will only be required to sign the company's books to receive their dividends. That this fortunate termination of oil enterprises is not always realized is a well known fact. Dry holes and water holes are far more numerous than even mediocre pumping wells. It is also a fact that the wells which have thus proved failures have in almost every case been sunk haphazard, without the slightest regard to the geological conditions which control the occurrence of petroleum. In this issue is commenced the publication of a series of illustrated articles on petroleum in California, by W. L. Watts, which clearly explains the conditions under which petroleum occurs in California.

August 1, 1898, Lake copper was quoted at 11½ cents per pound. August 1, 1899 it was quoted at 18½ cents a pound, an increase of 7 cents. That this means a large increase in revenue to copper mining companies everywhere, without material increase of cost, is evident. Under the stimulus of high price for the metal it would naturally be supposed that the production of the largest mines would be greatly increased, but such, strange to say, is not the case. In some instances there has been a notable increase in output, but in others, where it was expected, it did not materialize. A great mining enterprise is usually run at or near its full capacity, and to increase it at short notice is not possible. It involves not only the opening up of more territory in order to obtain increased output of ore, but it necessitates often an increase of hoisting capacity, and possibly the sinking of a new shaft, but even were it possible to increase the output of ore the metallurgical department would in most cases be unable to take care of it. This is particularly the case where stamping and concentration are necessary. Large concentrating mills and reduction works, such as are employed in the treatment of copper ores, cannot be built at short notice. Mines which ship to custom smelters can largely increase their output by increasing their shipments, but not so with large mines which have reduction plants of their own. In some of the largest copper producers the companies have not received the full benefit of the highest prices, as they were sold several months ahead at the lower figures. The outlook for the coming months, and particularly for 1900, is that the copper production will be largely augmented by the additions now being made to the large mines and reduction works, and the springing up of new enterprises which will help to swell the total production.

Haste to pay dividends on the part of a newly organized mining company often operates to the great disadvantage of the concern later, and sometime in its collapse. Dividends are undoubtedly a desideratum and the object for which mining companies are organized, but it is better to set aside the first profits of operation as a contingent fund to replace the surface plant in event of loss by fire, or to enlarge it if necessary or desirable. When this can be done without making a call upon stockholders the stock of the company is always held at a higher figure than where assessments are levied. An Oregon company recently organized paid a dividend within a month of its organization from the proceeds of ore milled which had been extracted from the mine by former owners. It is to be hoped that it is only the first of a long series of dividends, but, generally speaking, it is an excellent maxim to "make haste slowly" when declaring dividends. Most of the large and successful mines of the world carry large treasury balances, and any irregularity of operations at the mine are unnoticed by stockholders, as dividends continue regularly. The business of a mining company should be conducted with as much care and foresight as that of a bank.

A well-known mine owner and operator has been quoted as saying: "A mine that will not pay under any kind of management is not much of a mine." In a great measure this is true, but it is also equally true that good and experienced management has made a success of mining operations where poor management failed absolutely.

The duties of a mine manager are manifold. He should be an engineer, a metallurgist, a chemist and assayer, a good business man, and must possess, above all, that peculiar element known as common sense. All of the above qualifications are not absolutely essential to success, but to attain the highest success the most of them are.

Concentrates.

THE steamship Oceanic is 704 feet in length.

NELSON, B. C., miners are paid $3 for eight hours work.

IN the shut-down of the Parrot smelter, Butte, Montana, expects to suffer less from smoke.

COPPER was first discovered on Lake Superior in 1844, but no metal was shipped until the following year.

LIMESTONE and quartzite should not be referred to as dykes, as they are both sedimentary. Dykes are eruptive.

MONTANA codes are compiled from California law and have been adopted by Gen. Otis as the law of and for the Philippines.

THE Yuba county, Cal., Superior Court has made an order transferring the hydraulic mining suit to the U. S. Circuit Court at San Francisco for trial.

SO FAR as known the deepest working in Canada is at the Eustis mine, Eustis, Quebec, where in mining for pyrites a depth of 2500 feet has been attained.

IT is said that several thousand dollars in coarse gold was picked up in early days on the surface of the ground on the summit of Rich hill, in Yavapai Co., Ariz.

THE Oxford Copper Co. of New York recently received 250 tons of copper coins for melting, the metal being worth more for commercial purposes than for coin.

THE Carson, Nev., assay office pays coin or San Francisco exchange for bullion over 500 fine in gold if it does not contain more than fifty fine ounces silver in any one deposit.

MEMBERS of the Canadian Mining Institute, which meets next month, propose visiting San Francisco during the September session of the American Institute of Mining Engineers.

A CLASTIC ROCK is one made up of fragments of older rocks, as sandstone. A rock of this description will reveal its structural condition at a glance under the polarization microscope.

IRON ORE must be analyzed before its value can be determined. A high percentage of iron does not always signify a valuable ore. The occurrence of sulphur and phosphorous in an iron ore is detrimental.

THE greenish-gray rock so common to the Coast Range of California is not diorite, but sandstone, and appears to have been formed largely from granitic detritus. A rock of this character is known as arcose.

TO FIND the horse power of a belt's transmission, multiply the width of the belt in feet by the number of hundred feet the belt has traveled in one minute: e. g., a belt 2 feet wide running 150 feet per minute equals 300 H. P.

E. D. PETERS JR. in his work, "Modern Copper Smelting," defines pyritic smelting as "the fusion of sulphide ores by the heat generated by their own oxidation, and without extraneous heat, such as carbonaceous fuel, the electric arc, etc."

LIQUID ASPHALT is being employed to sprinkle the highways of Kern county, Cal., near Bakersfield. The indications are that the experiment will prove successful. Crude petroleum has been successfully employed elsewhere for the same purpose.

METASOMATISM is thus defined by Dr. G. F. Becker of the U. S. Geological Survey: A change effected by the action of mineral solutions having an extraneous origin, but not necessarily or usually involving a total replacement of the material acted upon.

QUESTIONS are easier asked than answered, and inquirers must exert a reasonable degree of patience. It is not always practicable to give immediate accurate reply to technical queries, as such inquiries often have to be referred to specialists.

THE gold-in-the-goose stories that annually come from Oregon and Washington, alternated with tales of fir bark assaying "high in gold," are slightly varied this season by allegations from Seattle and Tacoma of the discovery of gold in a duck's crop.

THE Privy Council of England has ruled that the British Columbian law making it unlawful to employ Chinese underground in the coal mines of that province is unconstitutional, the judgment of the full court of the province to the contrary being set aside.

DYKES accompanying veins are not always older than the veins; often they are younger and cut the vein. In many instances the vein is later than the dyke and has formed wholly within the dyke, while as often a vein is found at contact with the dyke and country rock.

LIGHT requires eight minutes and eighteen seconds to pass from the sun to the earth. When one looks at the sun vertically it is seen not where it actually is, but where it was eight minutes and eighteen seconds prior, its true place being in advance of its apparent place.

WHERE a narrow strip of slaty or schistose rock is found in contact with a vein in granite this strip is usually of metamorphic origin, being the granite altered by shearing and compression to a shistose or slaty condition. This effect is also often observable along veins in diorite, diabase and, in fact, in most massive rocks.

TO DETERMINE the amount of water evaporated in a boiler, take the mean between the widths of the two levels at the beginning and end of a space of fifteen minutes. Multiply the constant length of water surface with this mean width, and multiply their product by 4. This gives the amount evaporated in cubic inches.

FOR convenience in handling timbers in a large mine, winzes should be cut in or near the foot wall of a vein, reaching from level to level. Timbers to be used in the stope are lowered or run down through the winze and delivered on the floor where they are to be used, saving much time in underground hoisting; and the winzes also improve ventilation.

THE trouble with the machine-driven countersunk rivets is probably because the rivets are a trifle too long. The excess material spreads out under the die and overlaps the hole. Being thin, this edge hardens quickly, and then no amount of pressure will upset the body of the rivet any further. It will appear tight until chipped, when it is often found to be loose.

ZINC should not be used in contact with copper, iron or lead, as voltaic action is set up, especially when moisture is present, thus destroying the zinc. Salt, lime, water containing lime, and acid woods are also very destructive of it. When first exposed to the action of the atmosphere, it is speedily corroded, but the film of carbonate of zinc thus formed protects it from further oxidation.

IN the State of Michigan the wages of miners working in mines owned by a corporation take precedence over a mortgage even though the mortgage may have been recorded and the money advanced thereon prior to the performance of the labor and for which the wages accrued. The statute gives them a preference over all other debts and claims of every character except taxes, fines and penalties.

STEARINE, in a chemical sense, is the name of the ethereal salt of glycerine, present in all neutral animal fats. Industrially and commercially, it is applied to the solid mixture of fatty acids, principally palmitic and stearic, obtained in the decomposition of fats, and employed for the making of candles, but the name more correctly describes the hard fat obtained from neutral fats by pressing, and is occasionally used in this sense.

WHERE a windlass is employed either under or above ground, it will be found a great saving to pass the rope over a sheave wheel suspended above the shaft in line with the bucket, and to construct a runway for the skip or bucket extending above the level or windlass platform. By arranging an automatic dumping bucket, such as described herein in the issue of July 22nd, the bucket may be dumped into a car, saving much time.

TO PRESERVE wire rope laid under ground, or under water, coat it with a mixture of mineral tar and freshslaked lime in the proportion of one bushel of lime to one barrel of tar. The mixture is to be boiled, and the rope saturated with it while hot; sawdust is sometimes added to give the mixture body. Wire rope exposed to the weather is coated with raw linseed oil, or with a paint composed of equal parts of Spanish brown or lampblack with linseed oil.

THE influence of a dyke cutting a vein is not unfrequently noticed in the concentration of mineral (often gold) along its course. In the Bandarita mine, Mariposa Co., Cal., a well-defined vein is found in a black slate formation. The vein has been extensively explored, and was found uniformly low grade except where a dyke crossed the line of the lode, and here a pocket or shoot was found lying in the vein along the dyke, from which it is said $40,000 was taken in a few days.

A BOOSTER is a machine inserted in series in an electric circuit to change its voltage, and may be driven either by an electric motor or otherwise. In the former case it is a motor booster. A motor generator is a transforming device consisting of two machines—a motor and a generator—mechanically connected together. A dynamotor is a transforming device combining both motor and generator action in one magnetic field, with two armatures or without an armature, having two separate windings.

AN item in a Virginia City paper, widely copied, that the Joshua Hendy Machine Works of San Francisco has bought the machinery of four Comstock mines illustrates one advancing phase of mining matters. The machinery so bought, when new, cost hundreds of thousands of dollars. It was good in its day, but became obsolete. It now goes as old iron to the foundry, and will be melted up and made into new and improved forms of mining machinery, perchance to go back in its new form to again do duty on the Comstock.

SOME geologist has calculated that it has taken Niagara Falls 360,000 years to cut its way upstream a distance of six miles. Large masses are detached from time to time and in this manner the falls gradually are progressing upstream. Others who have studied the effect and rate of errosion say that it has required 400,000 years for the Grand Canyon of the Colorado river to cut its way down 11,000 feet or more into the rocks of Arizona. Such calculations are not of material importance or benefit, as there is insufficient data upon which to base them.

WHERE several co-owners abandon a claim, and one of them desires to relocate, he must proceed to "advertise out" his former partners. The Supreme Court of Utah has rendered a decision in point in which it holds that such relocations inure to the benefit of all original joint locators and that the relocator holds the title thus acquired in trust for them. The court points out that the proper course of procedure is for the one relocating to "advertise out" the others in the manner prescribed by the federal statutes, in case he desires to become the sole owner.

COPPER and lead do not readily form homogeneous alloys, to obtain which the two metals must be melted together beyond the fusing point of copper and then quickly chilled. When such an alloy is gradually heated to the melting point of lead, part of the latter may be separated from the copper, the copper retaining some lead remaining as a porous mass. To remove the copper from the lead an addition of zinc is necessary. Ordinarily the percentage of copper in lead does not interfere with mechanical use; it appears to benefit by protecting the lead against the action of sulphuric acid.

SHAFT REPAIRING may be expeditiously conducted by constructing in one of the compartments—pump compartment preferred—a box or chute of 2-inch plank built in short sections and extending from one level to the next above. As the old pieces of lagging, rock fragments and other debris are removed they are thrown into the chute, descending to the level below, where they are loaded into the skip or car and sent to the surface. The larger timbers cannot be handled in this way, of course. As the work proceeds downward sections of the box are removed to keep pace with the work, and much valuable time is saved.

EASTERN estimates figure that the total value of the mineral production of the United States in 1898 aggregated $709,816,750. The amount was $648,804,899 in 1897. The 1898 production included $65,082,440 in gold and 58,763,127 ounces of silver. The copper production was 535,900,232 pounds; the lead production 228,475 tons; zinc, 114,104 tons; flasks of quicksilver, 30,499; barrels of petroleum, 51,774,465. In addition, there were $23,024,960 gold, 39,748,000 ounces of silver, 36,055,352 pounds of copper, 89,209 tons of lead and 7,127,784 pounds of nickel refined and prepared for market in this country from foreign ores and base bullion.

THE percentage of copper water in various mines of Butte, Montana, varies greatly. The water is pumped from the mines and discharged into large tanks or long lines of sluice boxes set on low grade and containing iron scrap, wrought iron being best for the purpose. Anything is taken for the tanks—old rails, pipes, boilers, tin cans and iron frames. The amount of iron required to precipitate a ton of copper is also a variable quantity. The greater the surface of iron exposed the more rapidly does the copper precipitate. If the water escaping from the tanks or boxes still contains copper, more boxes or tanks are added. Copper water containing twenty to fifty grains copper to the gallon should pay very well when handled in large quantity and with an unfailing or long-continued supply.

THE chemical elements as at present known are seventy-four in number, as follows: Hydrogen, lithium, sodium, potassium, rubidium, cæsium, glucinum, magnesium, calcium, zinc, strontium, cadium, barium, mercury, boron, aluminum, scandium, gallium, yttrium, indium, lanthanum, neodymium, praseodymium, samarium, gadolinium, terbium, erbium, thulium, ytterbium, thallium, carbon, silicon, titanium, germanium, zirconium, tin, cerium, lead, thorium, nitrogen, phosphorus, vanadium, arsenic, columbium, antimony, tantalum, bismuth, oxygen, sulphur, chromium, selenium, molybdenum, tellurium, tungsten, uranium, fluorine, chlorine, manganese, bromine, ruthenium, iodine, osmium, iron, nickel, cobalt, copper, rhodium, palladium, silver, iridium, platinum, gold, argon, helium.

A LOCAL enrichment of mineral veins is often noticed difficult to understand, and in other instances the cause is apparent. In the Mammoth mine, Grub Gulch, Madera Co., Cal., is an instance. The Mammoth vein is the result of silicification of mica slates of the Calaveras formation. It is a large vein and low grade. About 200 feet from the surface a fault occurs which is plainly marked but the displacement is so small as to be scarcely noticeable, but it seems to have had a direct effect on the deposition of gold in the vein, which for several feet above the fault plane became enriched and which near the fracture was very rich, showing much gold. Below the fault plane, however, the value dropped to almost nothing with no other apparent change in the character of the vein. This enrichment was of purely local occurrence and did not extend far from the shaft.

THE 540 stamps of the Alaska-Treadwell mill on Douglas Island, Alaska, crush three and one-third tons of ore every twenty-four hours. At the Tyro mine, near Coulterville, Mariposa county, Cal., the mill crushed one and one-quarter tons per stamp, and at the Gold Hill mine, Calaveras county, Cal., six tons per stamp were crushed in '95. The weight of stamp in each of the above mentioned mills is 850 pounds. The screens were of different degrees of fineness and there may have been some difference in height of discharge and in the width of the mortars, but these three instances demonstrate that no arbitrary capacity per stamp can be fixed upon with equally satisfactory results on all ores. In the case of the Tyro the ore was quartz and the gold fine and rather difficult to save. At the Gold Hill it was free and coarse, easily saved and the ore consisted of a mixture of soft material and hard quartz which give large capacity.

IT often occurs that where two neighboring mines are consolidated under one ownership and it is necessary to connect them by levels that drifts are found already driven some distance toward each other from the respective shafts of the two mines, but these drifts are not at a common level, though near it. It being desirable to utilize the cuttings already made, the difference in elevation of the two drifts may be made use of by constructing an ore bin and chute at the place of intersection, as was done in the Wildman-Mahoney mine at Sutter Creek, Cal. In this instance the connection was made and the Wildman drift was about 15 feet higher than that of the Mahoney. An ore bin was constructed here, to receive ore from the Wildman. A car was run underneath the chute, filled and trammed to the Mahoney shaft. The device proved an economical adjunct to the operations of the mine, and saved the driving of several hundred feet of new drift.

THE oxidation of the upper portion of gold-bearing veins and deposits undoubtedly often results in enriching that portion of the vein. The slow disintegration of a porous gangue, or one made porous by the oxidation of sulphides, offers an unequaled facility for the gold thus freed to settle deeper into the porous portions of the rock, but this process is largely mechanical and will probably account for comparatively few instances where the upper portions of gold-bearing deposits are found enriched. It is not unlikely that the process of oxidation of iron sulphides, nearly always present in gold-bearing ores, forms iron sulphate, which, being a solvent of gold, dissolves the fine particles of gold released from the matrix, and this gold-bearing solution, passing downward by gravity into the porous rock mass, under favorable conditions redeposits its gold, thus enriching the deposit in its upper part and possibly depositing, under some conditions, considerable quantities of gold at one place, forming pockets.

IN large veins a great deal of ore is sometimes lost by the settling of the superincumbent mass of ore upon the timbers of the first few sets above the sill floor, and this weight crushes the timbers and forces them out of line to such an extent that cars can no longer be trammed through the gangways. When this occurs, bulkheading and filling must be resorted to at once to prevent complete collapse. When a case of this kind occurred at the Anaconda mine, Butte City, Mont., and the timbers on the sill floor were forced out of line, the stope was filled with waste and timber as radidly as possible and the level abandoned. A lateral drift was then run in the foot wall 60 feet from the vein, and from it at distances of 60 feet and directly opposite the chutes in the abandoned stope a square set was placed. At each such station a raise was put in and carried up on an incline to the ore body above the filled stope. The drift was in solid granite, but as the raises approached the vein the rock was found decomposed, and required careful timbering. The raises were timbered with square sets, though had the foot wall country been solid no timber would have been required. Through these raises nearly all the ore lost by settling was recovered, by timbering with square sets and filling.

Notes on the Oil-Yielding Formations of California.

By W. L. WATTS, assistant in the field to the State Mineralogist.

[These notes are a portion of a report by Mr. Watts on the petroleum-yielding formations of such districts of California as he has examined. It is understood that his notes are to be published in the form of a bulletin by the State Mining Bureau. Through the courtesy of A. S. Cooper, the State Mineralogist, the MINING AND SCIENTIFIC PRESS is allowed to publish portions of Mr. Watts' notes in advance, in order that the information they contain may be placed before the public at the earliest possible moment.—ED.]

The Value of the Petroleum Industry to California.—It is only of late years that the importance of the petroleum interests of California has been recognized. The value of our petroleum industry is far-reaching. It is represented by the amount of foreign capital expended in the work of extracting and handling the oil, by the price obtained for that portion of our petroleum output which is exported by California residents, and by the value of that portion which is consumed in California. The part consumed in this State constitutes the bulk of our petroleum output, and is used chiefly as fuel, thus becoming one of the leading factors in our commermercial economy. Realizing the importance of these facts, A. S. Cooper, the State Mineralogist, has continued the work of accumulating data concerning our petroleum industry, and the opening of new oil fields widens the horizon of research. Those who are acquainted with the subject recognize the magnitude of the work; they know of the many things required to be done before the details relating to the petroleum industry in California can be so set forth as to be readily assimilated by the public.

Geological Features Pertaining to the Occurrence of Petroleum in California.—There are two phases of geological investigation upon which a right understanding of our petroleum deposits depends: First, a knowledge of the area over which the petroleum-yielding formations extend; second, a knowledge as to the possible course, length and width of the oil lines, or the lines along which remunerative wells can be obtained. With a good topographical map, the first of these propositions can be shown without the expenditure of much time and labor. The second proposition, upon which alone a correct estimation as to the value of our petroleum deposits can be based, must be worked out by a careful study of the structural geology pertaining to the subject under investigation.

To those who explore the hills and mountains of the Coast Range there are few things more interesting than the curiously folded condition of the rocky strata. In California the student of structural geology has not to search very far before he finds natural illustrations of the types of folds he has seen in his text books. In some parts of the world such folds are many miles in breadth, but in the Coast Range the conspicuous folds are generally narrow ones. These small and conspicuous folds usually constitute portions of larger folds, which, although they are more important than the small folds in the formation of hills and mountains, are not so easily detected unless a large area is carefully mapped out and studied. The small folds are, however, of great importance in determining the course and the width of oil lines. It is in order, therefore, to speak of the more common types of folds and structural forms which are familiar to all students of geology, and to say a few words about their relation to petroleum mining.

Types of Folds.—First, the upright fold, as shown in Fig. 1. The strata forming the sides or limbs of this fold slope away at equal angles of inclination from the axis of the fold. Now, provided the structure is not complicated by faults, it is obvious that wells sunk on opposite sides of this fold, and at points equidistant from its axis, would strike the stratum of oil sand at the same depth.

Second, the inclined fold, as shown at *C* (Fig. 2). In this fold the strata forming one side or limb of the fold slope away from the axis at a greater angle than do the strata forming the other side or limb of the fold. If wells were sunk on opposite sides of this fold at points equidistant from its axis, such as at points *A* and *B*, it is evident that a well sunk at point *A* would strike the oil sand at a much less depth than would a well sunk at point *B*.

Third, the overturned fold, as shown at *D* (Fig. 2). In this case a well sunk at point *C* would penetrate the oil sand on both sides of the fold. When erosion has worn away the crown of an overturned fold, as shown in Fig. 3, a geological problem presents itself which in many circumstances requires the investigation of a wide area in order to obtain a satisfactory solution.

Illustration—*D* (Fig. 3) shows mistakes which are quite likely to be made by drilling on an overturned fold. If an outcrop of oil sand had been discovered at point *K*, the dip at the outcrop would coincide with *OM*, the axis of the fold. Unless the structure of the formation were known, it would naturally be supposed that the dip of the oil sand stratum was fully shown by the exposed rocks at point *K*. If well *G* were drilled the oil sand would be struck at point *I*, and the oil sand stratum would be penetrated lengthwise between *I* and *N*. This would lead to the erroneous conclusion that a very thick stratum of oil sand had been penetrated. If well *J* were drilled with the intention of striking the oil sand at *O*, it is obvious that the oil sand would be missed altogether. This illustrates the advisability of exhausting all the evidence in sight concerning the structural geology of a locality before wells are located.

It is quite probable that in many instances the dip of strata greatly increases at short distances from anticlinal axes. Moreover, as the axis of a syncline is approached the strata may be pushed over so that they dip backward towards the axis of the anticline, giving the fold a fan-shaped structure, as shown on the right in Fig. 4. If oil-yielding formations were folded in this manner, it is obvious that, although the oil sand might be struck at a reasonable depth near the axis of the anticline, as in the case of wells *A* and *B* (Fig. 4), a very short distance farther down the slope of the fold the oil sand might plunge to so great a depth that it could not be profitably reached by the drill.

Photographs of Folds.—Figs. 5, 6 and 7 illustrate the plication met with in the Coast Range. Fig. 5 looks like an upright fold, especially at the point photographed. Investigation showed that the strata forming the side of the fold on which the derrick is situated dip at a less angle than do the strata on the opposite side of the fold. The fold is, therefore, inclined. Fig. 6 is a good representation of an inclined fold. Fig. 7 illustrates the contortions to which rocky strata are subjected, and of which the overturned fold is a type.

Depth to Which Strata are Affected by Folds.—A question here suggests itself as to the depth at which the rocks cease to be affected by folds. It is evident that where the axes of the folds are close together strata inclined at a moderate angle could not extend to a great depth; but where the angle of the dip approaches the vertical the lowest portion of the inclined strata may be deeply buried. A simple calculation shows that in the case of folds the axes of which are 1200 feet apart, other things being equal, the greatest depth attained by strata dipping at 50°, 60°, 70° and 80°, respectively, would be: At 50°, 715 feet; at 60°, 1039 feet; at 70°, 1648 feet; at 80°, 3403 feet. In any case there is little doubt but that the smaller folds disappear as great depth is attained, and that strata in the zone underlying them are affected by greater folds, to which the smaller folds are secondary structures.

It is reasonable to suppose that compressed folds do not extend to a great depth in a uniform curve, but that the rock masses have been readjusted by reciprocal movement. Wherever there has been so much geological disturbance as is the case in the Coast Range it is evident that structural conditions must be modified, not only by faults and fractures, but also by the thinning or thickening of the softer strata, by reason of the compression to which they have been subjected.

Illustration of an Oil Field.—A suppositious case will illustrate the relation of anticlinal folds to oil lines. Thus, let Fig. 8 represent oil-yielding strata as *C C* and *O O* and the enclosing rocks thrown into an anticlinal fold, the axis of which extends between points *B* and *E*. *H H* is the line of outcrop or the line along which the oil sand comes to the surface. An examination of this outcrop and a study of the geological structure of the formation would enable operators to determine a suitable point at which to sink their first well. The derricks shown in this illustration indicate that an oil line has been developed on the east side of the fold. It will be observed that the oil line runs parallel to and at no great distance from the axis of the fold.

Distance *D A* represents the breadth of the oil line, which is supposed to in-

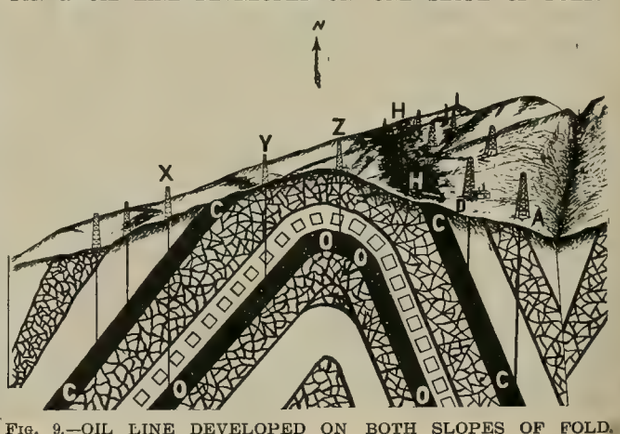

FIG. 9.—OIL LINE DEVELOPED ON BOTH SLOPES OF FOLD.

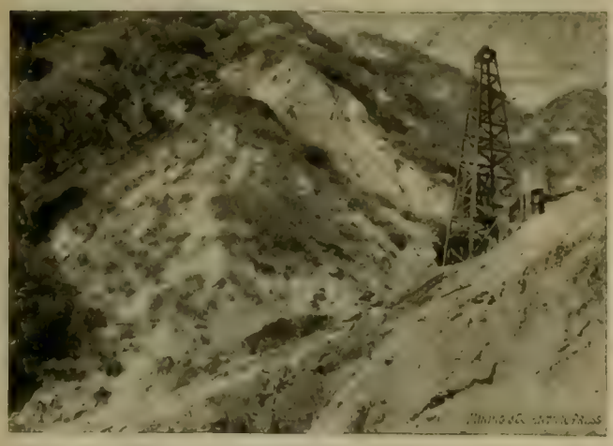

FIG. 5.—FOLD AT MODELLO OIL WELLS, VENTURA CO., CAL.

clude only two rows of wells, for east of point *A* the oil sand might lie too deep to be profitably reached by the drill. If investigations showed that the geological formations had been thrown into a fold, such as that shown in Fig. 8, and an oil line had been developed on the east side of the fold, it would be reasonable to expect the existence of a similar oil line on the opposite or west side of the fold and that, like the oil line on the east side, it would run parallel to and at no great distance from the axis of the fold, as shown in Fig. 9. On the west side of the fold the angle of the dip is less than it is on the east side. Therefore, the oil line is wider on the west than on the east side of the fold, thus permitting more than two rows of wells to be drilled with profit.

In order further to prospect the territory, well *X* might be deepened, and a second stratum of oil sand discovered. It is obvious that a discovery of a second oil sand would greatly increase the value of the territory, for not only might wells be drilled, which would tap both strata of oil sand, but remunerative wells such as *Y* and *Z* might be drilled and derive their oil entirely from the second oil sand. It might be that while one side of the fold furnished valuable oil territory, the formations on the other side might be so crushed and broken that remunerative wells could not be obtained; or, as shown in Fig. 10, the oil line might be cut in two by a fault, or a part of it might have slipped down to too great a depth for the oil sand to be reached by the drill.

As previously mentioned, the dark line *H H* on the east side of the fold represents the outcrop of oil sand with seepages of oil. On the west side of the fold the slope of the hill is supposed to be covered with alluvium. The line of outcrop of any stratum is the line along which it comes to the surface.

In prospecting for petroleum or any other mineral the outcrop is a most important guide. Thus, supposing the black line *H H* to be the oil sand, an examination of the outcropping stratum would show the direction in which the oil sand extends, and the angle at which it dips or is inclined. Consequently, the depth at which the oil sand could be struck by drilling at any distance from the outcrop might be calculated. When, however, the exposed rocks are situated near the axis of a fold, or the fold of which they form a part is overturned, they are by no means an infallible guide as to the prevailing angle of the dip. In locating an oil well the character of the fold affecting the rocks about to be prospected should be taken into account, as demonstrated by the type folds described in this paper.

In most instances, however, only glimpses of the outcrop can be obtained. As in the case of stratum *O O*, the oil sand may be covered by a great thickness of overlying rock, and the existence of oil-yielding formations may be indicated only by an oil spring, or they may have been accidentally discovered by drilling. When such buried oil-yielding formations have been discovered on any particular fold, and the position of the oil sand with regard to the enclosing rocks has been determined, the probable course of the oil lines may be ascertained by tracing the course of the fold. It is quite important to ascertain whether or not the oil sand lies conformably beneath the rocks which cover it; or, in other words, whether or not the oil sand is folded in the same way as the rocks which are exposed at the surface. In hills and mountains, however, it is more than likely that the prospector will be assisted by glimpses of the oil sand in ravines and canyons, where the overlying rocks have been cut through by erosion.

Faults May Form Oil Lines.—There are structural conditions of the rocky strata besides that of folding which may determine the existence and the course of oil lines. The most important of these are faults. As there are many who may not have studied structural geology, it might not be out of place to say a few words on that subject.

Faults are breaks or displacements in the rocky strata, whereby blocks of the earth's crust have been elevated, depressed or pushed over one another. Where only depression or elevation has taken place, they are called normal or gravity faults; where pushing over has occurred, they are called reversed or thrust faults. The fractures are occasioned by the stretching or compression of the rocky strata. In the case of thrust faults, the controlling power is the thrust or stress occasioned by the compression; and, in the case of gravity faults, it is the force of gravity.

In areas of great compression, like that of the Coast Range, it might be supposed that all the faults would be thrust faults; but in many instances the fracture which occasioned the fault is nearly vertical to the plane of the horizon, in which case the force of gravity in many instances controls the thrust.

The class of faults most likely to result in the formation of oil lines are those which have been caused by fractures extending in the direction of the strike of the formation, and which have allowed blocks of the earth's crust to slip past one another so that they are arranged in the form of steps.

Let Fig. 11 represent a series of rocky strata enclosing a stratum of oil sand, the dip being at an angle of about 30°. If well *Z* is 2000 feet deep, the oil sand west of this well would be too far below the surface to be profitably reached by the drill. Let us suppose that, owing to fractures at points *B* and *D*, a fault was formed by block *B D* slipping down, as shown in Fig. 12. When erosion has worn away the surface, as shown in Fig. 12, two oil lines might be formed, and the oil might be reached by wells of moderate depth between points *E* and *B*, as well as between *B* and *D*.

In Fig. 12 a gravity fault is used for purposes of illustration, and it will be observed that the fracture slopes toward the block which has slipped down. Thrust faults, when the fissures which formed them are nearly vertical, might produce similar results, so far as the multiplication of the oil line is concerned; but in the case of thrust faults the fractures would slope toward the block which has been elevated. When faults are close together the rocks are likely to be so crushed that the oil line has been destroyed.

Lines of geological disturbance may show faults at one point and a well marked fold at another. The question of faulting or folding is determined by the character of the rocks, the thickness of the strata, and the conditions to which it is subjected. In the movement which occasioned the faulting or folding, other things being equal, deeply buried strata are more likely to be folded than to be fractured or faulted; while with less deeply buried strata the reverse is the case; and beds of soft material are likely to be more crumpled and folded at an acute angle than are harder rocks.

Folds and Crossfolds.—In many localities the rocks are found to be affected by more than one order of folds. In most instances we find dominant folds which have controlled the prevailing strike and dip of the formation, and crossfolds which have a different strike to that of the dominant folds. At points where the crossfolds strike the axis of the dominant folds, the tendency is to form domelike elevations or to occasion a great complexity of geological structure by plication and fracture.

Complex Structure Demands Careful Study.—The foregoing remarks on structural geology are sufficient to indicate the structure which in most instances controls the course of oil lines in a country where the geological formation has been much disturbed.

So far as observation has been made, the oil lines in California are governed by structural conditions, such as are mentioned in this paper. A continued study of the development of our oil fields will still further show how nearly the facts disclosed by the drill conform to the recognized types of geological structure; and a record of such observations cannot fail to be beneficial to the development of the petroleum industry.

Where the rocks are closely folded, as they are in most of the oil districts of California, drillers are likely to meet with anomalous experiences, owing to faulting and shifting incidental to the rearrangement of rock masses, and this necessitates extended observation and great care in making deductions.

Oil Lines May be Followed Into the Valleys.—The folds and geological structures to be seen in the hills and mountains where the rocks are exposed do not necessarily terminate in the uplands; they also extend beneath the alluvium of the valleys. Oil lines that have been discovered in the hills and mountains may be followed into the valleys where the rocks are covered with alluvium.

It is to be expected that oil lines in countries where there has been much geological disturbance would be broken and of irregular extent; this is found to be the case in California. In this State the longest unbroken oil line yet developed is that of Second Street Park, at Los Angeles, which is a little more than a mile in length.

The Business Risks of the Oil Prospector Classified.—The business risk of prospecting for oil varies greatly. Oil prospecting propositions may be divided into two orders:

First, the "orthodox" proposition. In this case the prospectors have in view a definite oil-yielding stratum, which has proved remunerative in adjacent territory, and from which stratum they expect to obtain their oil. Moreover, they have sufficient geological evidence in sight to warrant the assumption that the oil stratum they have in view forms an oil line through the territory they are about to prospect.

Second, the "wildcat" proposition. In this instance the prospectors have no definite oil stratum in view which has proved remunerative in adjacent territory, or they have not sufficient geological evidence in sight to warrant the assumption that an oil-yielding stratum, which is known to be productive in adjacent territory, forms an oil line through the land they are about to prospect.

In prospect wells of the first order the least risk is taken where the outcrop of an oil sand, which has proved remunerative in a certain oil field, can be actually traced through the territory to be prospected, and the geological structure of the locality is known.

More risk, however, is undertaken where there is no outcrop of the oil sand, although the strike and dip of a remunerative body of oil sand in an adjacent oil field are known, and the rocks overlying the oil sand can be traced to the territory about to be prospected. When an oil line has been developed on one side of a fold under conditions shown in Fig. 8, and an outcrop of oil sand has been discovered on the other side of the fold, propositions to prospect this

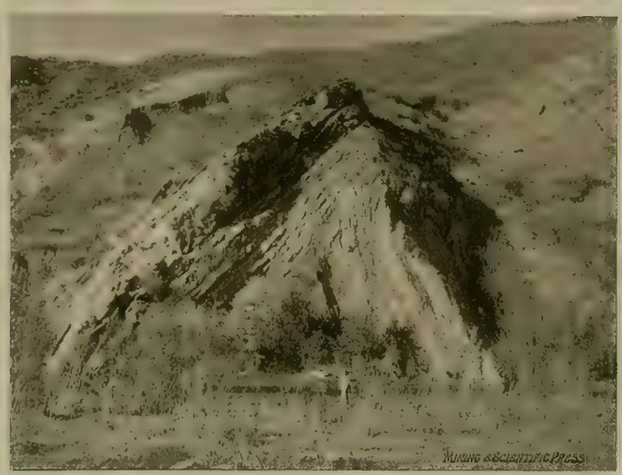

FIG. 6.—FOLD ON PIRU RANCH, VENTURA CO., CAL.

FIG. 7.—PORTION OF RECUMBENT FOLD, SAN PEDRO PENINSULA, LOS ANGELES CO., CAL.

side must be classed among the more risky "orthodox" propositions.

Most oil mining enterprises which have for their object the development of new territory, especially when operations are conducted at a distance from any known oil field, are "wildcat" propositions. Some idea of the conditions regulating the amount of risk involved in such enterprises may be gathered from the following statements:

The least risky "wildcat" proposition is the case in which the strike and dip of a remunerative stratum of oil sand in an oil field adjacent to the territory about to be prospected has been ascertained; and although there is no further geological evidence in sight, it is found after carefully platting a map of the territory that if the stratum of oil sand were extended in the direction of its strike, without any material alteration of the angle of the dip, it would

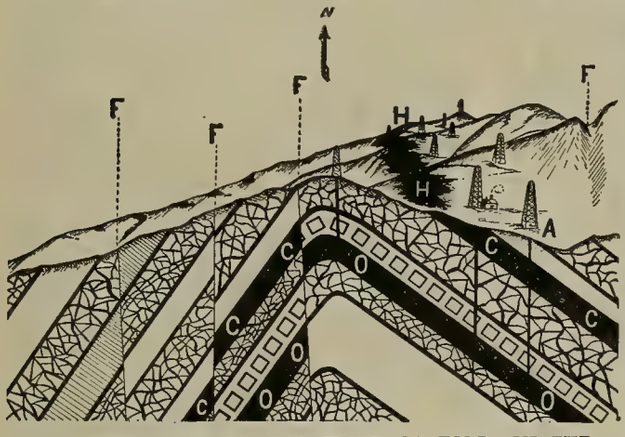

FIG. 10.—OIL LINE ON ONE SLOPE OF FOLD, ON THE OTHER DESTROYED BY FAULTS.

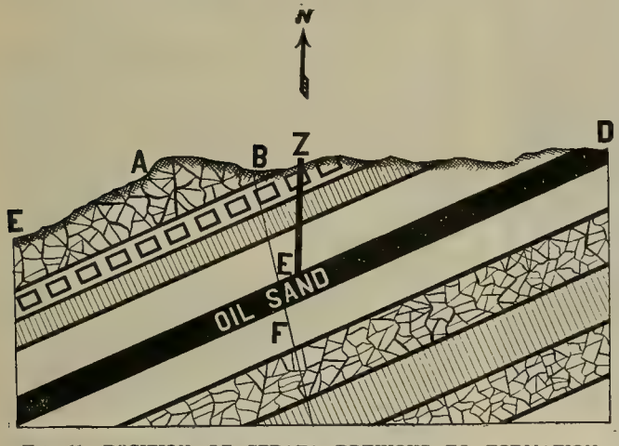

FIG. 11.—POSITION OF STRATA PREVIOUS TO FORMATION OF FAULT.

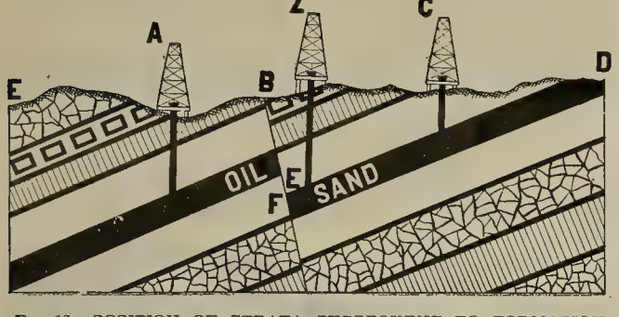

FIG. 12.—POSITION OF STRATA SUBSEQUENT TO FORMATION OF FAULT.

form an oil line across the territory to be prospected. It is a more risky "wildcat" proposition to prospect the side of a fold opposite to that on which an oil line has been developed (as shown in Figs. 8, 9 and 10) in cases where surface indications warrant the assumption that the same sequence of formation exists on both sides of the fold, and yet no outcrop of oil sand has been discovered on the side about to be prospected.

It is a still more risky "wildcat" proposition when a stratum of oil sand has been discovered, concerning which nothing is known except that the sand gives evidence of containing oil, and a well is sunk for the first time to determine whether or not the oil sand contains oil in remunerative quantities.

It is a much more risky "wildcat" proposition where no outcrop of oil sand has been discovered, but where a well is sunk in a certain formation because it shows some irregular seepages of petroleum, or because the formation appears to be similar to that containing a remunerative body of oil sand in other places.

It is well for oil prospectors to study the risk they are about to take before expending money, and care should be taken to control sufficient territory that they may have sufficient room to develop their oil field, in case their venture proves successful. No one should undertake the more risky forms of prospecting unless he can well afford to lose the money to be put into the enterprise.

(To be Continued.)

Boring by Diamond Drill.*

By J. T. COLE.

A recent announcement had been made that the boring on the Murray Flats, initiated at the joint expense of the Victorian and New South Wales Governments, has been abandoned and the apparatus removed. The cause suggested is the cost of the work. During the last few years I have had considerable experience in diamond drill boring, inasmuch as I put down a couple of bores on the Charters Towers gold field to depths of 3006 feet and 1660 feet respectively. The strata pierced consisted mostly of granite of adamantine hardness, with a few reef formations or channels at intervals. In places the granite was full of heads and joints, and it was here that at first I lost a few of the diamonds by fracture. I then adopted a different system of setting the diamonds in the boring crown. Instead of setting the stones at regular distances in the face of the bit or crown I fixed them in groups of twos or threes, closer together than is usually the custom, leaving between the groups spaces of sufficient area to put in four plugs or pins of iron. These were firmly tamped in and left a shade long, so as to project a little beyond the exposed portions of the diamonds. The result of this is, that before the diamonds come into operation the iron plugs are gradually worn away until each diamond comes into work without undue prominence, and the risk of fracture when coming into contact with the hard jointy rock is thus obviated.

For some time past the price of Brazilian carbons and borts have been almost prohibitive, specially selected stones costing as much at £8 per carat, and during the few years I spent a lot of time trying to find a substitute for Brazilian stones. For a long time I was in constant communication with diamond mine owners and diamond buyers in Bingara, Inverell, and Boggy Camp (N. S. W.), and I constantly received samples from these places. Unfortunately, the bulk of the stones from the New England mines are very small, very few individual stones weighing 1 carat, and the greater proportion of them were full of minute feathers or flaws. Captain Rogers, of Bingara, and Mr. Dasey, of Boggy Camp, supplied me at different times with at least 100 stones, weighing in the gross about 50 carats, the largest being 2¼ carats in weight. Out of these I had, perhaps, twenty really excellent stones. Though somewhat small for drill purposes, the hardness was undeniable, and here I may mention that in the Brazilian product it is not only the hardness, but the toughness or temper, that makes them so reliable for this class of work. Rough stones from other parts of the world are frequently just as hard, but have not the temper, and, like a too hardly tempered tool, fractures and chips when brought into work. The highest price I gave for these Australian stones was, I think, 26s. per carat. While on this subject I may proffer an opinion that I believe it is quite possible that in the search for gem stones a great many excellent stones for drill purposes are overlooked and thrown away, as this class of stone has neither the brilliancy nor the satin-like appearance of the rough gem stone used for jewelry purposes.

Failing to obtain a sufficient supply of Australian stones, I turned my attention to the hardening of steel, and though I tried electrical hardening and other modern methods, I could not attain anything equal to the hardness of tool steel, manganese steel, which is non-magnetic and unannealable, or the natural chrome steel of Tasmania. I am aware that steel is extensively used as the boring tool in drills, with considerable success, in the sandstones, slates, and shales of coal formations, and at times even in the softer basalts, and if some time be given to experiments in the hardening of steel or other metals, with the view of finding a cheap substitute for diamonds, it is within the range of possibility some alloy or combination of metals might be found to serve the purpose.

One possible reason that steel when in work in a bore so very soon loses its hardness or temper is, I think, the vibratory action on the steel bit when revolving causes the steel to become polarized, and as soon as this takes place the original hardness is lessened, and the tool quickly becomes useless. This, to a slight degree, can, I think, be prevented by having the lower coupling piece of the core barrel constructed of tough gun metal or other metal of a non-magnetic nature. Years ago, on one of the first drills imported into Victoria, and used under the direction of Mr. Griscombe, an American diamond drill expert, we set up several bits with natural chrome steel instead of diamonds, but failed to do any good, as we allowed the drill to revolve at too great a speed, and the Kilcunda sandstone simply wore away the steel like a grindstone does a chisel. Since then it has been discovered that if a similarly set tool is revolved very slowly the hard steel disintegrates the atoms of the sandstone and the tool lasts for a considerable time.

The above question is one of such grave importance to the mining community generally that I make no apology for offering these ideas or suggestions to the authorities having the direction of the boring operations in these colonies, and I think the mining men of Allendale are wrong in their opinion when they state that the drills are old-fashioned and obsolete, for I am aware that the Victorian Mines Department has kept entirely up to date in any improvements that have been brought forward for many years past. The only alteration would serve to make the machinery portion of the business a success is that the diamond drills should certainly be geared, so that a slow and powerful motion, well under control, should be designed, and thus give the departments opportunities of experimenting with steel or other likely substitutes for the expensive diamond.

* Condensed from *Australian Mining Standard.*

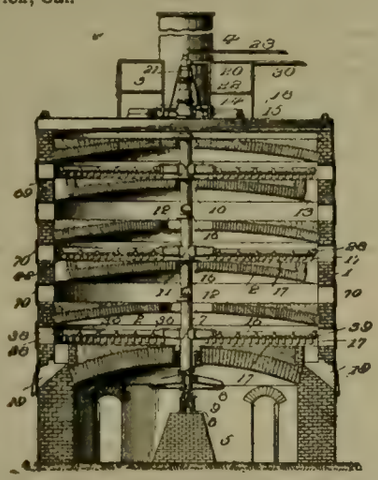
Accident at the St. Lawrence Mine, Butte, Montana.

TO THE EDITOR:—On July 19th there occurred a serious accident at the St. Lawrence mine, one of the properties of the Anaconda Copper Mining Co., at Butte, Montana, resulting in the almost total destruction of the right-hand reel of the large hoisting engine at this shaft, and the complete demolition of the double-deck cages, and the five-ton skip that was hung under them, as well as the ruin of the 2700 feet of cable, which was hopelessly kinked and snarled in its fall. Fortunately there was no loss of life, although two men were quite seriously injured, and all things considered, the property loss was small, the damage being confined generally to the wrecked reel and the front of the building.

The accident was caused by the end of the floating lever attached to the valve mechanism of the right-hand brake engine being disconnected from the link connecting it with the hand lever, while some minor repairs were being made, and when the machinist went to connect up again, he lifted the end of the floating lever, thus admitting steam to the brake engine, and releasing the brakes, whereupon the cages, which were hanging in the shaft without being on the chairs, started down the shaft, and had gathered such velocity before the runner could reach the platform from the floor (where he was occupied at the time) that it was found impossible to catch the runaway reel with the friction clutches (which were not in gear at the time that the reel started), and the reel quickly attained a rotative speed that was sufficient to destroy it, throwing the fragments of the outer rim and the light reel arms all over the front of the engine house, tearing the brickwork out, breaking the massive front brake post and the bed plate that it was anchored to, wounding two men who were seated on the outside of the engine-house, and finally parting with the rope that was torn free of the bolt in the reel center, the slack end of the rope demolishing the railings and floor plates at the head of the steel head frame and going down the shaft in a hopeless tangle of steel wire and tar.

Calculation would indicate that the speed of the reel, as the cages neared the bottom of the shaft, must have been not less than about 350 revolutions per minute, a speed that no wheel 16 feet in diameter could stand, and the comparatively small amount of damage is a matter of surprise and congratulation.

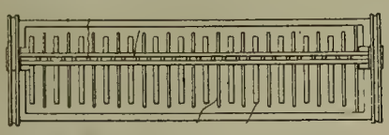
Butte, Montana, July 22nd, '99.



A GREAT scarcity of pig iron and ore has developed in Cleveland and dealers are not trying to sell iron for shipment before January 1st next, and none can be had for shipment sooner than September 1st. The output of the Lake Superior iron mines is large but the development of the various iron districts has not recently kept pace with the increasing demand and the metal is daily becoming more scarce.

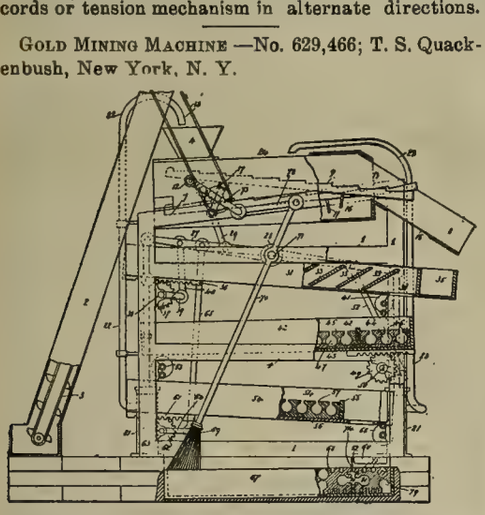
Latest Mining and Metallurgical Patents.

Patents Issued July 25, 1899.



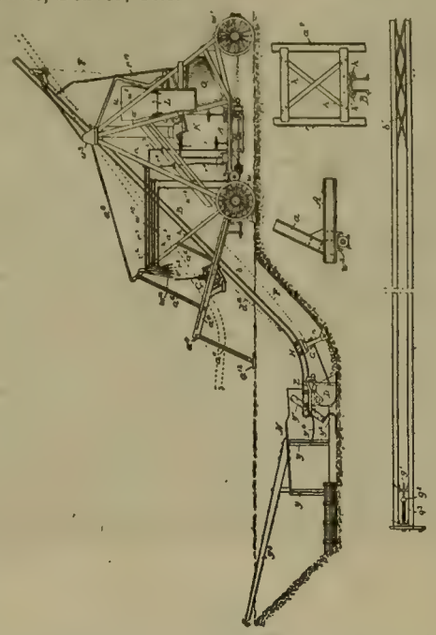
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ROASTING FURNCE.—No. 629,023; L. T. Wright, Keswick, Cal.



A roasting furnace, the combination, with a series of floors, of a central hollow shaft, hollow arms carried thereon over the respective floors, an open-bottomed pipe inserted in shaft, an intermediate closed-bottomed pipe in shaft into which the first pipe discharges at the bottom, open-ended pipes leading from the intermediate pipe into the hollow arms, and feed and exhaust pipes connected to the first pipe and hollow shaft; a spider between the first pipe and the shaft, supporting, closing the top of, the intermediate pipe, open-ended pipes leading from the intermediate pipe into the hollow arms, and feed and exhaust pipes connected to the first pipe and the hollow shaft; sleeves secured to the shaft, hollow arms having their ends inserted in sleeves, and threaded outside sleeves, threaded collars on threaded portions and secured to sleeves, and a feed pipe for supplying water to hollow shaft and arms.

APPARATUS FOR ELECTROLYSIS.—No. 629,043; J. T. Morrow, Great Falls, Mont.

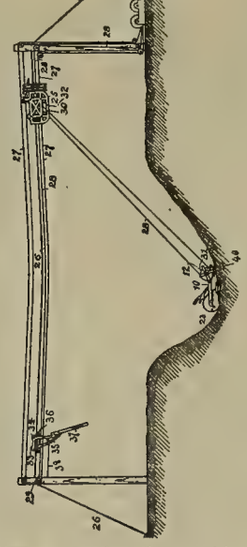


In combination with an electrolytic tank and with the anode and cathodes thereof, a reedboard, a series of reeds supported therefrom, and mechanical means for moving the reedboard to and fro transversely. Guideways and guides for transverse movement of the reedboard, one or more cords or other tension mechanism and rollers and means for actuating the cords or tension mechanism in alternate directions.

GOLD MINING MACHINE —No. 629,466; T. S. Quackenbush, New York, N. Y.

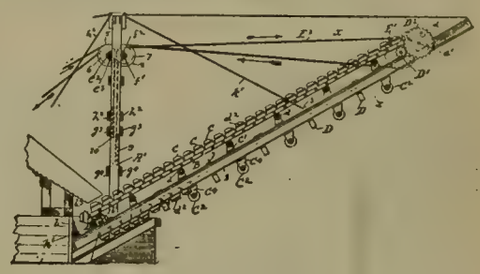
A machine for treating ores, a separating mechanism comprising a box or casing having an inclined bottom and carrying rackbars arranged in longitudinal parallel position, and a transverse shaft having oppositely projecting cranks connected to the respective rackbars, the rackbars being provided with pins or fingers projecting from their lower edges with respect to the inclined bottom and having their free ends opposite the carrying cranks provided with a smooth or unobstructed bottom edge which slides over and is supported upon the edge of the upper end of the box or casing on a plane above the inclined bottom of the latter, whereby the rack of the top edge of the bars feeds from the upper end of the casing and the projecting bottom fingers feed in a reverse direction downwardly to the lower end of the inclined bottom of the casing.

EXCAVATING APPARATUS.—No. 629,576; H. C. Lowrie, Denver, Colo.



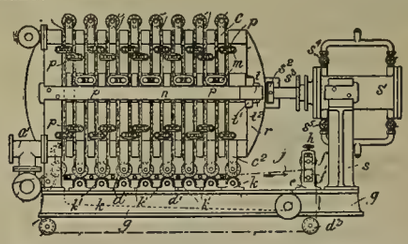
An excavating apparatus, the combination of an incline having a scoop or other earthworking tool or tools supported and guided thereby and adapted to travel thereon, means for controlling the earthworking tool or tools, and means whereby the incline may be adjusted longitudinally without varying its inclination, and its inclination varied without varying its longitudinal adjustment.

LAMP BRACKET FOR MINERS' CAPS.—No. 629,692; T. R. Jones, Wilkesbarre, Pa.



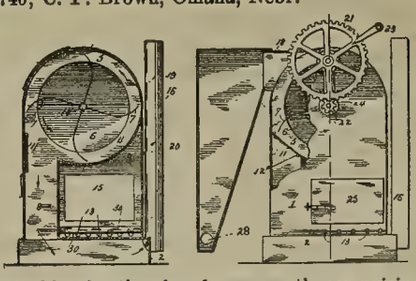
A lamp bracket for miners' caps consisting of a plate adapted to be vertically arranged in front of the cap and having its upper and lower ends adapted to be secured to the crown and peak thereof respectively, plate having a rearwardly and downwardly bent portion near its upper end, a longitudinal slot in its upper portion extending through bent portion and a perforation in the rear of the bent portion and in line with the slot.

EXCAVATING AND CONVEYING APPARATUS.—No. 629,695; F. B. Knight, New York, N. Y.



A digging scoop bucket, in combination with a series of teeth arming the digging edge of the base thereof and a tooth arming the digging edge of each side thereof adjacent to the base; each of said side teeth being double plow-shaped and having its point directed in a line diverging from the side line of bucket; a rigid bail, means whereby bail is rigidly held in a fixed position with respect to the body of the bucket except when the same is dumping, a pivotal connection with the forward end of bail which constitutes the point of draft in digging, point of draft being immovably located forward of a plane extending from the extreme forward digging teeth connected with bucket perpendicular to the base plane of bucket.

ELEVATOR FOR GOLD DREDGERS.—No. 629,602; R. H. Postlethwaite, San Francisco, Cal.



The combination with a platform and an endless carrier or elevator movably mounted, of a sheave E' for imparting motion to the elevator, a drive drum E', sheave on platform out of alignment with sheave or upright sheave frame on the platform, a series being adjustable toward and from the others and a single cable for transmitting power from the drive sheave to the sheave E' working on sheaves and on the series of sheaves in frame. A drive sheave E^2 out of alignment with and whose axle is parallel of the sheave E', a sheave frame between sheaves 9 and 10, one of which is vertically adjustable mounted on frame with their axles at an angle to the axles of sheaves E' and E^2, sheaves 5, 6, 7 and 8 mounted on frame with their axles parallel with the axles of the sheaves E' and E^2, and a single endless cable passing over sheaves. The combination of the ladder, an endless carrier working thereon comprising a series of buckets each provided with side flanges, supporting rollers for the carrier mounted on the ladder upon which rollers side flanges rest, and drive means. A support, with an endless carrier thereon having a series of buckets each having in addition to the carrier a fixed supporting surface, a series of rollers for supporting the under run of buckets and with which the supporting surfaces engage, and means for driving the carrier.

FILTER PRESS.—No. 629,642; J. Wilson, Glasgow, Scotland.

A filter press, the combination with the filtering frames carrying at one end rollers for the passage of the filtering cloth, and plates provided at opposite ends with rollers for the passage of the filtering cloth; of means for moving the filtering cloth, and means for cleaning the same. The combination with a cylinder, and a piston working in cylinder, piston having an extension through the rear cylinder; of a swinging block in rear of cylinder, and a screw carried in swinging block to engage the end of rearward extension of the piston rod, for securing the piston at the end of its forward stroke.

HEATER FOR THAWING FROZEN EARTH, ETC.—No. 629,740; C. P. Brown, Omaha, Nebr.

A machine for thawing frozen earth comprising a casing having therein a heating chamber with an open bottom and closed sides and a smoke pipe, and having therein over and next to the heating chamber a combustion chamber, and above the combustion chamber a drum, a passage connecting the combustion chamber and the drum, a passage connecting the drum with the heating chamber, and a fan in the drum for drawing the products of combustion from the combustion chamber and forcing them through the heating chamber, and means for operating the fan.

Some Experiences of a Working Miner,

NUMBER XXVII.

Written for the MINING AND SCIENTIFIC PRESS.

The I—— H—— mine was a success and paid dividends to its stockholders. It was fortunate in having a practical, common sense manager, who knew the difference between ore and waste and also the difference between a capable man and one who was not. His wisdom showed itself in the employment of men to superintend the various branches of the enterprise, each of whom was well chosen for the duties he was called upon to perform. This is a very important matter to mine managers. One man can not do all the work nor look after all its details personally. One day at the P—— mine I saw the high-priced superintendent assisting in unloading a wagon load of pipe, while twenty of his laborers stood about, helplessly looking on with their mouths open, while a foreman sat astride a horse, offering suggestions. You may rest assured that M——, who was manager of the I—— H—— mine, was not that sort of a manager. He had men employed to handle pipe, logs and heavy machinery; but he didn't handle it himself, as his time was worth more in some other capacity than that of laborer. He was not afraid of work when work was necessary, for one day a top man rushed breathlessly into the office and shouted that a bad cave had occurred in the mine. M—— ran to the mine and descended on the cage, without stopping to change his clothes. He stood there and gave directions and took a hand himself, reassuring his men by his confidence and presence, and in a few hours what had been a very dangerous job was safely completed and the danger was past. He knew just what should be done, issued his orders calmly, but positively, and the men could plainly see he understood his business, and entertained a greater respect for him than before. The I—— H—— main shaft started in a barren formation, but reached a large and valuable ore body in depth. The success of the mine naturally stimulated prospecting all about the neighboring region, and numerous companies were organized and shafts started, without sign of mineral of any kind, and most of them failed to find anything of value below. One company, the M—— Consolidated, started a shaft and put up a fine plant. For more than 200 feet the shaft passed through barren material and was still without ore. One of the directors of the company retained me to make an examination. We went to the mine and, after looking about for a short time, I inquired what was the object of the shaft. I was informed that it was for the purpose of opening a mine like the I—— H——.

"But you have not got here the same formation," I explained; "you are too low."

"Too low!" exclaimed the M—— man. "How's that? We are at least 100 feet higher here than the I—— H—— shaft."

"Yes," I replied; "so you are. Your shaft starts at a higher altitude than the I—— H—— shaft, but the formation which their shaft was sunk to reach and in which they find their ore body is not here at all. It laid at a higher geological horizon and the limestone has all been removed by erosion, and you have sunk 200 feet below the lowest portion of their ore-bearing stratum."

This was news to him, but it clearly demonstrated the foolhardiness of blindly sinking a shaft without first having an examination made to ascertain its advisability.

* * *

Often while working at the P—— mine I would take a shotgun or rifle and stroll out into the wilderness of the mountains, sometimes going several miles. Game was not abundant nor altogether lacking. There was also quite a variety of it, even though scarce. Jackrabbits were most common, but when a fellow went hunting them he was quite as likely to find a bear. On these trips I often noticed the peculiar flinty, nodular masses in the limestone and lying loosely about the surface, but paid little attention to them. I had been taught that flint was a most unlikely material in which to find gold, and I do not remember having ever picked up a piece and giving it even a casual examination. I left the P—— mine, and forgot all about the flint; but one day a farmer, who is supposed to know more about hay and potatoes than gold ore, was out prospecting in this limestone country and the poor innocent picked up a quantity of this flint. He knew so little about it that he even paid to have it assayed, and it carried about ten ounces of gold to the ton. He gathered up a lot of this miserable flint and shipped it to the smelters and now he is said to be rich. The only satisfaction I can derive from this is that I was not the only miner who had looked with disdain upon the flint cropping from the limestone. Since then I have seen several places where these chert-like nodules of silica in limestone were rich in gold and silver. I prospect everything now.

* * *

There are numerous instances where prospectors seem to have been guided by some fate to the spot where wealth would reward a very small effort. Although luck seems to be a very important element in the success of a prospector's career, it should always be remembered that the man who discovered a mine and is called lucky did not find it sitting around home. He was out scouring the mountains, creeping the brush or climbing over piles of boulders in search of a vein.

L—— and R—— were out on a trip searching for a vein which would make their fortunes, but would have been satisfied with anything in which there was some pay. For days and weeks they hunted the hillsides, and, though they discovered numerous veins, none were rich enough to induce them to work. Each morning they would get up, start off and tramp, one going in one direction, the other in another. Nightfall found them back at camp with their bags full of rocks from the veins found during the day. L—— had been up at B—— creek three different times, but found nothing. He went the fourth time, and, by the merest chance, decided to go up the mountain toward a red spot he could see from the gulch, and there he found a vein a foot wide. He took a small quantity of the ore down to the creek and washed it in a hornspoon. It was a fine prospect; he hastened back to get a little more of it and investigate a little closer. He found the vein on the opposite side of the little gulch, and samples from there also prospected well. They moved their camp to the locality next day, worked a little on the vein, and finally started for the nearest town, nearly 100 miles away. Their rock proved to be rich; they were soon shipping it by the carload, and each made a fortune. Now, luck favored these men, but they would have had no such luck had they remained in town, finding fault on account of their bad luck.

MINER.

Hawaiian Island Volcanoes.

The eruption of Mauna Loa and Kilauea now in progress on the island of Hawaii make the geological structure of those islands of unusual interest at this time. Capt. C. E. Dutton, in the fourth annual report of the United States Geological Survey gives a lengthy and interesting description of the Hawaiian volcanoes. The following is from that report:

There are twelve islands in the Hawaiian group, all of them volcanic. Four of them are mere barren rocks, four are large islands, the remaining four being inferior in size but habitable. All of the large ones are lofty and mountainous. The culminating peaks of the island of Hawaii, the largest and most southerly of the group, are Mauna Loa, 13,700 feet, and Mauna Kea, 13,900 feet. The summit of Haleakala, on East Maui, is 10,350 feet in altitude. All of these elevations are in relation to sea level. Hawaii is ninety by seventy-four miles and contains 3950 square miles; Maui is forty-eight by thirty miles, and Oahu is forty-six by twenty-five miles. The city of Hololulu is on the southerly side of the latter island.

Soundings about the various islands have determined that these volcanic piles are only the summits of gigantic mountains rising above a comparatively level region on the floor of the Pacific ocean. These soundings have determined that the slopes of the mountains as seen above sea level continue at slightly increased angle for a distance of thirty to fifty miles from the shore and range from 14,000 feet to 19,000 feet in height before sea level is reached, which on adding the additional altitude above sea level gives them the great altitude of about 30,000 feet.

Mauna Loa (the great mountain) is the largest mass of volcanic material in the world. In other lands there are more lofty volcanic mountains but these stand upon elevated platforms and are comparatively diminutive cones. Regarding the platforms as the base, these cones of lava do not begin to equal Mauna Loa. Mount Shasta, Mount Hood and Mount Rainier, melted into a single mass, would still be far inferior to the Hawaiian volcano.

Mauna Kea (the white mountain) is also a colossus among volcanoes only exceeded in size by its neighbor, Mauna Loa. Mauna Kea is 200 feet higher but is steeper and not so broad of base as Mauna Loa, which at sea level is seventy-four by fifty-three miles. Iceland volcanoes have in times gone by erupted an equal amount of material, but not within a century. At a single eruption Mauna Loa has been known to send forth more lava than Vesuvius has since the days of Pompeii. Mauna Loa and Kilauea, near it, are noted for the singularly quiet character of their eruptions. (The latter is the crater famed for its lake of fire.) Only rarely are their eruptions preceded by violent earthquakes and subterranean rumblings. Those vast jets of steam blown miles high, hurling stones, cinders and lapilli far and wide, so common to volcanic eruptions are almost unknown here. There is something of the sort but only in a feeble sort of way. The lava rises in these craters, and passing over the rim, flows down the mountain slope for miles, and on numerous occasions has reached the sea. The absence of cinder cones is noticeable. Their summits are broad flat tables with deep pits sunken into them.

There are cinder cones at Mauna Kea and on other volcanoes on the north end of the island. All of the lava is basaltic, and contains a large amount of olivine. The entire slope of Mauna Kea is covered with these symmetrical cones, all of which have truncated tops showing the presence of the central crater. Some of them rise to a height of 1000 feet and are about three-quarters of a mile broad at the base. The slope of Mauna Kea varies from twelve to twenty degrees, while that of Mauna Loa is from four to seven degrees. Mauna Loa is wholly built up of successive lava flows and Mauna Kea of fragmental material.

The islands at the northern end of the group have not been disturbed by volcanic eruptions for thousands of years, as evidenced by the lack of fresh lavas. The surface rocks have decayed and disintegrated into soil and the islands are noted for the luxuriance of the tropical vegetation. Even Mauna Kea has been inactive for a long period, and a rank growth of grass clothes the volcano to near its summit. This grass is long and coarse and of light straw color, giving to the mountain a light color, to which is probably due its name.

Dredging in New Zealand.

The success that has attended dredging enterprises in New Zealand is now turning a large amount of local attention to its more energetic prosecution. Its general effect upon the production forcibly appears in the official returns of export for April. The total for that month was 33,343 ounces, valued at £130,509, as against 15,220 ounces, valued at £56,948, for the corresponding month of last year. This means that gold production was more than doubled, and by the official return the increase is largely attributed to the progress of the dredging industry. It is worthy of note that in the April number of the New Zealand *Mines Record*, a Government publication, a return is given of the yields obtained by thirty-two dredgers, the total being in round numbers 3120 ounces. This stands for but a small proportion of the 18,123 ounces of general increase, but it adds force to the common assertion that but a limited amount of the gold obtained by dredging is reported for publication, the disposition being to conceal, rather than to proclaim, results. In further support of this presumption, it may be mentioned that in the fuller returns of export for the the quarter ending March 31, 1899, the total yield from the Otago province, where the majority of the dredgers are working, is 37,642 ounces out of a gross total for the South Island of 57,598 ounces, and for the colony of 92,818 ounces. This shows that the dredging province alone has returned more than all the northern gold fields, notwithstanding the heavy and constant yields of such mines as the Waihi, Waitekauri, Crown and Talisman. Besides this fact, the reported return for April of 3120 ounces from thirty-two dredgers will apparently stand some supplementing, so the local men evidently think, therefore there is a dredging boom in present progress which threatens to develop rather large proportions. Sections to be worked under lease, should leases be granted, are being marked off in every direction. Among them, no doubt, are sections that never will be worked, except on the share market, whether leases are granted or not. It is even reported that it is intended to float a company with a capital of £200,000 to take up Lake Waihola and work it with a fleet of dredgers. Company promoting is proceeding in the usual reckless manner that always follows upon a mining success. A Wellington contemporary says: "Before the prospectus of Alpine No. 2 Gold Dredging Co. was issued, the whole of the shares (4800) available for subscription were taken up. As a favor, one speculator in Wellington secured 100 shares, and before he had actually signed the application form he was offered a premium of 2s 6d per share on which he had paid nothing. The Moa Flat Dredging Co., with a capital of £10,000, was floated in Dunedin in the course of a few days, and the Central Electric Co., with a capital of £7000, was floated before the prospectuses reached the public. Of these shares, 500 were reserved for sale in Wellington. Immediately following the letter of advice, a telegram was received by the broker quoting the shares at a premium of 6d. Considering the enormous capital issued during the past three months in Dunedin for dredging purposes, the consumptive power of the speculators in the southern cities must be regarded as marvellous." Herein is suggested both the desirable and the undesirable proportions the industry may develop in Australia. The New Zealand Government officially states in its last issue of "Papers and Reports Relating to Minerals and Mining" that no great damage is done to the land by dredging, but it can be harrowed and grass sown again, if necessary; that the streams are not polluted to any extent, nor filled up with gravel; that the whole material can be raised, washed and deposited again with very little eventual surface damage. This is scarcely calculated to restrain dredging operations, nor does it indicate any alarm for the future. That the new branch of mining industry has so largely increased the gold production, and thus increased the purchasing power of the consumer, to the great benefit of the producer, can scarcely be regarded with indifference either in New Zealand or Australia.—Melbourne Mining Standard.

Dredging and Mining in Boise Basin, Idaho.

TO THE EDITOR:—Within the past year there has been a marked revival in mining operations in Boise Basin. Idaho City, Centerville, Pioneerville, Placerville and Quartzburg are the principal points in the district, each being the center of activity in its part of the basin. The revival is seen in the building and operation of gold dredgers, in the usual method of hydraulic work and the opening of various quartz mines. More's creek, Grimes' creek and their numerous tributaries, which drain the basin into the Boise river, are well watered, the surface channels changing frequently from one side to the other of the broad bed of sand and gravel that marks the course of the stream. The actual width of the surface channel is usually from 15 to 30 feet in the basin streams, though the bed of alluvial material varies from half a mile to a mile in width and ranging in depth from 20 to 40 feet from surface to bedrock. This condition, accompanied by an abundant underflow of water, forms a favorable one for operating the gold dredger. In some places this bed of sand and gravel may be classed as new material—that is, it was deposited there by the operations of nature; while in others a considerable depth of it is made up of tailings deposited by the operations of hydraulic giants on the banks and bars which rise in benches on either side of the stream. In the beds of new material the values are quite uniform from the surface downward to within a few feet of the bedrock, where the richest stratum is found. At Placerville, where one of the largest dredgers is at work, the material thus screened and washed passes out through an iron flume 4 feet wide and 125 feet long, in the bottom of which are slats and Hungarian riffles for saving the gold.

Other dredging companies have been organized and all possible grounds have been secured by option and it is not impossible, nor improbable, that Boise Basin will contain twenty-five operating dredgers within three years.

The Basin branch of the Twin Springs Co. is operating two giants, with 200 feet head of water against a bank 100 feet high, near Idaho City. This property was sold last year to this company by K. P. Plowman of Boise. The work is in charge of H. L. Woodburn.

Ashby Turner is developing some hydraulic claims on More's creek, above the Boston & Idaho property, and getting ready for next season's work. He is largely interested in bench grounds along the stream, which are best adapted to the ordinary hydraulic work.

Nine miles below Idaho City a bedrock flume two miles in length is being put in to develop pressure for hydraulicking. The work is in charge of Mr. Taylor.

The mountain rim which surrounds the basin on the east, north and west is attracting interest now. Extending from the Gambrinus district, east of the basin, to Quartzburg, west of it, is theoretically a crescent-shaped mineral zone, and considerable exploration is going on for the purpose of proving the theory. Thus far an encouraging outlook is presented.

The Illinois, in Gambrinus, was recently bonded to

DREDGER "LIPPENCOTT" AT PLACERVILLE, BOISE BASIN, IDAHO.

bedrock is reached at 40 feet depth, and the first 20 or 25 feet comprises tailings and wash from the old hydraulic workings, and, while the values in this debris would not of themselves pay for working, the result is highly satisfactory when handled in connection with the richer strata below.

The Boston & Idaho Gold Dredging Co., comprising Boston people, have grounds taking in about nine miles of More's creek, below Idaho City. They have one dredger, of the Risdon type, in successful operation, and are building another of the dipper type. Their Risdon dredger ran several months last year and began its season's work this year about April 1st. Where it is now working the bedrock is reached at 23 feet, the principal values being found within a few feet of the bedrock. Their new dredger will have two 5-foot grizzles. Supt. Rupert Winters states the operations thus far have been profitable and satisfactory.

At Centerville and Placerville Boston parties are represented by one power company and three dredging companies. The Basic Co. have an eight-mile flume on Grimes' creek, whereby 350 feet pressure of water is developed and a 600 H. P. electric power plant is operated. The Bullion, Boise and Bedrock Dredging companies each has a dredging boat, two of which have been operating some time and the third was launched on the 15th inst. Two are on Grimes' creek and the third at Placerville, on Wolf creek. These dredgers, in a general sense, are of the Bucyrus type, having a working capacity of 2500 yards each per twenty-four hours, and are electrically operated by the Basic power plant. The four companies mentioned are under one management. The dredger "Lippencott," in operation at Placerville, has thirty-eight elevator buckets, each of 5 cubic feet capacity, and a 4x15 feet revolving screen, below which is the centrifugal pump. The

William Williamson and others of Spokane, the amount stated to be $30,000 and the time eighteen months. It is his intention to develop the property.

In the same district the Washington mine, belonging to Woolly & Plowman, recently opened an 8-foot ledge of high-grade, gold-bearing quartz. On this property are two parallel ledges, one of gold and the other silver, 30 feet apart. A shaft sinks 300 feet, on the bottom of which are drifts on the vein. The Washington has a 10-stamp mill.

The Lucky Boy, adjoining the Illinois, is equipped with a 10-stamp mill, which is running. A tunnel cuts the ledge at 300 feet depth, and crosscutting to hanging wall is in progress. The ore is said to have cleaned up $8 per ton. This property belongs to John P. Reno of Pittsburg, who purchased it last year for $22,000.

Farther northward is the Elkhorn and Mountain Queen, both under bond to L. C. Ferree, J. M. Jackson, John Kinkaid of Denver and H. L. Hollister of Boston. The Mountain Queen has a 20-stamp mill and is being further developed by an 800-foot crosscut tunnel, which will cut the ledge at 370 feet from the surface, the same ledge being opened by an upper tunnel, above which the ledge is stoped to the surface and longitudinally for 1000 feet. The ore therefrom is said to have averaged $8 per ton on the plates. In the lower tunnel a blind lead was encountered, 6 feet wide, running $5 per ton.

The Elkhorn has a 5-stamp mill in operation. This is an old mine, with considerable amount of ore in sight. Its location is within two miles of the Washington. Mr. Ferree stated that $100,000 would be expended in development and equipment in Boise Basin.

The Twin Sisters, near Centerville, is being developed under the management of E. F. Blain. A new mill is to be erected. This property belongs to parties owning the Trade Dollar at Silver City.

D. E. Coughanour has sold the Iowa group at Quartzburg to the Le Roi people for $150,000, the deal having just been closed by W. B. Heyburn for the purchasers. It is asserted the new owners will spend $100,000 in improvements. WASCOTT.

Idaho City, Idaho, July 17th, '99.

The Precipitation of Gold From Cyanide Solutions.*

By A. H. HARTLEY.

The tailings and slimes to which these remarks apply were produced from the battery of a private mine called the Ulundi, belonging to Thomas Andrews, situated on Fever creek, fourteen miles from Barberton. The ore for the most part was free milling and highly oxidized, and contained a considerable quantity of copper. The tailings varied in value from 5 dwts. to 8 dwts. of gold per ton. After treatment they assayed from 16 to 36 grains. The residues did not vary according to the richness or poorness of the tailings, but according to the cleanness of same. Sometimes the pulp from the battery carried as much as 60% of slimes, and never less than 45%. The tailings, however, were always leachable, and would have been clean had it not been for the presence of from 10% to 15% heavy clay or earth, which would not float off with the slimes and which was certainly detrimental to proper treatment.

Regarding precipitation, the rate of flow of solution through the boxes averaged from 1 to 1½ tons per cubic foot of zinc in twenty-four hours, or from half an hour to three-quarters of an hour's contact.

The following were the strengths of leachings and assay results (results of gold assays stated per ton of 2000 lbs.):

	Gold	
KCy.	*Head of boxes.*	*Foot of boxes.*
.05%	19 dwts.	Trace.
	39 dwts.	4 grains.
	10 dwts.	Trace.
.1%	10 dwts.	Trace.
.14%	16 grains.	Trace.

I found that to continue the treatment which gave these leachings as much as 4 lbs. of cyanide per ton of tailings would be consumed. By using weaker solutions the extraction of gold from tailings continued equally as good, while the cyanide consumption fell to 2 lbs. per ton. The solution assays were now as follows:

NUMBER 1.

	Gold	
KCy.	*Head of boxes.*	*Foot of boxes.*
.02%	8 dwts.	Trace.
.05%	13 dwts.	Trace.
.04%	1 dwt.	Trace.
.002%	2½ dwts.	Trace.

NUMBER 2.

Strength of leachings, KCy.	*+ KCy at head of box.*	*Gold at foot of box.*
.000%	.02%	Trace.
.006%	.05%	6 grains.
.008%	.05%	Trace.

When commencing slimes treatment the increased quantity of solution necessitated the percentage of cyanide again being reduced, in order to keep the consumption within reasonable bounds, and to ensure good precipitation the zinc shavings were dipped in a solution of lead acetate. The precipitation continued as good as before, the average strength of solutions leaching from the tanks being .009% KCy, with the addition of KCy at head of boxes .02%.

Gold at foot of boxes, traces; and without the addition of cyanide to head of boxes the following were the solution assays:

	Gold	
KCy.	*Head of boxes.*	*Foot of boxes.*
.02%	1 dwt.	Trace.
.007%	20 dwts.	Trace.
.004%	2½ dwts.	Trace.
.006%		Trace.
.009%		Trace.

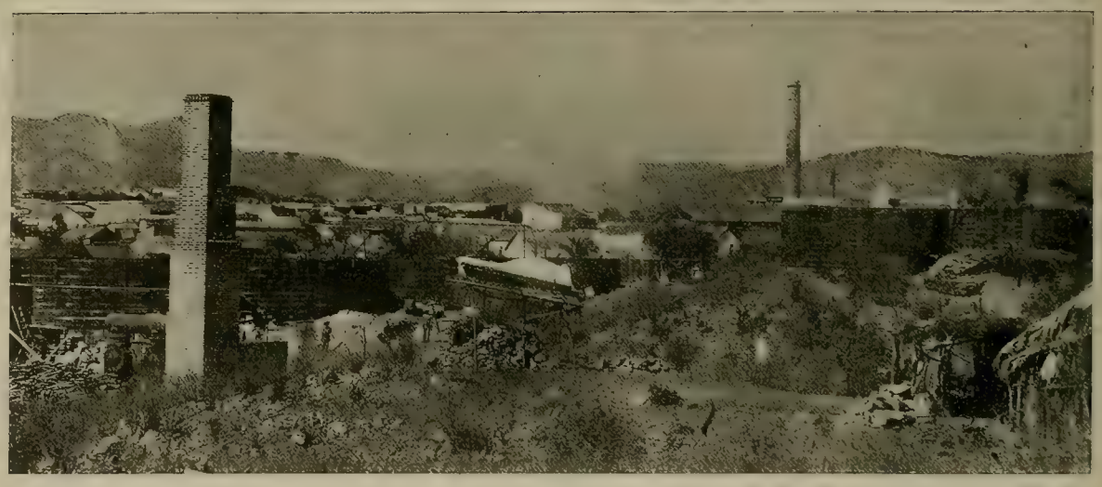
and so on with little or no variation.

The consumption of cyanide now figured at ½ lb. per ton of ore, with as good results as when 4 lbs. per ton were consumed.

It will be seen from the foregoing figures that the precipitation was as good without the addition of cyanide at the head of the boxes as it was with it. When at times the zinc became "dead"—that is, when no action could be observed in the boxes—the addition of a small quantity of cyanide, say $\frac{1}{10}$ lb. per ton of solution, did not bring it into an active state, though the use of caustic soda or a much larger quantity of cyanide did. One objection made to the lead-zinc couple method of precipitation at a former meeting was that aeration necessary for the effective solution of gold in tailings or slimes hindered precipitation in the boxes. This objection would not hold good under the circumstances quoted above, as, if these solutions were not aerated, few are; but this fact never hindered precipitation, as these figures show.

In my opinion these unusually good precipitations from very weak solutions were caused by the presence of copper. If this be the case, copper-bearing ores would seem to present no difficulties whatever

*Journal of the Chem. and Met. Soc. of South Africa.



to the successful treatment of tailings and slimes by the usual zinc method of precipitation.

The resulting cyanide bullion for nine months' work at the Ulundi mine averaged 850 fine, which was obtained by ordinary fluxings, without any special refining agencies. This would show that the copper dissolved from the ore and precipitated on the zinc did not materially affect the fineness of the bullion.

Tanks for Cyanide Plants.

Every season sees the erection of new cyanide plants, which as a rule range from 5 to 200 tons daily capacity. Some time ago the Pacific Tank Co. shipped to La Paz, L. C., what is said to be the largest cyanide plant ever constructed on the Pacific coast.

The plant is almost a duplication of the Simmer & Jack Works of South Africa and consists of eight 40-foot diameter leaching tanks 10 feet high, three 25,000-gallon solution tanks, ten gold solution tanks and the necessary sump tanks and extraction boxes. The plant is working a huge pile of tailings which accumulated at the El Progresso mines. The filling of the leaching tanks is accomplished by means of a ropeway. Water is a scarce article at the mine and all leached tailings have to be shoveled out. To facilitate the discharging of the leaching tanks, each tank is provided with four bottom discharge doors which open directly over car tracks laid in tunnels underneath each tank and the tailings are dumped directly into ore cars. Builders of these tanks find P. & B. paint a valuable adjunct to their success.

CYANIDE PLANT AT PROGRESSO MINES, LA PAZ, LOWER CALIFORNIA.

FIG. 2.—BOTTOM DISCHARGE DOOR OF LEACHING TANK.

Fig. 2 shows the bottom of discharge door designed by the Pacific Tank Co. to meet the requirements of these large tanks. The doors have an 18 x 18 inch opening. They swing under the bottom of the tank and offer no obstruction, are kept tight by square flax packing let into the edge of the door, and are operated entirely from beneath the tank, leaving the entire capacity of tank available for ore.

The difficulty of keeping wooden tanks of this size water tight has been solved. Each stave has a groove cut into the top ½ inch wide by 3 inches deep, forming a complete channel around the upper edge of the tank. This channel is kept constantly full of water, a drip cock renewing whatever amount is evaporated, and to keep this channel from being filled up with dust and dirt a special moulding is used to act as cover to the channel. This process is patented by the Pacific Tank Co., who make a specialty of constructing cyanide plants.

Fig. 3 is a new design of an assayer's cyanide plant with a capacity of 100 pounds. This little plant is crated and shipped complete, including frame, as shown in cut.

FIG. 3.—SMALL EXPERIMENTAL CYANIDE PLANT.

The small tank shown at the highest elevation is to be used as a solution tank, while the tank just below it is intended for a leaching tank, and is fitted complete with false bottom and duck filters. The zinc box shown below the leaching tank has six compartments and is fitted with wire screens ready for use. The lower tank is the sump tank, which is provided with an outlet which facilitates the drawing off of the weakened solution, to be transferred to the solution tank again, where it is made up to full strength. The solution enters the leaching tank through the bottom and is drawn off through the same pipe; but to aid the discharging of the eachedtailings, a union connection will be found just below the leaching tank. This can be easily disconnected, and the leaching tank may then be lifted off and the contents dumped out.

In a similar way the zinc box can be removed by giving the elbow a quarter turn; the box can then be taken out and the contents of each compartment can be removed without difficulty. For parties desiring tests on a larger scale, an experimental plant of three tons capacity has been designed, of which Fig. 4 is a sectional view. This plant consists of one solution tank, three leaching tanks with false bottom and duck filters, one zinc box complete, one sump tank and one vacuum pump.

The leaching tanks included in this plant are 4 feet deep and offer no difficulty for a practical working test. The pump is a rotary force pump and is connected in such way that the same can be utilized as vacuum pump also, when the solution is drawn from the leaching tanks.

The cut also illustrates the general arrangement of these cyanide plants, where the aim is to fill and discharge the solution from the different tanks by gravity. The solution tanks, of which there are generally two, are placed at the highest elevation, the leaching or percolating tanks being on a lower level; the extraction boxes on a level below the leaching tanks and the sump tank at a still lower level. On the same level with the extraction boxes are generally placed the solution pump, the cleanup tank, zinc lathe and

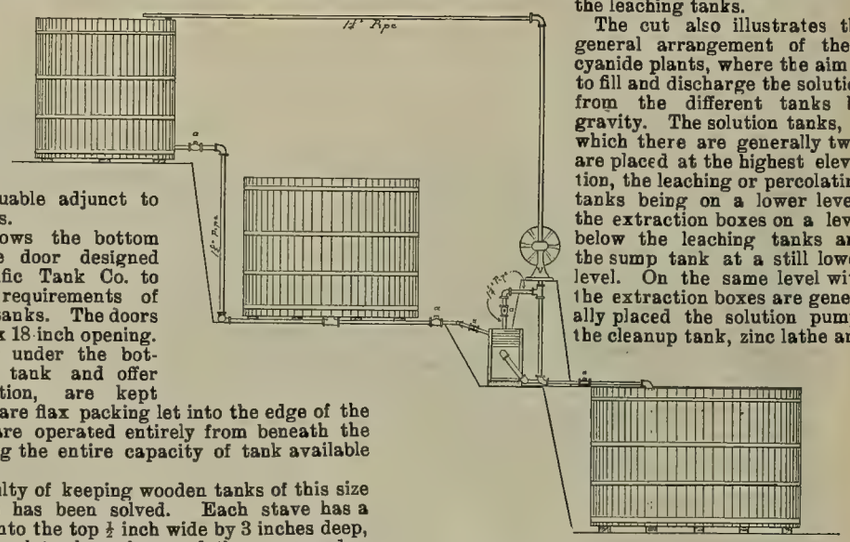


FIG. 4.—LARGE EXPERIMENTAL CYANIDE PLANT.

engine, as this level is practically the lowest. The sump tanks are simply receptacles for catching the weakened solution as it comes from the extraction boxes and are often set below the ground.

A new catalogue of everything pertaining to cyanide plants has just been issued by the Pacific Tank Co., San Francisco and Los Angeles, California, of interest to miners and cyanide workers; a copy will be mailed to any one upon application.

ACCORDING to Chas. Richet, the struggle for existence is a contest for carbon. The activities of life depend upon the force set free by the burning carbon and hydrogen in oxygen, these three elements being the essential foods, the oxygen being abundant for all purposes, while the available carbon is only one three-hundred-thousandth as much. Life is a small quantity of carbon in very complex and instable combination. This carbon is continually uniting with oxygen in slow combustion, passing from one form to another and ending in carbonic acid, which the sun's heat, through the chloroyhyll of plants, decomposes, the carbon reappearing, first in the vegetable, then in the animal, and so on. There is an incessant circulation of carbon, kept in motion by the sun's heat.

THE *Journal of Geology* announces the discovery of a new mineral which, as a fuel, is claimed to be superior to coal. The substance, which is of a lustrous black color, is found on the island of Barbadoes, and is called by the natives "manjak." It is thought that manjak is "petrified petroleum," quantities of petroleum being found on the same island. It contains only 2% of water and 27% of solid organic matter, thus surpassing in utility Trinidad asphalt, in which 30% of water is contained, and which has hitherto been classed as the finest fuel.

IT is said that the diamond drill when put down in the zinc field of southwest Missouri strikes ore almost anywhere. The ore occurs at several horizons to a depth of 1000 feet.

Mining Summary.

ALASKA.

The last report from the Alaska-Treadwell is the first under the addition to the mills. There are two mills in operation, the original one of 240 stamps and the new one of 300 stamps, the latter being run with water power, which can only be done through a portion of the year. Last month the two mills crushed 54,376 tons ore of the value of $92,000. There were 1090 tons sulphurets saved of the value of $40,760, making a total of the month of $132,760. The actual bullion shipment for the month was $141,805, the largest in a long time, if not the largest ever reported. The expenses for the month were $37,500. Considering the amount of ore handled this shows a cost of 69c per ton. The value saved from ore treated averaged $2.44 per ton.

Dr. Hultberg, the Swedish missionary who first found gold at Cape Nome, reports at St. Michael that several promising quartz properties have been found in the Cape Nome district. The discoveries were made July 1st and are in the mountains back of the creeks. There are a great many idle men to be seen about Anvil City, though there is a demand for labor. This idle crowd intended passing a resolution throwing open the district for relocation and jumping the best claims. Such an action would have resulted in bloodshed and there is no telling where the trouble would have ended, because many men would have defended their claims with their lives. Nome is no place for a person in winter if he is not well supplied with warm clothing and sufficient means to provide himself with comforts. The winters are severe, the thermometer often falling to 60° below zero, the cold being intensified by the sea

ARIZONA.

The Dark Horse M. Co. has been incorporated at Phœnix, with branch offices in several cities. The incorporators are J. W. Crooks, W. F. Harsey and G. Caulfield of Boston, Mass., and G. H. Savage of Butte, Mont. The capital stock is $1,000,000.

At Fool's Gulch the old Cornish rolls in the mill have been removed and ten stamps substituted, which are now crushing iron sulphuret ore, which is being concentrated. Sufficient ore is in the bins and on the dumps to keep the mill in operation for five months. One shaft is down 1000 feet, with drifts at every 100 feet, some of which are 500 feet in length. Another shaft is down 500 feet. W. A. Clark is Supt.

Prescott *Journal-Miner*: The report comes from White Picacho district, southeast of Prescott, that a rich strike was recently made in the Winter's group of claims. In the shaft at 70 feet the ledge narrowed from 4 feet to 3 feet, but the ore increased greatly in richness and the vein widened to 3½ feet. In sinking the 70-foot shaft the hanging wall was lost. It is estimated that two-thirds of the ore will carry from $60 to $100 in free-milling gold. The balance is base, carrying copper and gold.

Tucson *Star*: At the Helvetia a diamond drill has been used to ascertain the value of the various claims in the group. The drill has shown rich ore in large veins. Several shafts have been sunk and three tunnels have been driven into the hill. One shaft is down 250 feet; others are down 200 feet. One of the tunnels has been run 350 feet and the contract has been let to drive it another 100 feet. The tunnel is in 125 feet and a winze sunk 55 feet and a drift 50 feet. The air compressor will be run by a double expansion engine. The hoists are run by gasoline engines. The smelter will be ready for ore within sixty days. On the Advance, in addition to copper, paying gold ore is found.

CALIFORNIA.

Butte.

The discovery of petroleum on the farm of G. Wickham, two miles west of Gridley, is reported. A shallow well, used for watering stock, yields quantities of petroleum daily.

The Spring Valley mine of Cherokee has been sold to an Eastern syndicate. The new owners have prospected the mine and have ninety days in which to make out the papers, get the deeds in shape, and pay down the coin. It is said Supt. Hellman of the Spring Valley Co. and W. P. Lynch made the deal. It will be opened as a drift mine. It was formerly worked as a hydraulic mine and from it there was taken $2,000,000.

Oroville *Register*: A 10-stamp mill will be erected on the Golden Trout mine on the South Fork of Feather river, to be run by water power. It is the intention of the company to build a ditch and bring in water to run an electric plant, when electric power will be used in both mine and mill. J. R. Watson, Jr., is Supt.——At the Little Hope mine M. Lambert is Supt. Twenty-three men are employed in the mine. There is a 10-stamp mill on the mine run by water power.

Chico *Record*: It is reported that T. Couch, the capitalist, who has interests along Feather river, below Oroville, has contracted with the Risdon Iron Works of San Francisco, Cal., for three large dredgers for November delivery. The Butte County Electric Power Co., which is putting in a plant above Centerville, has contracted to furnish Mr. Couch 300 H. P. for use in running the dredgers. This will make nine dredgers on the river, as there are five operating, and an additional one is being built.

Calaveras.

The California Exploration Company has bonded the Union mine, south of San Andreas, for $150,000. The property has been extensively equipped and developed. There are several shafts, mills, etc., all of which need repairing.

Calaveras *Prospect*: It is reported that fine ore was struck this week in the 400 level of the Demarest mine, six miles south of San Andreas. The ore shows free gold and high-grade sulphurets. The mill is running full time.

Mokelumne Hill *Chronicle*: Some time ago in sinking a sump below what was regarded as bedrock in a mine near Camanche sand and gravel were found, the so-called bedrock being lava. With a drilling apparatus Mr. McSorley sank four holes, the deepest 310 feet, and found that under the lava there was an ancient river bed, yielding coarse gold. A shaft is being sunk and is now down 65 feet. The gold-bearing gravel is 23 feet thick. It is 160 feet to the true bedrock, which consists of sandstone. [If the formation underlying the gravel channel found by the drill is really sandstone, as above stated, it is not improbable that the true bedrock has not yet been reached, as the bedrock in the vicinity of Comanche is all diabase or rocks of a similar type.—ED. M. & S. P.]

Del Norte.

Del Norte *Record*: Another shipment of ore has been mined and is in readiness for transportation to the Selby works near San Francisco from the Union copper mine. This shipment will consist of fifteen tons. The returns recently received by the Union company from a ten tons consignment has demonstrated that those of moderate means may profit from copper mining in Del Norte county. Yates and Murray, shareholders in the Union, have gone out to the mine to direct its working. J. W. McGowan, also an owner, states that the shaft at the north end of the claim is reopened, and good results are expected from it. From that shaft ore was formerly profitably shipped. The ore from that part of the lead, besides containing a good percentage of copper, yielded an average of $18 per ton in gold. J. W. McGowan and W. Crawford have a copper discovery of recent location on Myrtle creek hill from which they took out in one day 25 sacks of high-grade ore. This mine is on the same lead with that being worked by the Bailey Brothers——W. Magruder recently discovered a copper mine on the Klamath river, a short distance below Orleans Bar. He reports large ledges of the rock impregnated with copper, some of which is metallic.

El Dorado.

(Special Correspondence).—The Granite Hill G. M. Co. is the name of the Colorado company operating the Cambrian mine near Coloma, where they have just finished a 10-stamp mill, which this week began work. Leonard Thomas is Supt.

Coloma, Cal., July 30th, '99.

Near Kelsey Hayward & Lane are putting in a steam hoist and pump on the Santa Clara mine, which they recently bonded.

Mountain Democrat: The mines about Kelsey are becoming paying properties. That owned by Ryan & Job on the Brigham place, formerly known as the Carr mine, has paid from the start, the rock assaying $20 in gold and $8 in silver. The work is hindered by water.

El Dorado *Republican*: A pocket hunter who has been prospecting on China hill below Shingle Springs for two or three years, last week made a rich find and has been taking out gold at the rate of $200 a day. Up to last Sunday he had taken out $800 and expected more.

Placerville *Nugget*: The German mine, four miles south of El Dorado, closed down recently, caused by inability to secure water for power. Fourteen men were employed. Nothing will be done until power can be secured.——At the Griffith Con. a new station is being cut at the 750 level. The work of sinking will continue to 1050 feet. The next station will be at the 950. Crosscutting on the 300-foot level has opened a new ledge of milling ore, 800 feet north and 300 feet east of the shaft.——At the Crown Point they are crosscutting on the 500 level.——The custom mill is crushing 100 tons of ore from the Gebienhein quartz mine.——Next week a run will be made on ore from the Elliot mine, near the Ribbon Rock.——Larkin Bros., owners of the Oro Flamme mine, south of Placerville, are making arrangements for the development of the property. A test run of fifty tons made at the custom mill a short time ago returned $9 per ton. The owners contemplate the erection of a 5-stamp water-power mill.——Work is to be resumed at the Toll House gravel mine, near Smith's Flat. The 10-stamp mill is being put in order. W. P. Stanley has associated with him R. N. Bulla, C. E. Lovett, J. H. Clark and G. H. Stanley of Los Angeles, Cal.

Fresno.

The Central Oil & Mineral Co. has been incorporated at Fresno, $500,000 authorized and $251,000 subscribed capital, directors J. A. and G. W. Giffin, G. W. Smith of Fresno, B. J. Rhodes, H. A. McCall of San Francisco.

W. H. Holabird of Los Angeles, Cal., has taken options upon a large territory in the Coalinga oil fields. He has had an expert in the field for some time.

Copper Mountain Mining and Development Company has been organized to do general mining. Directors, J. B. Hancock, W. D. Foote, W. P. Manley, M. V. Ashbrook, J. H. Sayre, J. G. Anderson, C. H. Williams, J. B. Henderson, J. E. Hughes, Fresno; capital, $1,000,000.

Kern.

(Special Correspondence).—Messrs. Hunt, Rayder & Pollard, recently from the Argus range country, report their camp in a flourishing condition. Assays made on their average ore goes $40 per ton, and is practically free-milling. Their best ore, which is a 9-inch streak, shows a value considerably more. The property is in Spring canyon, forty-five miles from Randsburg; plenty water and a good wagon road to the mines.

Kernville, Aug. 1st, '99.

The Bakersfield Fuel & Oil Co. of Selma has been organized to mine for, buy and sell oil. Directors—A. L. McPherson, Oakland; G. A. Damron, W. H. Shafer, Wm. Spencer, W. J. Berry, F. L. Keller, Selma; C. Lee, Bakersfield. Capital, $16,000.

Bakersfield *Californian*: The El Dorado Oil Co. has leased lands to two different operators, each of whom agrees to bore 36,000 feet the first year. At the end of that time the operators are at liberty to quit or do as much during each of the following two years.

Los Angeles *Times*: The Big Butte had a milling of forty tons of ore recently, which netted $2380. Another body of ore, 4 feet wide, has been found.——At the O.K. mine, one of the Black Hawk group, the shaft is down 157 feet. At a depth of 65 feet a drift was run 90 feet east, tapping a vein of milling ore 2 feet in width.——At the Black Hawk they are down 111 feet. A report from that mine states that from the bottom of the shaft is a drift to the west 125 feet, in which, at 100 feet, is a crosscut 50 feet each way.

Lassen.

Bieber *Gazette*: Gassaway Bros. are hauling forty tons of ore daily for the Golden Eagle mine at Hayden Hill ——J. Bowden, the discoverer of the Idaho mine, has sold his interest in the same to T. A. James.——The owners of the North Star mine have struck more pay dirt.——W. O. Kibble, the cyanide operator and chemist of the Golden Eagle M. Co., is experimenting on Golden Eagle ore with the bromo-cyanogen process. The 220 level of the Golden Eagle mine is developing well. The pay shoot is over 300 feet in length. Up to within a year ago this level was supposed to be exhausted.

Los Angeles.

The Butte Lode M. Co has been organized; directors—A. Jacoby, C. B Dickson, C. W. Howland, H. R. Smith, A. H. Thomas, J. V. Underhill, E. T. Pettigrew, Los Angeles; capital, $300,000.

The Brea Canyon Oil Co. of Los Angeles has been organized with a capital of $200,000; directors, W. G. Nevin, C. N. Sterry, E. L. Doheny, A. P. Maginnis, D. Murphy.

Mariposa.

Miners have gone to the Ferguson mine, on Bull creek, near Hite's Cove. They will clean out the old works.

The village of Coulterville, recently destroyed by fire, is being rapidly rebuilt.

Nevada.

A 10-stamp mill is being hauled to the St. Patrick mine, near Washington. The mill was formerly at the Taylor mine in El Dorado county.

The Crown Point mine, near the Idaho mine, Grass Valley, has been bought by W. B. Bourn, who recently purchased the Osborn Hill mine. A French company last worked the Crown Point. The Crown Point mine is reported to have produced $130,000, of which $80,000 was found in one bunch of ore, with much coarse gold. There is a shaft 400 feet deep on the incline, with drifts east and west. The vein averages 4 feet in width. The ore is quartz, carrying gold, galena and pyrites. Portions of the quartz are mixed with serpentine. An average value of ore, worked by Mr. Gauthier, has been reported at $17 per ton in free gold, with 3% sulphurets, averaging $60 per ton. The length of the pay shoot developed is 300 feet. G. W. Starr will be Gen. Mgr. of the Crown Point, as well as Mr. Bourn's other properties.

Placer.

Auburn *Leader*: At Gold Run the hydraulic mine has closed down, making their last cleanup for the season, as the water has given out.——At Dutch Flat the Nichols mine, the Polar Star, is closed.——At the Blue Lead gravel mine, near Dutch Flat, twenty-five men are employed in the tunnel and erecting a 10-stamp mill. This property was formerly owned by S. Jordan, but was sold to Sacramento parties. Mr. Jordan is superintending the mine. When the mill is running forty men will be employed.——At Bear Valley twenty-five men are putting in a couple of dams across the lower end of the valley for the South Yuba Water Co.——P. P. Ferron, chief engineer of the Jupiter mine, above Iowa Hill, says the Jupiter Co. struck gravel at 353 feet but have not yet reached the main channel, yet the gravel is rich. They are going to crosscut the channel. The bench gravel in which they are working now is 2 feet deep.——Thirty men are employed at the Van Avery quartz mine, and new machinery is being put in, among which is a new 10-stamp mill. A company from Des Moines, Iowa, are operating the mine.——The Bear River Hydraulic M. Co., operating on Bear river, three and a half miles from Colfax, expect to reach bedrock this week. Twelve men are employed. They are operating by use of the hydraulic elevator and work in two shifts.

Colfax *Sentinel*: The Gold Channel Gravel M. Co. are putting in a new steam engine to run the pump and hoist. F. P. Armstrong is Supt. and six men are employed. A shaft will be sunk to bedrock. The mine is a mile from Emigrant Gap.——The J. G. Peters M. Co. are developing their gravel mine at Green Valley. The company have one tunnel in 800 feet. Tunnel No. 2 has been started and is in 50 feet.

Plumas.

The La Porte Con. G. M. Co. of San Francisco has been organized to operate in this county; directors—W. A. Magee, H. J. Knowles, H. W. Bradley, C. D. Olney, M. L. Requa, Oakland; capital, $200,000.

Quincy *Bulletin*: At Granite Basin it is reported that Mr. Trowbridge has bought the Robinson mine. He is preparing to do development work.—G. and W. W. Hall have leased and are working the Altoona quartz mine, owned by T. F. Emmons of Greenville. The property is on the hill above the Green Mountain mine. A 6-foot vein of ore that will mill $7 per ton is being extracted and hauled to the Kettle mill.

Riverside.

Los Angeles *Herald*: A San Jacinto prospector claims to have discovered a mica mine in the vicinity of that town. A Los Angeles expert has visited the find and pronounced it one of value. Many claims have been staked out.

San Diego.

(Special Correspondence).—The recent fiasco of the placers in Lower California calls to mind the former rush to the Alamo district, seventy miles southeast of Ensenada. Major Russell of Los Angeles, who has just returned from there, related, with a reminiscent smile, that at that time all the waiters at the Hotel del Coronado, San Diego, left in a body for the gold diggings, and there was not a barber left in the town. Of the hundreds who went there but few remained, and to-day Mexicans and Chinese are working over the same ground wherever water can be obtained. But the output the camp has later developed is from the quartz mines, and during the eleven years which have elapsed since that first rush, not less than $1,500,000 has been taken out of the quartz properties. The Montezuma mine is now down 270 feet, and the pumping plant is raising 6000 gallons of water per hour. This is the only water available for the placer workings, and is carefully husbanded by the Mexicans and Chinese engaged in placer work. Major Russell has no hesitancy in saying that the mining laws of Mexico afford better protection to the mines than those of the United States, and that in his ten years' experience there his treatment at the hands of the Mexican officials had been all that could be desired. The camp depends for all supplies on San Diego.

San Diego, July 31st, '99.

(Special Correspondence).—The Grapevine district is about 8 miles north of Banner. The Rice district is about 6 miles northwest of Grapevine. The Dewey mine in Grapevine, over which the excitement is created, is reported to be a large ledge or deposit, from 10 to 100 feet wide, with an extensive outcrop. They have bonded it to Colorado parties, who have put down a prospect shaft 100 feet on the ledge, and it is said to look well. The ore is base, very little free gold on surface and none below 20 feet. Its assays average, so an assayer tells me, about $17 a ton. If the parties who have the bond take it, it may make a good camp. Most of the country around Grapevine is located. In Banner things are progressing. L. N. Bailey is driving a crosscut tunnel from the base of the hill through the Kentuck S. ground, using power drills, and is now in 700 feet, with 250 feet to go before the first ledge is cut. The other mines on the slate belt, between Julian and Banner, are waiting to see how the Kentuck S. comes out. If successful they will all be actively worked next winter. The Elevada mine, formerly Holland's, is being worked by Colorado people, who are driving a crosscut tunnel 600 feet to cut the vein under the Holland shaft. They are more than half way in. The Ranchita mine was sold by C. J. Couts to Gail Borden, who worked it for a few months, put in five more stamps and made other improvements, then suspended work, only keeping the water out. The Ready Relief continues work as usual. At Julian the High Peak mine is being worked, using a 12-H. P. gasoline hoist. The Owens mine is being pumped out by Riverside parties with a view of buying. The Helvetia has been idle all summer, but report says it will start up again soon. In both Julian and Banner there is considerable work going on by single individuals and some very good ore is milled.

Banner, Cal., July 28, '99.

Negotiations that have been pending since the conclusion of the lawsuits that engulfed the Golden Cross mines were concluded last Monday at a conference between J. Chandler, I. Trumbo, J. Waller and G. J. Trumbo. The company has decided to add a cyanide plant of 1000 tons daily capacity to treat the tailings that have accumulated. The 140 stamps will be concentrated under one roof and space provided to add 60 or 100 stamps as soon as known ore bodies are opened.

Shasta.

Los Angeles interviews with Geo. Mitchell deny the recent report that W. A. Clark had bought of J. H. Rathbun the copper deposits eleven miles from Redding.

The sale of the Bully Hill mine has caused some excitement, and now there is a rush to Copper City. Nearly the entire townsite has been fenced with barbed wire by squatters, and the country is plastered with location notices. The De Lamar Co. is making arrangements for extensive development. It will erect smelters and build a branch road to connect with the Southern Pacific. Stores, saloons, hotels and all sorts of business houses are being started at Copper City, which was once before a flourishing village about '78-'79.

The cyanide plant at the National mine, constructed by S. P. Poland & Co., is completed. The tailings pile is connected by car track with the plant. The National has 7000 tons of tailings from the stamp mill, and this Mr. Poland will undertake to treat by the cyanide process.

Redding *Free Press*: The ore team road from the Sam Houston mine in Old Diggings to the Sacramento river has been finished. The ore will be carried across the river to the Keswick smelters by means of a bucket tramway. J. Morton, superintendent for San Francisco parties who have a lease on the mine, is sinking the shaft with the purpose of going down 500 feet. The ore averages $14 a ton.——A sale of a three-quarter interest in the Oro Fino mine was made Thursday by J. C. Frick to C. H. Behrens. The Oro Fino is a developed property which adjoins the Mount Shasta on the west. G. A. Schroter of Shasta owns a quarter interest. Messrs. Behrens and Schroter will work the property.

Shasta *Courier*: J. H. Holland, who owns the Dolly Varden ledge, has 4 feet of quartz in the shaft. An assay of the ore showed $54 60 to the ton. The ledge is on Gambler's gulch, on Middle creek.

Siskiyou.

Yreka *Journal*: In the Cherry Creek and Deadwood mining districts mining is dull, in consequence of the scarcity of water.——The new company working at the Nehrbass place

on Greenhorn, adjoining the Blue Gravel mine, has built framework for the hoisting and pumping machinery and run the pumps day and night. The bedrock is several feet deeper than at the Blue Gravel mine; the shaft is down 115 feet, with bedrock 15 feet lower——The Sheba mine at Patterson Creek is turning out well. The ten-stamp mill is in operation day and night.

Tuolumne.

The sinking at the Gerrymander at Sonora continues. A large vein, pitching west, has been encountered 180 feet from the surface—the present depth of the shaft.

The Deadhorse mine at Carters is reported looking well. On the 1600 level they are taking out high-grade ore. Supt. Corkill has built a cyanide plant at this property for the treatment of tailings and sulphides. The latter were formerly shipped to Angels in Calaveras county.

The Genoa M. & M. Co. of Sonora, capital stock $1,500,000, has been organized; directors, G. B. Gianelli, G. B. Ventre, F. Cavalero, W. L. Beal, C. F. Brusie.

Sonora *Democratic Banner*: Development work has been resumed on the Yosemite Gold Mines at Second Gorotte. A shaft is being sunk on the Dewey and rock milling from $50 to $60 per ton is being taken out. The Sampson is being tunneled to tap the ledge 200 feet deep. Milling and hoisting machinery will be put on the property. The mines are under the management of H. Argall.

Sonora *Union-Democrat*: At the Santa Ysabel mine, Quartz mountain, the 700 level in No. 1 shaft was reached this week, and sinking will be continued. Development is progressing at many points and ore is being extracted from drifts on the 400 and 500 levels. Sixty men are employed. A 200 H. P. electric hoist was bought recently.——The Longfellow mine at Big Oak Flat is yielding rich ore.——The main shaft in the Mack at Big Oak Flat is down 335 feet.——Work on the Big Oak mine at Big Oak Flat has been resumed. A new 30 H. P. engine has been placed in position.

Trinity.

W. Maguire is reported to have found rich ore on Union creek.

G. Carr is still taking out pay from the Yellow Rose.

Tulare.

Porterville *Enterprise*: Two shifts are working in the Homestake mine, near White river, owned by Grover & Peck.

COLORADO.

On Monday, the 31st ult., the State Board of Arbitration filed its report on the investigation of the smelter strike. The decision it reached is a compromise between the demands of the smeltermen and offers of the American Smelting & Refining Co. The board has fixed a wage schedule on the basis of an eight-hour day for the inside men and a ten-hour day for yard men. The wages recommended average 10% higher than those offered by the smelter managers. The board stipulates that in case of an agreement to work longer than eight hours, the men shall receive pay at the same ratio of wages as recommended for eight hours. The question of union or non-union labor is ignored, and this point is the only obstacle in the way of reopening the smelters, as the men pledged themselves to abide by the decision of the board, and it is believed that the managers will accept the solution of the problem offered by the arbitrators.

The operating committee of the American Smelting & Refining Co., at a meeting held Aug. 1st, decided not to reopen the smelters in Denver and Pueblo at the scale recommended by the State Board of Arbitration. The committee published a card in which it says: "The decision of the Board of Arbitration cannot be accepted by the American Smelting & Refining Co., because it is unreasonable and unjust. The Board has undertaken to arbitrarily interfere with industrial conditions in Colorado, in a way which cannot fail if persisted in to bring about great hardships to the industries already established and to surely prevent new industries from establishing themselves here." It is reported that the company will reopen the Omaha-Grant smelter next week if enough men can be found who will accept the wages offered. The smeltermen's union will post a guard around this smelter and endeavor to dissuade men from working there, as was successfully done at the Globe smelter last week.

BOULDER COUNTY.

S. P. Roy discovered copper ore near the intersection or Boulder, Gilpin and Jefferson counties, now Roy Center, eighteen years ago. Two years ago a man named Wagner opened a copper claim with a 60-foot shaft, a tunnel 50 feet long and an upraise from the tunnel. He has a vein 3 to 6 feet wide, which gives returns of $5 to $12 per ton in gold, 11% copper and from $2 to $6 in silver. This is at Benson, four miles from Roy Center, where Little Beaver creek empties into Coal creek. Mr. Roy has located and opened several claims, from one of which he has had several mill tests. One lot of 3000 pounds milled $5 per ton in gold. One lot of 1800 pounds smelting ore returned $33.20; another of 2300 pounds, $86.40; and one sack of selected ore ran $500 per ton; all these values were gold. The country rock is limestone. Many specimens show masses of copper glance, while others are full of free gold.

CHAFFEE COUNTY.

The Buena Vista smelter commenced operations July 27th, after a close down of forty days, owing to the breaking of the power dam. This will cause the Black Prince and other properties at Leadville to resume shipments. The Little George shaft has material suitable for this smelter, besides a breast of 700-ounce silver ore.

Idaho Springs *Gazette*: The Texas shaft is 125 feet deep and the ore is said to be improving. A plant of machinery has been ordered and will be put in place in a few days, when sinking and drifting will be resumed.——Mr. Ireland of Idaho Springs has his Silk Finish shaft down nearly 100 feet and a mill is being talked of.——The Old Stonewall is to resume work in a few days under the management of J. J. Smith.——Two shifts are driving the Sierra Nevada crosscut tunnel. This property is making water so fast that it is impossible to sink without machinery.

CLEAR CREEK COUNTY.

Denver *Republican*: C. Parrott has made a rich find on Chicago creek, where he opened into quartz which runs 300 ounces to the ton, with a percentage of copper. The chunks of quartz are larger than a man's head and filled with free gold.——The Roadside mine is putting in machinery, with the intention of sinking. The vein shows high-grade mineral wherever prospected along the surface and also in the shaft.——In the lower level of the Shafter mine, Mgr. Shepherd reports a wide body of smelting ore.——Drifting in the Quaker mine 250 feet north of the shaft, Mgr. Ward reports ore bodies on both walls. It will be stoped and hauled to the Wilkie mill for treatment.——Lessees working in the Extension mine have opened rich ore on the west side of the shaft. The streak shows the entire width and runs $200 to $300 per ton.

DOLORES COUNTY.

The mines of Rico district will continue on the eight-hour basis.

The Silver Swan tunnel at Rico is to be extended 400 feet to tap the ore body found in the Cowdry claim of the Silver Swan group.

EAGLE COUNTY.

A pump has been placed in the Johnson mine, on New York mountain, and the mine will be drained and opened by the time the new cyanide mill is completed.

In Red Mountain district J. Dewar has reopened an old claim on which he did work years ago. He recently visited Bromley and thought the ore there resembled that in his claim; this led him to reopen the caved tuntel. The vein was opened up and found to be 6 feet wide, carrying a pay streak 1 foot wide that assayed $75 in gold, silver and copper—about 6% to 10% in the latter value.

GILPIN COUNTY.

Central City *Register-Call*: Hedden & Son are operating on the twenty-acre tract owned by Kountze & Ashley of Denver, and have taken a contract to sink 150 feet. They have a 4-inch pay streak carrying assay values of $160 per ton.——Stephenson & Babcock are working in Beaver creek, and with sluice boxes are cleaning up, it is reported, $7 to $10 per day to the man.——It is reported that the Fort Logan property, south of Boulder creek and near the Barr ranch, has been sold. It was being worked by local parties under a lease and bond in the sum of $15,000. J. H. Kemp of Eldora is said to have made the sale.——New York parties have become interested in a tunnel site in lower Moon gulch, near the Taylor property. Mr. Austin is in charge, and it is reported that when the tunnel is fairly under way an air compressor will be put in.——The Golden Gulch M. Co. has purchased fourteen claims running from Travis gulch south toward the Gold Dirt and Perigo properties, the deal having been made by R. Duncan of Boulder. A crosscut tunnel has been started from Travis gulch and is now in 50 feet, and the company will put in an air compressor. They also intend to sink three shafts to the tunnel level. In this group are the Hancock and Garfield, patented claims. A 22 H. P. steam hoist is to be placed at the deep shaft. W. W. Olds is Gen. Mgr. and Supt. The company intends to erect a 20 rapid drop stamp mill with a daily dapacity of seventy-five tons.——Fifty men are at work at the Perigo, operated by the Tonawanda M. & Leasing Co. All work is being done under the leasing system.——A. G. Elliott is building a revolving mill of new design, below the Perigo mill, with the intention of treating the waste from that mill.

GUNNISON COUNTY.

A twenty-ton concentrator will soon be in operation on the Eureka mine at Crested Butte, which has 5000 tons of an old dump which averages $10 per ton in gold, silver, lead and copper.

The Keystone mill at Crested Butte, when finished, will handle one ton per hour and put five tons of ore into one ton of concentrates.

The smelter at Marble is receiving ore and will soon be blown in.

Gunnison *News*: The Woodard G. M. & M. Co. is working its property at Spencer. Three carloads of machinery and supplies have been received, and the machinery is being put up and buildings are being erected. The shaft of the Tomboy lode, one of the group owned by the company, is being sunk.

Denver *Republican*: The Granite Mountain G. M. Co., in the Tomichi district, will have a pyritic smelter of the capacity of 100 tons per day in operation by the first of September. The grading and foundation work for the smelter has been completed. The mine is developed by a tunnel which has cut a number of veins, most of which carry ore. The success of the initial plant and the further development of mine will be followed by the erection of a duplicate plant, the power having been purchased with that end in view.

HINSDALE COUNTY.

Denver *Republican*: Two feet of rich ore shows in the Copper Hill mine, on Copper mountain. Under the old management ore running 1200 ounces silver and 30% copper was shipped, the lowest grade running 100 ounces silver and 20% copper.——The Fleece mill will soon be completed, employing 100 more men in mill and mine.——The Reynolds tunnel will cut the Vermont and Ocean Wave veins in depth and make a heavy production.——The Lellie tunnel is nearing the vein, and, when completed, will employ seventy-five more men.

LAKE COUNTY.

Leadville *Miner*: The recent discoveries on Breece and Little Ellen hills have caused a lively interest in undeveloped land on these hills and Evans gulch. The Guggenheim exploration syndicate is considering the purchase of ground, believed to be the ninety acres of patented ground embraced in the Diamond group, owned by J. H. Goodman of Leadville.——The owners of the Great Hopes, Nellie, Nora, Kathleen and other patented ground in Evans gulch believed to be on the ore chute are entertaining propositions from responsible parties for long lease, and bond offers have been made by responsible parties to the English owners of the New Elkhorn. All the drifts now being run at the Fortune mine are in ore. This, together with the way the Dollie B., Resurrection and New Monarch mines are opening, will continue to stimulate development in this vicinity.——The Sierra Nevada, Wells and Moyer, on the placer ground of the Iron-Silver Co., are not shipping iron or lead sulphides. The management is breaking sixty-five tons daily of zinc sulphides which go to Antwerp, Belgium, and conducting development work with the eight-hour system. In stoping the heretofore valueless zinc ore, the development of the iron and lead sulphide bodies is kept up. The company mill is being fitted up for work.

MINERAL COUNTY.

Creede *Candle*: G. Davis, Pres. United Mines Co., has started up their property. H. C. Rowley has the management of the mines, and the first work will be to retimber the shaft and pump out the water, when the Big Kanawah tunnel will be commenced to make connections with the Nelson tunnel.——Last week the Punxsutawney was bonded and leased to B. F. Thomas for $8000 by Segar & Terrel, the locators.——The Nelson tunnel has passed the Last Chance shaft and the Last Chance people are talking of making a connection between the two.——The Revenue Tunnel Co.'s new plant is erected and Mgr. Taff will start the compressors and put on a large force the first of August.

OURAY COUNTY.

The American mine at Ouray is shipping ore averaging fifteen ounces gold per ton and will produce $75,000 this year. The owners of the mine are lessees of the O. & N. tunnel and have taken $24,000 in gold from it this year.

The Humboldt mine at Ouray has been reopened by F. Farrish. Humboldt ore averages 200 ounces silver and $10 per ton in gold. It was one of the largest shippers in western Colorado eight years ago.

Ouray *Herald*: The miners of Ouray county will demand a continuance of the eight-hour day, which has been in force for some time.

SUMMIT COUNTY.

Breckenridge *Journal*: The Gambrinus lode, on the Little Georgia gulch side of Farncomb hill, shows gold, silver and lead. A test of the ore made at the Kilton sampler was satisfactory.——The Gold Dust leasers have made a good shipment.

TELLER COUNTY.

On the school section near Grassy, and on properties in the vicinity, shipments will soon recommence. The Colorado Midland Co., operating a lease on the school section, struck the first ore in this section last year. For several months it maintained a steady production and might be doing so now but for the fact that the shaft could not be deepened without being straightened. Instead of doing this the company put down a new working shaft farther up the hill. The old shaft has been abandoned and the machinery removed to the new location. The shaft is to be put down 250 feet before levels are run. The shaft is down 195 feet.

The Little Daisy of the Golden Hub Co., located in this section, is waiting for hoisting machinery. The shaft is down 118 feet.

The Orphan Bell G. M. Co.'s four claims—Orphan 1 and 2 and Ida Bell 1 and 2—comprising twenty acres on Bull hill, Cripple Creek district, have been bought by Colorado Springs capitalists for $210,000 cash.

Recently A. L. Dickerman of Boston, representing the Calumet & Hecla Co., bought five claims on an option secured a year ago for $85,000.

The Orphan Bell properties have shipped $350,000. The Arrow and the Orphan companies, each capitalized for $1,250,000, will be organized to operate the property.

N. Wilson, who recently took charge of the Dante on Bull Hill, outlined the work which has led to the recent discoveries in the property. One of the conditions of Mr. Wilson's engagement with the Dante Co. was the agreement that the property should be re-equipped. A new and larger hoist will be bought, new boilers will be put in place and air compressor and drills installed.

The Johnson shaft is down 450 feet, and it is the purpose to sink for another level, probably at 550 feet. Some crosscutting from the 450-foot level will also be done to cut the ore body found in the Close Shave lease, the new ore body opened up in the Whisper lease and the new one which is thought to be pitching in from the Gold Sovereign.

IDAHO.

What promises to be a gold district has been discovered up the Boise river, thirty-five miles from Boise City. Two ledges were opened last week on Badger creek from which rich assays were taken. Four more parallel ledges have since been found. One of these was struck July 30th. It was uncovered some time ago by a break in the flume of the Twin Springs Placer Co., but it was not observed until prospecting for lead was begun as a result of the finds of last week. This vein is 22 feet wide and shows free gold in considerable quantities.

MONTANA.

T. Holman, assistant electrician at the Rarus mine, was instantly killed July 28th while putting a carbon into an arc light. He held on to the frame of the light as he stepped from a board to the damp earth, thus establishing a ground connection.

Butte *Inter-Mountain*: J. A. Coram, H. A. Root and other capitalists of Boston have secured control of the Gem mines, north of the Speculator, and, it is said, will begin work under the direction of I. N. Merrill, who has had charge of the operation of the Cochiti mine, in New Mexico. The Gem mine was last operated by Frank & Whitmore.——It is reported in Butte that the Speculator mine, owned by J. Creighton of Omaha and the Largey estate, has been sold to the Amalgamated Copper Co., the purchase price being in the neighborhood of $1,000,000. It is said there is three-quarters of a million dollars worth of ore in sight. New machinery is being placed on the ground.

Inter-Mountain: A. Marcille, J. Chattelle and others have leased to J. Hore of Butte, for two years, the Black Rock claim in the Zosel district. The Black Rock has produced some rich ore. It adjoins the Emery on the west.

NEVADA.

A committee which has had the matter in charge has about decided to contract with the Truckee River General Electric Co. for electrical power for the Comstock mines at Virginia City. The proposition is to have the T. R. G. E. Co. furnish 5000 H. P. from a plant at Floriston, Cal., at $5 per H. P. per month, $8 for 1500 H. P. or less. The mining companies in the agreement are to give a $100,000 bonus, to be paid back by the electric company in rebates, the bonus to be secured by a bond. The electric company is to erect two wires; in case of breakage, it is to supply power from the paper mill plant at Floriston. Work is to be begun as soon as the contract outlined above is signed.

Mgr. Ross has sent the following telegram to the office in San Francisco, concerning pumping operations at the C. & C. shaft:

VIRGINIA, Nev., Aug. 3, 1899.

To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco: At 6:30 this morning the water was 16 feet 6 inches below the 1950-foot level station. The water has risen and fallen during the past twenty-four hours, while the elevator was working continuously. G. McM. Ross.

Pioche *Record*: A new strike at Stateline has been made at the Ophir group, samples showing 1458 ounces silver, 2.60% copper and $8 60 per ton in gold. The ore was found below the 150-foot level. The Ophir is now held on an option by R. J. Evans of Pioche.——C. L. Roe has sold his interest in the Vesuvius mine to Addison Bybee for $10,000. Mr. Bybee has also bonded the Challenge mine for $20,000. This mine has a large body of low-grade lead and a good percentage of copper. There are thirty men at work in the old camp. Out of eight claims being worked, all are producing copper ore that runs from 25% to 40%, first-class; second-class from 9% to 17% copper.

Randsburg *Miner*: At Searchlight, near the California line, the Good Hope has a shaft 130 feet deep. G. F. Colton, the owner, is taking out some good ore, mostly free milling. It is hauled by team twenty-five miles to Manvel, the end of the California Eastern R. R., then down to Blake thirty miles before it reaches the main line of Santa Fe, and none but the richest ores will bear the cost of transportation and leave anything for the owners.

NEW MEXICO.

The Arimer Con. Copper Co., with capital of $5,000,000, has been incorporated for the purpose of operating mines in Arizona and New Mexico. The incorporators are C. N. King, F. R. Vanderhoof, F. Golderbarn, J. R. Mulvaney, all of Jersey City, N. J.

The Golden Standard mine and machinery at Golden have been sold to J. R. Phillips of Denver by R. M. Carey and associates for $35,000.

OREGON.

The Twin Springs M. Co. of Idaho, which owns the Deer Lodge mine at the head of Rock creek, sixteen miles west of Baker City, after a shut down since last February on account of deep snow is to resume work. The mine is situated on the North Pole and E. & E. lode, crossing the mountains at the head of Rock creek, and was purchased last year by the Twin Springs Co. from Andy Hansen for $100,000, of which $15,000 was paid.

The Weatherby Bonanza G. M. Co. in Chicken district has declared a dividend of $1562.50 within a month of its incorporation. The funds came from a run of 935 tons of ore in the bins when the company bought the mine in June.

Boise *Statesman*: The Iron Dyke mine, belonging to the Northwest Copper Co., has been shut down, with the employes in possession. For three months there has not been a pay day and the men employed in the mine concluded to take possession of the property until paid. Guards were placed over the property day and night. For an extra precaution the men drilled a hole in rock near the mine and loaded it. This they intend to touch off, if attempt is made by the management to regain possession as a signal to the rest to fall in line.——The work on the Ox Bow tunnel is practically shut down, as the contractors are in arrears in the payment of their men.

UTAH.

The United States Mining Company, which has over $3,000,000 invested in Bingham properties, on the 1st inst. bought 22,000 of the 30,000 shares in the Centennial-Eureka mine in Tintic for $1,540,000. The mine has paid nearly $3,000,000 in dividends, all the proceeds of high-class ore. Second-grade ore has been thrown on the dump, as the company never built a mill.

Salt Lake *Tribune*: Reports from Bingham indicate a strike in the Ophir, owned by W. Robertson, assays from the ore showing 51% lead and gold and silver values from $10 to $15 per ton. It has been prospected for eight years. J. Aylward has charge.——A. F. Holden sold to the United States M. Co. the

McGinnis, a portion of the Cluster, the 1889 and After Thought mining claims at Bingham. The ground adjoins the main properties embraced in the United States Co.'s domain.—The contract for the enlargement of the mill of the Daisy M. Co., West Dip, has been let to J. Dederich. The plans provide for the addition of four leaching tanks, each of a capacity of 150 tons, together with new elevators and conveyors, the entire work entailing an expenditure of $10,000. With the enlargement, the plant will have a daily capacity of 250 tons.—The Boss Tweed M. Co. will straighten the shaft, which will be raised above the tunnel level to the surface. They will also purchase machinery.—Chief Sowawic has entered a protest against the Raven M. Co., to which an exclusive permit to mine elaterite and other hydrocarbons on the Uintah reservation was given by the Indians. The Chief claims that the Indians have derived no benefit from the operations of the company. J. H. McConnell, Gen. Mgr. Raven M. Co., says the complaint that Chief Sowawic lodges against his company is nothing but the ravings of an old man. The few whites who were originally opposed to the concession abandoned their opposition on the assurance that several hundred miners would be provided with employment. The men employed in the mines, it is claimed, do not number a dozen. The trouble that Sowawic has started threatens to grow.

WASHINGTON.

Northport *News*: On Galena mountain, in Flat Creek camp, the Globe Gold Field M. Co. has awarded a contract to J. Downing to extend the present tunnel 50 feet. Seven feet of ore matter now appears in the face of the tunnel. S. H. Whitney is Supt.

FOREIGN.

BRITISH COLUMBIA.

Victoria *Times*: The force on the Old Gold mine, Trout creek, is being increased and the property is improving.—Work was started August 1st on 200 feet of tunnel on the Guinea Gold & Scottish Canadian Co.'s properties.—A shaft sunk on the Klondike group has exposed a lead 4 feet in width which contains 6 inches of galena ore which runs 180 ounces silver, 50% lead and $4 gold.—At Rossland a change has been made in the management of the War Eagle and Centre Star mines.—J. B. Hastings has been appointed consulting engineer and resident director of several mining companies controlled by the Gooderham-Blackstock syndicate in British Columbia. Mr. E. B. Kirby of Denver, Colorado, has been appointed to succeed Mr. Hastings as general manager of the War Eagle and Centre Star mines.—At Nelson it is reported that not a mine has been closed down owing to the eight-hour law. They are paying $3.50 for an eight-hour day and would take on more men if they could get them.

Nelson *Miner*: On the Apex, situated on Big Four Mountain on Hidden creek, seven miles from the railroad, the ledge is in granite and carries manganese, iron and copper pyrites. The ledge runs from 4½ to 7 feet in width. Assays show copper $67.26, silver 60 cents, with traces of gold.

MEXICO.

Two Republics: The first shipment of ore from Guerrero del Oro (Golden Guerrero) arrived in Mexico and consists of seven tons and is followed by three more. In addition to this Professor Niven has 500 pounds of specimens, which have also arrived. These specimens are taken from the different mines in the Otitlan region of Guerrero. In nearly every case the specimens show free gold.

SOUTH AFRICA.

The total output of gold in the Transvaal for June amounted to 467,272½ ounces, an increase as against the previous month of 819¼. The new producers are Ferreira Deep, Roodepoort Central Deep and Lancaster West.

Personal.

H. BRATNOBER is in Australia.

VERNER Z. REED has returned to Denver, Colo., from London.

L. C. TRENT has returned from London to Salt Lake City, Utah.

RAPHAEL PUMPELLY is prospecting a mineral tract near Idaho Springs, Colo.

LOUIS JANIN AND W. S. KEYES have returned to San Francisco from Butte, Mont.

LEONARD THOMAS is Supt. of the Cambrian M. & M. Co., now operating near Coloma, Cal.

H. Z. OSBORNE of Los Angeles, Cal., is examining mining property in Trinity county, Cal.

WALTER KNIGHT is the new Supt. of the Marshal mine, San Andreas, Cal., vice J. F. Clapp.

W. A. CLARK of Montana is inspecting the United Verde copper property at Jerome, Arizona.

R. H. HERRON has returned to Los Angeles, Cal., from an examination of oil-bearing territory in Colusa county, Cal.

H. A. KELLAR, who built the furnaces at Keswick, Cal., has returned from Salt Lake City, Utah, to San Francisco.

N. S. WIGHT has returned to San Francisco after an extended series of successful mining transactions in Mexico and Arizona.

ROY D. HUNTER, representing the Sullivan Machinery Co. of Chicago, has returned to Denver, Colo., from Salt Lake City.

J. H. EARLE, formerly Supt. for the Mammoth, Utah, Co., has accepted a similar position with the Dalton & Lark at Bingham.

V. M. CLEMENT is in Bingham, Utah, having returned from London July 28. From Bingham he goes to the Cœur d'Alenes, Idaho.

CARL VON REISCHACH, E. M., Mgr. of gold mines near Delta, Shasta county, Cal., is in San Francisco on business. He was formerly Mgr. of mines in Mexico and Chile, and more recently with the Golden Gate mine of Grass Valley, Cal.

CAPT. THOS. MEIN is the president of the Mariposa Commercial Co, that will work a portion of the "Fremont Grant" in Mariposa county, Cal.

N. WILSON, formerly Supt. of the Moon-Anchor mine at Cripple Creek, Colo., has taken charge of the Dante mine on Bull hill, Cripple Creek.

JOHN HEINRICH AND C. BRUNER of the Mercur, Utah, mine, have gone to Grant county, Oregon, to inspect the May Queen, in which they are interested.

PAUL JOHNSON has about completed his Madera, Cal., engagement and goes to Greenwood, B. C., to build and operate smelting works for the B. C. Copper Co.

PH. DEIDESHEIMER returned to San Francisco the 1st inst. from a trip to Lone Pine, Inyo county, Cal., near which place he made an examination of mines that had not been entered for twenty years.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 25, 1899.

629,649.—MATCH SAFE—J. Bond, Coulterville, Cal.
629,499.—TREATING HIDES—J. R. and J. S. Brown, Alameda, Cal.
629,515.—VESSEL COVER—B. G. Call, S. F.
629,742.—SELF-DRAINING VESSEL—Helen J. Carden, Bakersfield, Cal.
629,757.—CORRECTING COMPASS ERRORS—J. Christensen, S. F.
629,661.—PEW ROPE AND LOCK—Clark & Watson, S. F.
629,570.—CHAIN PROPELLER—L. Kohn, Oakland, Cal.
629,452.—WHEELED SCRAPER—G. W. Lovejoy, Tehachapi, Cal.
629,581.—CARBURETOR—F. L. Martenetti, Chico, Cal.
629,460.—CANE AND UMBRELLA—J. R. Nagell, Everett, Wash.
629,461.—POWER TRANSMITTER—R. F. Nichols, Altura, Cal.
629,602.—ELEVATOR—R. H. Postlethwaite, S. F.
629,523.—BOX FASTENER AND SEAL—W. C. Rarig, S. F.
629,701.—GAS GENERATOR—J. M. Schofield, Stockton, Cal.
627,474.—HARROW—W. Seckler, Corvallis, Or.
629,725.—WATER GATE—P. K. Shaffer, Redlands, Cal.
629,406.—LAMP HANGER—Thorp & Normart, Fresno, Cal.
31,393.—DESIGN FOR BANDAGE—D. D. McClure, Portland, Or.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOX FASTENERS AND SEALS.—W. C. Rarig, San Francisco, Cal. No. 629,523. Dated July 25, 1899. This invention relates to a device which is especially designed for the fastening and sealing of boxes and similar containers. It consists of two plates, one fixed to the box having an upwardly projecting free end with a beveled lug or lugs formed upon said end, and the other fixed to the cover of the box and movable therewith approximately in the plane of the upper end of the first-named plate, said movable plate being slidable over the companion plate, and having an opening adapted to engage the lugs of the lower plate. A tongue is formed within said opening which acts as a guide for the locking lugs and has a fastener to keep them in place after engagement. In conjunction with this a destructible seal is employed with means for enclosing it between the plates, said plates having openings through which the seal is exposed when they are interlocked. The opening and separation of the fastening destroys the seal in every case.

DEVICE FOR CORRECTING COMPASS ERRORS.—Jorgen Christensen, San Francisco, Cal. No. 629,757. Dated July 25, 1899. This invention relates to an apparatus which is designed for the correction of compass errors, such as deviation which may occur either by reason of masses of iron about the vessel or its cargo or from other source, and the device is also designed to obtain accurate bearings of or from any terrestrial object or celestial body. It consists of a counterbalanced suspended compass card turnable upon the central point and a surrounding ring within which it is suspended, said ring being also suspended in a compass bowl and having an indicator in line with the ship's head. A central disk is pivoted upon the compass plate and is turnable independently thereof. Arms project radially in opposite directions from the disk and have central radial lines. A light deflector is pivoted at right angles with said arms and turnable about its pivots and a vertical bisecting line is marked upon the deflector to coincide with the lines upon the arms. A shadow pin is set vertically upon the arm in front of the deflector and coincident with the bisecting line thereof.

Recently Declared Mining Dividends.

Weatherby Bonanza G. M. Co., Washington; dividend No. 1, ⅛ of 1 cent per share, $1562; Aug. 1.

Boston Get-There Zinc Co., Missouri; July dividend, 1%; payable Aug. 10.

Swansea M. Co., Utah; dividend No. 35, $5000; payable Aug. 10. Total $165,000.

Boston-Providence Zinc Co., monthly dividend, ⅛ of 1% on preferred stock and quarterly dividend of 1½% on common; Aug. 4.

Mammoth, Utah, $40,000; Aug. 1.

Republic, Washington, $35,000; payable Aug. 15.

Franklin Copper Co., Mich., semi-annual dividend, $8; Aug. 1.

Commercial Paragraphs.

THE Union Sampling Works, Denver, Colo., have been sold to H. E. Woods, an assayer of that city.

THE Rand Drill Co. are shipping air compressors, steel for drills and rubber hose to Clarkson & Co., Vladivostock, Siberia.

THE Westinghouse Electric & Manufacturing Co. of Pittsburg, Pa., are to build works at Manchester, England, and employ 5000 men.

A CONTROLLING INTEREST in the Stanley Electric Manufacturing Co. has been bought by the Sprague Electric & Elevator Co. for $150 per share.

THE Stillwell-Bierce & Smith-Valle Co., Dayton, O., have a contract for four turbine wheels for the Virginia Electrical Railway & Development Co. The price is about $20,000.

THE Denver agency of the Jeanesville Iron Works Co. reports sale to the Sun & Moon mine, Idaho Springs, of a duplex station pump; to the Bassick gold mines, Silver Cliff, a large station pump; to the Northern Coal Co. a station pump of 500 gallons capacity and to the Bankers mine, Leadville, Colo., a No. 7 sinker.

A NEW centrifugal concentrator and gold separating machine, manufactured by the Staahlgren Mineral Extracting Co. of San Francisco, has recently been tested on the ruby sand of Latuya bay on the Alaska coast. The experiment was conducted by Karl Staahlgren, the inventor of the machine, and it is claimed gave such satisfactory results that four additional concentrators will be shipped to the same point by the next steamer.

THE entrance examinations for the Massachusetts Institute of Technology have been held this year at the following points: Albany, N. Y.; Boston, Mass.; Buffalo, N. Y.; Chicago, Ill.; Cincinnati, O.; Cleveland, O.; Concord, N. H.; Denver, Colo.; Detroit, Mich.; Exeter, N. H.; Indianapolis, Ind.; Kansas City, Mo.; Louisville, Ky.; Manlius, N. Y.; New York, N. Y.; Philadelphia, Pa.; Pittsburgh, Pa.; Portland, Me.; Poughkeepsie, N. Y.; St. Louis, Mo.; St. Paul, Minn.; Springfield, Mass.; and Washington, D. C. The total registration, 633, is seventy-eight more than last year, and the largest in the history of the Institute. Of these, 261 are preliminary applications for admission in 1900. A continually increasing proportion of applicants divide their examinations between two successive years. Entrance examinations are also held in Boston in September.

A GOOD scheme recently noticed and one which commends itself from its thoroughly practical character is the reading room which Irving & Co., the Los Angeles assayers, maintain as a regular feature of their business. The sign at the door reads "Mining Camp," and once within, the man interested in mining finds at his disposal files of all the latest mining journals, writing material and other conveniences. Along one entire wall is arranged a series of bins which are used free of charge for the display of ores, with the information necessary. The bullion buying feature of this firm's business is one of the surprising things about it, and nothing shows more clearly the advance which southern California has recently made in gold mining. Mr. Irving states that business is at present somewhat quiet, pertinently stating that "any man is a fool to stay out on the desert at this time of the year who does not have to." Their facilities for proper handling of all kinds of ore are unusually complete.

THE Denver Engineering Works Co. report several carloads of machinery already shipped to the two mills they are building for the Mountain Pride G. M. Co. and the Ault-Wiborg Co., in the vicinity of Breckenridge, Colo. Both of these mills are well advanced in construction and when finished will represent the modern type of concentrating mills in the State. The Mountain Pride mill will be operated by steam power and the Ault-Wiborg by electric. The Denver Engineering Works are now erecting at their works two pyritic smelting furnaces, for which they have recently received orders; a large traveling crane has been constructed especially for the purpose of putting these furnaces together before shipment, to insure that everything will go together properly. One of these furnaces will be erected in Leadville and the other near Atlanta, Ga. The total shipment to Georgia will comprise a fair-sized trainload. This company is also building a sampling plant, to be operated in conjunction with the Georgia smelter. Ten carloads of 16x36-inch Denver crushing rolls have just been shipped to Cripple Creek, for the large mill now being built by the Economic Gold Extraction Co. The demand for the Cammett concentrators built by this company has increased to such an extent that they have been obliged to enlarge their facilities for turning out these tables. Inquiries are received from all over the world. This company is making a specialty of these tables and are pushing them very rapidly into the market, where their success seems now well assured. The three 150 H. P. double drum electric hoists which they are building for the British-American Corporation at Rossland, B. C., are being put together at their works and will be set in operation and put under test previous to shipment. The demand for Denver Engineering Works machinery is now so large as to make it difficult to keep up with the work, and orders have accordingly been placed with several of the best machine tool companies for a new planer, drill press, boring machine and gear cutter, to cost approximately $15,000.

Industrial Notes.

—Wyoming's coal mines are producing 22,000 tons per day.

—Port Townsend, Wash., is shipping pig iron to San Francisco.

—Wages of unskilled labor in California have advanced 25% in the past ninety days.

—Jan. 1st, 1900, is now fixed as the date of completion of the Sierra Railroad to Angels, Cal.

—Los Angeles, Cal., men will build an electric railway between Santa Monica and Redondo.

—At Seattle, Wash., July 31st, the Snoqualmie Falls Power Co. started its machinery.

—The Northern Pacific Railroad Co. will build down the north bank of the Columbia to Portland, Or.

—The Standard Oil Co. is being fought by the territorial government in New Mexico, where the retail price of oil is 30 cts. per gal.

—The Humboldt, Nev., sulphur mines run 70% sulphur. The product in San Francisco is worth $31 per ton. About 1000 tons are annually shipped.

—The Mexican Mineral Railway Co. has been reorganized, and the new corporation proposes to immediately extend the line southward from Monterey to the City of Mexico.

—The '99 meeting of the National Irrigation Congress will be held at Missoula, Montana, September 25th, 26th and 27th. State, municipal and scientific organizations are entitled to send delegates.

—The Mexican Lead Co., with an authorized capital of $7,000,000, was incorporated at Trenton, N. J., this week, to operate lead and other mines in the Republic of Mexico. Capital stock $1,200,000 preferred, and $5,750,000 common.

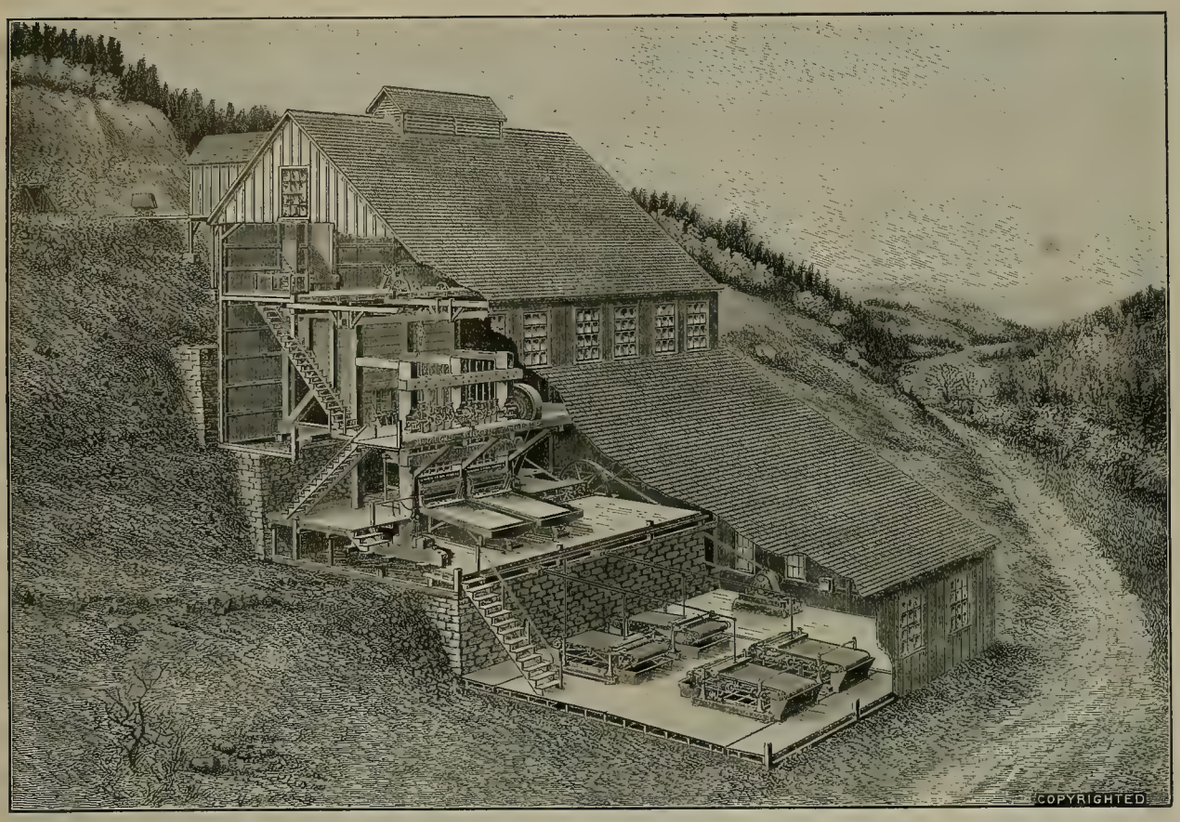
—At Salt Lake, Utah, this week, the Central Pacific Railway Co. was incorporated to acquire the railroad land, land grants and franchises of the Central Pacific Railroad. The capital of the corporation is placed at $87,000,000. Thos. Marshall of Utah is named as president.

—The Standard Electric Co. proposes to establish three power plants—one in Oakland, one in San Jose, one in San Francisco, Cal.—then to distribute electrical power brought from the generators at Mokelumne Hill. It is stated that the company's water supply can develop 35,000 H. P.

—Work was begun this week by the Union Iron Works, San Francisco, on an unusually large merchant steamship for the American-Hawaiian S. S. Co, to carry freight from Honolulu to New York via San Francisco. The vessel will be 415 feet long, 51 feet beam, with a displacement of 12,000 tons.

—The American syndicate, of which the late Calvin S. Brice was the leading spirit, holds a concession from the Chinese Government for the construction of a railroad from Hankow to Canton, and a similar combination of British capitalists owns the right of constructing a line from Canton to Kowloon. For their common advantage these two syndicates have now entered into an alliance for the promotion and protection of their interests.

—The Panama canal is about one-fifth completed; the engineers call for a further expenditure of $100,000,000 before vessels may go from sea to sea. The workmen are negroes from Jamaica and other British colonies in the West Indies, who have been found to endure the climate better than any others, although they would be far from satisfactory as laborers to an American contractor. They are paid $1 a day in Colombian silver, which is worth about 40 cents in U. S. gold.



—The total increase in the exports of manufactures of the United States during the fiscal year just ended, as shown by the figures of the Treasury Bureau of Statistics, is in round numbers $48,000,000, and of this increase $33,000,000 is in manufactures of iron and steel. The total exports of iron and steel and manufactures thereof in the fiscal year '99 were $93,715,951, against $70,406,885 in '98. The exports of manufactures of iron and steel in '99 were more than double those of '96, and more than three times as much as those of '94.

—On July 17th the new treaty between Japan and the United States, negotiated in 1884 by Secretary Gresham, became operative, opening the entire interior of Japan to foreign residents and trade. Hitherto there were only five treaty ports—Yokohama, Nagasaki, Kobe, Hakodadi and Nigata. In these places foreigners have been able to live, to purchase property and to trade; but outside of these they could not even travel without a special permit. These five places are an insignificant part of Japan. Henceforth the entire interior of the Empire, with its populous cities and inviting fields of industry, is thrown open to foreigners. They may live anywhere, engage in any kind of business, and will be assured of protection.

—At the Salt Lake meeting of the subcommittee of the Industrial Commission this week, ex-Congressman C. E. Allen of the Centennial-Eureka mine said his mine used machinery, and he thought everybody connected with the mine was benefited by it. He did not think the Utah mine owners could afford to pay Colorado prices for mining, because the ore there is of a lower grade. He thought the Utah smelters had been benefited to some extent by the shutdown of the Colorado smelters. R. C. Chambers, Supt. Ontario mine, said that the mining interests of Utah were in a thriving condition. He was in favor of an eight-hour law and was fearful of the results of trusts. He thought the smelting trust was a stock jobbing scheme, and that the capital represented by the trust was more than the plants were worth.

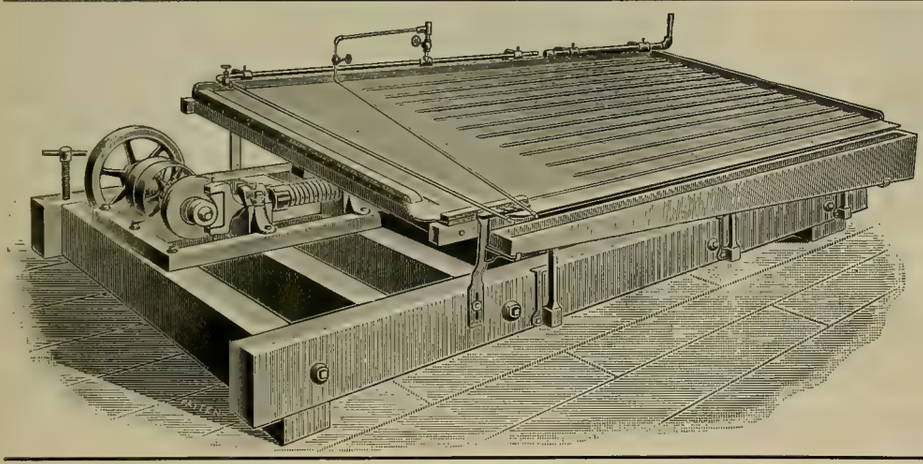
THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes.



The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings.

Thoroughly Protected by Strong Patents. Write for Circular.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. | SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. | CAPACITY FROM 5 TO 10 STAMPS.

GEORGE E. WOODBURY,

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINING AND MILLING MACHINERY.

DOUBLE CYLINDER SINGLE DRUM HOIST.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ¼ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

P&B
BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

Strong Endorsement.

The following testimonials to the non-conducting qualities of the Anti-Caloric Pipe and Boiler Covering speak for themselves:

SAN FRANCISCO, July 21, 1899.

To Whom it May Concern: I thoroughly endorse the insulating qualities of the Anti-Caloric Covering, having had considerable experience with it during a good many years. As an instance of its ability to retain heat, I might say in a recent experiment which I made to test the quality of oil clothing under extreme cold I constructed a box insulated with Anti-Caloric Covering, and used the exhaust from a small engine to do the refrigerating. I had no difficulty in maintaining a temperature within the box as low as 30 degrees below zero, and I feel sure that it is a valuable thing for use in cold storage. Very truly yours, E. A. RIX.

SAN FRANCISCO, Nov. 9, 1898.

Capt. Wm. Borrowe, Mangr. Cal. Anti-Caloric Co., 507 Market St., S. F.—DEAR SIR: Some time ago I requested you to make me a block of non-conducting material for experimental purposes, and you supplied me with two pieces, 12x6x1¾ inches, composed of diatamaceous earth, bonded by asbestos fiber. I subjected one of the blocks to the flame of a gas blowpipe applied directly against it for thirty minutes, and while one side of the block was at nearly a white heat the other side was cool, and the results of this experiment thoroughly demonstrate that these blocks will withstand a high degree of heat, and deter the passage of heat, and will answer the purpose for which they were made admirably. Yours very truly, E. C. JONES, Engineer.

CYANIDE

Peroxide of Sodium

Hyposulphite of Soda

Chloride of Lime

Sulphide of Iron

And other Chemicals for Mining Purposes.

The "Stop for Repairs" to Mining Machinery,

Especially if it is a conveying plant, is a considerable item of expense. Many of these expensive pauses are made to repair or adjust faulty belting. To economize in this respect, use the

LEVIATHAN CONVEYOR BELT.

It is not only adapted to the heaviest service, but will run under any conditions in underground, drippings, extreme heat or cold.

IT WILL OUTLIVE ANY OTHER BELTING.

Mining in British Columbia.

The head of navigation of the Columbia river in British Columbia is at Salmon Beds. Freight and supplies to the mining region are brought to this point by steamer and shipped by pack trains to the various camps. One of the accompanying engravings shows the Delphine Co.'s train leaving Salmon Beds for the mines, twenty miles distant by trail. The Delphine consists of a group of claims on the east side of the north fork of Toby creek. On these claims, according to the report of the Provincial Mineralogist, a vein of solid galena 12 to 36 inches wide has been opened in a series of cuts. This vein occurs in schist. The ore is to be packed to Salmon Beds for shipment to the smelters.

The middle fork of the Spillimachene river is reached by trail from Carbonate Landing, on the Columbia. The trail after leaving the landing passes over the summit to the north fork, below Loon lake, thence climbing over another summit into the valley of the middle fork. The distance is about thirty miles. There are numerous mines and claims along this fork, the most of them at an altitude of 6000 feet or over.

On the middle fork of Spillimachene is Bobbie Burns basin, a wild, rugged, almost treeless tract, surrounded by high, snowclad peaks and ranges. Yet into this fastness the prospector has penetrated and, finding mineral veins, has built himself a home. The principal claim lies at an altitude of 7650 feet. The country rocks are slates and schists. Cutting these rocks is a series of quartz veins 1 to 4 feet wide, which are intersected by a cross-course series of smaller veins at right angles. The veins carry sulphides of iron and lead. A concentration of mineral is usually found at the intersection of the veins.

In 1891 a 5 stamp mill, with 750-pound stamps, was packed into the basin and set up by the Bobbie Burns Co. The mill is still in good condition, in a substantial log cabin on the mountain. The ore is conveyed to the mill by wagon by a road half a mile in length. The mill is well equipped, has automatic feeder, plates, etc. It is a small concern, but serves to illustrate the energy and progressiveness of the men composing the mining communities of the north.

Near Brewer's ranch, thirteen miles south of Windemere, is a series of hot springs, the waters of which as they leave the ground have a temperature of 90° to 120° Fahr. These springs cover an area of several acres and vary in size. The largest would fill a 3-inch pipe under a 10-foot head. The water carries principally calcium carbonate and iron. Calcareous travertine is deposited about the springs.

THROUGH the years thousands of mining men have learned to look to the advertising columns of this paper for information as to where to buy mining machinery and supplies, and it is a constant custom to receive letters of inquiry as to where supplies not so advertised may be had. This week came two inquiries from Arizona from men who want to buy traction engines, two from the same Territory concerning narrow gauge cars, one from California as to "the Babcock gasoline machinery," two from California and two from Oregon inquiring where to buy telephone outfits, two from British Columbia asking for competent hydraulic miners to superintend such work there, one from Wyoming for miners' lamps and one from Montana for electric blasting apparatus.

FOR a time it looked as though the trouble between England and the Boers might be satisfactorily adjusted, but the developments of the last few days in London give the situation a war-like aspect again. Mr. Chamberlain, Secretary of State for the colonies, declares that the grievances of the English people in the Transvaal must be redressed. It is stated in press dispatches that many Uitlanders are leaving the country, going into Rhodesia, Natal and to the Cape for fear of being called upon by the Boers to take up arms in defense of the South African Republic, refusing which, they may be shot as traitors. While, undoubtedly, the reports are more sensational than the situation really warrants, there is a state of unrest, and both governments are secretly preparing for a war which may yet be averted.

A FRENCH COMPANY has recently bought a mine in Wales which had been abandoned by the original owners on the assumption that it was worked out. The new owners are reopening the property, and should they meet with financial success in the operation it will form a striking commentary on English mining methods. The miners of western England have recently made complaint that, despite the great activity in mining elsewhere, their mines failed to attract attention of outside capital. Recent experience in America and in South Africa has demonstrated the necessity of radical departures from the old time-honored methods, good enough, perhaps, in their day, but traditional practices must give place to modern requirements and ideas. Never has there been such a progressive age in mining as at present, and all that is unsuited to modern uses must go, despite the standing that long-continued use and tradition may lend it.

An Unrepealed Law.

The California Legislature intended last March to repeal the law enacted by its predecessor in March, '97, regarding the location of mining claims, etc. From a communication on the opposite page from A. H. Ricketts of San Francisco, and a perusal of the peculiar wording of the Act, it would appear that his exceptions are well taken, that by the jumble of words in the Act the Legislature passed it defeated its own purpose, and that the law of '97 is still on the statute books unrepealed.

As this is a matter of grave import to every prospector and miner in California, the MINING AND SCIENTIFIC PRESS gives it prominence. At the request of this paper, Mr. Ricketts prepared the communication on the next page. Lest it should be accounted a mistake of the State Printer that the Act appears in the shape it does in the official report of the proceedings of the last California Legislature, the MINING AND SCIENTIFIC PRESS sent to the Secretary of State at Sacramento for a certified copy of the bill with the great seal of the State affixed thereto.

This document was duly received and is herewith published:

ASSEMBLY BILL No. 140.

Passed the Assembly, March 3, A. D. 1899.

C. W. KYLE,
Chief Clerk of the Assembly.

Passed the Senate March 15, A. D. 1899.

F. J. BRANDON,
Secretary of the Senate.

This Bill was received by the Governor this 17th day of March, A. D. 1899.

W. I. FOLEY,
Private Secretary of the Governor.

[ENDORSED.]

Filed in the office of the Secretary of State the 28th day of March, A. D. 1899.

C. F. CURRY,
By J. HOESCH, Deputy. Secretary of State.

CHAPTER CXIII.

An Act to repeal "An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of location thereof, amending defective locations, and providing for the deposit of district records with county recorders, and prescribing the effect to be given to recordation of notices of location and affidavits," approved March 27, 1897.

The people of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. An Act to repeal "An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of location thereof, amending defective locations, and providing for the deposit of district records with county recorders, and prescribing the effect to be given to recordation of notices of location and affidavits," approved March twenty-seventh, eighteen hundred and ninety-seven, is hereby repealed.

SEC. 2. This Act shall take effect immediately.

ALDEN ANDERSON,
Speaker of the Assembly.

THOS. FLINT JR.,
President pro tem. of the Senate.

Approved March 20, A. D. 1899. HENRY T. GAGE,
Governor.

No. 300. STATE OF CALIFORNIA—DEPARTMENT OF STATE.

The Great Seal of the State of California.

I, C. F. CURRY, Secretary of State of the State of California, do hereby certify that I have carefully compared the annexed copy of Chapter CXIII Laws of 1899 with the original now on file in my office, and that the same is a correct transcript therefrom, and of the whole thereof. Also, that this authentication is in due form and by the proper officer.

WITNESS *my hand and the Great Seal of State, at office in Sacramento, California, the 7th day of August, A. D. 1899.*

C. F. CURRY,
Secretary of State.

It will be noted that while it was the evident intent of the Act to do away with the Act of March 27th, '97, it does nothing at all. This will be readily seen if the reader of the above will, in reading it, mentally leave out of Sec. 1 of the Act all that is in quotation marks; it will then read "an Act to repeal—approved March 27, 1897, is hereby repealed," which is absurd. Yet it is just what the Act says. It virtually repeals an Act that was never passed; but, by reason of its wording, lets alone the Act that it was intended to repeal. Hence, the conclusion seems incontestable that Mr. Ricketts is right, and that the California law of 1897 is still in force.

Had the word "entitled" appeared to the exclusion of the words "to repeal," as the first three words of Sec. 1, no objection, technical or otherwise, could be made, nor could any flaw be found; but in the form that it appears and which the Secretary of State certifies is correct, it is manifestly of no avail.

In making this matter public the MINING AND SCIENTIFIC PRESS has no other purpose than to protect the California miner and prospector from loss or vexatious litigation resulting from compliance with the supposed statute, this paper merely doing its duty in calling attention to the error as soon as possible. It is our advice that all requirements under the law of March 27th, '97, be followed, for when the matter is brought into the courts, the inevitable decision will be that that law is unrepealed, for, whatever the intent of the legislators, the meaning of the words used and their plain import can alone be given judicial cognizance.

IT is stated that large copper producers realize that a further raise in the price of copper may prove disastrous rather than beneficial, and that they welcome any substitute for copper which will tend to keep the price down. To how great an extent this is true is left to one's imagination. Thus far aluminum is the only metal which has replaced copper to any extent, though a more extended use of it may be anticipated. As yet many look upon the use of aluminum for the transmission of electric power as an experiment, but some large and expensive installations are being made, and when these have fully demonstrated that aluminum is a successful substitute for copper an extensive use of that metal may be anticipated. Aluminum at its present price is cheaper than copper at its present price by reason of their great difference in specific gravity. The supply of aluminum-bearing minerals is inexhaustible, and with a more extended use of the metal the cost of its production is likely to decrease. The largest copper producers of the country seem to have reached their limit of capacity, at least for a long time to come, and there does not appear to be any decided tendency on the part of the great mines to increase it. Doubtless the managers realize the possibility of a lower price, influenced largely, perhaps, by the extended substitution of aluminum wires for copper, and that a heavier output under such conditions would have a tendency to cheapen rather than raise the price of copper. Such additional output would not materially lessen the cost of production. The large producers have exhausted their reserve supply of copper. The Calumet a few years ago had 8,000 tons of the metal in store, which is now all gone into the markets, showing that they are taking advantage of what may be the highest prices to unload.

IN western Kansas some speculative individuals claimed recently to have discovered rich gold and zinc ores in a bed of bituminous shale 200 feet in thickness, which underlaid miles of Ellis and Trigo counties. The alleged discovery was given widespread notoriety and the flat prairie farms quickly rose to fabulous prices, some owners refusing to entertain negotiations at any figure. Now it develops that none excepting the inside ring are able to obtain the high-grade assays and the farmers have returned to the plow and the reaper, the brief mining boom having collapsed as quickly as it formed.

IN Colorado the smelter situation has not apparently improved. The smeltermen still demand the eight-hour day, recognition of the union, and the wages suggested by the arbitration board. The managers still claim their inability to pay this scale of wages without raising the cost of treatment of ore, and refuse to recognize the union. Members of the union have formed a guard about the entrances to the works of the American Smelting Co. for the purpose of preventing new men from applying for employment, which they have thus far apparently succeeded in doing.

A GREAT DEAL has been said of the value of technical education in mining. A finished education is desirable in any walk in life, but in no vocation is a good education more essential to the attainment of the highest success than in mining, but with this must be coupled experience. Through the medium of study, a knowledge of the experience of others is gained; but individual experience, a practical application of knowledge gained by study, is indispensable in the conduct of mining business.

Concentrates.

THE illustrated article "Cooking by Electricity," appeared in the issue of January 15, '98.

IT is stated that the copper production of the great mines of America this year will fall below that of 1898.

MINE operators of eastern Oregon are being warned by Government agents to desist from cutting timber on government lands.

RICH copper ores occur in fossil fish in the permian formation of Russia, and in some parts of the United States, notably Texas.

WHEN a vein passes from one formation into another of unlike character a change is sometimes, though not always, noticeable in the ore.

SILVER LEAD miners of British Columbia are resolving that lead smelted in Canada and refined abroad should be admitted duty free into Canada.

IN some of the old workings of California mines sticks of oak timber are found which were put in forty years ago, and are still in a fair state of preservation.

WHERE wall rocks are too soft to afford firm footing for timbers wall plates of sufficient size and thickness should be inserted between the post or stull timber and the wall.

ABOUT 9,000,000 pounds is the aggregate monthly output of copper of the Anaconda Mining Co., Anaconda, Mont. There are over 1700 men employed; 140 cars of ore are daily handled.

PERSONS who from carelessness or any other cause take mail from the postoffice that belongs to another, and who fail to return the same, are liable to a fine of $500 or one year imprisonment.

THE gold output of the Transvaal in 1897 was $58,000,000, and in 1898, $81,000,000. The strip which produces the greater portion of the gold is thirty miles in length and one to two miles wide.

LIGHTNING seldom interrupts electrical matters in California, but an electrical disturbance in the Sierra foothills last week destroyed over $6000 worth of electrical machinery at Jamestown, Tuolumne Co., Cal.

THE gold mining industry of Brazil is so heavily taxed that there is very little mining of that kind done there. Out of six properties working, but one is paying. In some instances the tax is 5% of the gross output.

TO PREVENT the pounding of water-hammering in heating pipes, a new attachment for warming systems consists of a relief valve with a spring gate inside, which allows the expansion to exhaust itself in the increased area.

ALMOST any mine of value can show specimens which run into the thousands, and in districts producing free-milling gold ores specimens may assay hundreds of thousands, but few of them ever produce a ton of ore of this particular kind.

A BED of gypsum 10 to 40 feet in thickness surrounds the Black Hills of South Dakota. It lies in the Triassic formation. It is locally used in the manufacture of plaster of paris and also of a fertilizer known as land plaster. The deposit is practicably inexhaustible.

THE term unit as applied to ores is used to indicate the amount of a certain mineral contained in the ores, as copper, iron, zinc, lead, etc. The ton weighs 2000 pounds or twenty hundredweight, and a unit is one one-hundredth of this, or twenty pounds. It is 1% of the ton.

MONAZITE has been found in the placers of Oro Fino, Idaho. This mineral is a phosphate of thorium, cerium, lanthanum, yttrium and didymium. The supply comes chiefly from Brazil and it sells for $119 per ton in Germany, where it is used in the manufacture of mantles for incandescent gas burners.

CALIFORNIA prospectors should now observe, as formerly, all details of location of the State law of 1897. It would be well for those who have located claims under the Federal law since March 20 to relocate under the State law and comply with its requirements, thus avoiding possible litigation later.

A CYANIDE leaching vat, made of wood, which had been in use four years, was recently tested as to the percentage of values absorbed. A hole was bored one-half an inch deep into the bottom, the shavings therefrom assaying $13 per ton. Thus, the absorption by wood tanks is shown not to be as great as has been claimed.

STULL TIMBERS should not be placed directly at a right angle with the hanging wall, for the reason that a very small subsidence of the hanging wall will permit the stull to fall down of its own weight. Set them a few degrees above the right angle, and when in that position any subsidence of the hanging wall will make them more firm.

FOR discharge pipe connections in mine shafts flanges fitted with gaskets are better than threaded couplings. Connection can be made or the pipes disconnected more quickly by the use of flanges. Slip joints for steam and discharge pipes are also essential to facilitate handling of the pump. By the use of 20-foot slip joints new connections need be made only at each four sets.

MAGNESITE (carbonate of magnesia), talc and asbestos are refractory substances, and each will withstand a high degree of heat. In Los Angeles Co., Cal., near Lordsburg occurs a deposit of red sandstone resembling tufa and is probably of volcanic origin. This rock, when subjected to the intense heat of an assayer's crucible furnace, shows no further sign of alteration than a slight change in color. The stone is easily worked.

WHEN a claim owner has done the assessment work required by law he should record a certificate with the county recorder setting forth the fact, and he should also post a notice on the claim to the same effect; but should he neglect to record the certificate, if he can produce responsible witnesses to prove that he had performed the assessment work the courts would undoubtedly declare his title good and the claim not open to relocation.

THE proposition to build a dam across the Mojave river, near Victor, San Bernardino county, Cal., is said by Mr. F. H. Newell, Hydrographic Engineer of the United States Geological Survey, to be one of the most feasible of any in the State and one promising excellent results. The depth to bedrock, as determined by drilling, is about 50 feet. The site is at a point where the river cuts through a ridge of granite hills. The rock is firm and admirably suited to the purpose of building a dam.

WHEN about to construct a windlass decide first to what depth you will sink with it before substituting some other machine, then calculate the diameter and length of the windlass so that the necessary amount of rope will go on the windlass with a single lay. When a rope turns back upon itself it is a source of annoyance and sometimes danger. Greater power is obtained by use of a geared windlass, but with a loss of time in lifting a given distance.

THE atmospheric pressure at the sea level is about 15 pounds to the square inch, equal to a column of water one inch square 34 feet high. Pumps do not raise water from this height owing to the fact that it is almost impossible for a mine pump to create a perfect vacuum in its chambers. Friction is also a factor. A mine pump which will raise water from a point 22 feet below its lower valve at an altitude of 2000 feet is doing good work. A very good pump in first-class condition, run slowly, will lift water higher in a quantity far below its capacity.

THE MINING AND SCIENTIFIC PRESS is bought and read every week by mine managers, superintendents, engineers, purchasing agents, foremen and wide-awake, active miners in every part of the region where metal mining is carried on. Its readers have bought mining machinery and supplies to the extent of $100,000,000 in the last ten years, and their present average annual purchases exceed $15,000,000. Its advertising pages are referred to everywhere by intending purchasers of mining machinery or supplies as a comprehensive directory for that purpose.

ON some Minnesota mining ranges iron ore of good quality is mined in open pits with steam shovels at a cost of 5 cents per ton. The ore is put into hopper cars, transported to docks and dumped into pockets at a further cost of 5 cents per ton. From the pockets, chutes, spaced to correspond with hatchways in boats of 2000 to 7000 tons capacity, load the ore at the rate of 1000 tons an hour. One boat under steam tows several others to the lower lake ports where the ore is quickly hoisted into 50-ton steel cars and sent on its way to the blast furnace, where it is made into pig iron for the cupola or puddling furnace; or it is put through the Bessemer converter or the open-hearth furnace and comes out steel of a quality superior to that of the iron which it has superseded.

THE Commissioner of the General Land Office has rendered an interesting decision in the case of the South Dakota Mining Co. vs. Jesse D. McDonald. Both parties claim the land on which is situated the entrance to what is known as the Wind Cave, which has already become noted for its wonders of crystallization of minerals. The Commissioner decides that the land is not mineral-bearing and is not subject to location as such. He also says McDonald, who located the land as a homestead, has failed to show good faith and therefore forfeits his claim. He recommends that the cave be reserved by the Government as a public resort. McDonald has made no attempt to farm the land, which is among rocky hills, but has taken in considerable money from visitors, from whom he exacted $1 each for a visit to the cave.

THE glacial drift which swept down from the northward and covered the Canadas, New England and Middle States, and extending as far westward as Minnesota, brought with it large masses of rocks, unfamiliar in the region where they are now found. In New Jersey huge blocks of granite are found resting on the red sandstone of the Triassic. In central Ohio considerable masses of pure copper have been found which undoubtedly were detached from the mass deposits of the Lake Superior region and transported on the ice sheet several hundred miles and dropped where found. The underlying rocks of the drift area have been planed down, scoured and in some places polished. Some of the harder rocks still show the markings of the glacier, and in places where excavations have been made in gravel beds and clay banks there have been found several series of striæ, indicating the changing direction of the flow from time to time, the later striations not having obliterated the earlier.

THERE is a difference between a vein and a zone. A vein, whether large or small, has clearly defined limits, whether all the material between the walls be ore or not. A zone is not necessarily sharply defined by walls, the mineral occuring along a considerable longitudinal extent in a more or less irregular manner. The masses or bunches of ore may or may not be connected. Either a vein or a zone may lie horizontally or stand vertical, or at any intermediate angle. A flat vein is not necessarily a blanket vein. By a blanket vein is meant a sheet or deposit of ore in a sedimentary formation, which is the result of replacement or impregnation. When one wall is composed of eruptive rock it is called a contact. This was the original meaning of contact vein, but it has since been miscellaneously applied to veins and deposits occuring between wall rocks of unlike character. The fact that a vein occurs at such contact does not indicate value, as there are veins of great value occuring between walls of the same formation.

A Law That Has Not Been Repealed.

The California State Mining Act of 1897 is generally supposed to have been repealed during the last session of the California Legislature. Such, in my opinion, is not the fact; but, on the contrary, that the California State mining law, unaffected by any action of the last Legislature, is still in full force and effect and that locators of mining claims should comply with all of the provisions of the Act of 1897 in order to invest themselves with title to such claims. That locations made since the 20th day of March, 1899, (which is the date of the so-called repealing Act) under the assumption that the manner of acquiring lode or placer claims was since that date entirely regulated by the United States law and the local rules, regulations and customs of miners not inconsistent with the Federal law, are subject to relocation the same as if no location thereof had ever been made. This is stated without any expression of opinion as to the California State mining law (of 1897) itself.

It appears that during the last session of the Legislature the following Act was passed, viz: An Act entitled "An Act to repeal 'An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of location thereof, amending defective locations and providing for the deposit of district records with county recorders, and prescribing the effect to be given to recordation of notices of location and affidavits,'" approved March 27, 1897.

(Approved March 20, 1899.)

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. An Act *to repeal* "An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of location thereof, amending defective locations, and providing for the deposit of district records with county recorders, and prescribing the effect to be given to recordation of notices of location and affidavits," approved March twenty seventh, eighteen hundred and ninety-seven *is hereby repealed.*

SEC. 2. This Act shall take effect immediately. (Stats. 1899, p. 148.)

This Act, in my opinion, is void. There is no ambiguity in its language. It purports to repeal an Act which repealed an Act commonly called the "State Mining Law," when, in fact, no such repealing Act (which is apparently sought to be repealed) ever existed. That is the Alpha and the Omega of the statute. No relief can be afforded except by further legislative action, as any departure from the clear language of this statute would be, in effect, an assumption of legislative powers by the courts.

Possibly the motive of the Legislature in passing the quoted Act was to wipe the State mining law from the statute books; but the Legislature did not say so, and Judge Wallace, in the case of Harpending v. Haight, (39 Cal., 189), has laid down the rule that the motive of the Legislature in passing a legislative Act is not a proper subject of judicial inquiry.

The language of the Act in question is explicit; it has a definite and precise meaning; there is no room for construction; it must, therefore, under the rules of the construction of statutes, be presumed to declare the intent of the Legislature, and the courts cannot go outside of it under pretext of interpretation to cure any supposed blunder of the Legislature; and it is glaringly obvious that the Legislature has blundered in this instance, in attempting to repeal a repealing Act which is yet to be passed.

It is not the province of a court to act upon conjecture, and surmising what may have been the intent of the Legislature in passing the said Act, to say: omit the words "to repeal" found in the first line of Section 1 of the statute, nor to say: insert in lieu thereof the word "entitled" after the words "an Act" on said line, which is all that would be necessary to give the statute the effect claimed for it, but which it does not possess.

Moreover, the Code of Civil Procedure of this State (Section 1858) provides that "In the construction of a statute the office of the judge is simply to ascertain and declare what is in terms or in substance contained therein, not to insert what has been omitted, or to omit what has been inserted." In other words, a court has not the power to make a new statute by supplying omissions therein. The language of the court in the case of Woodbury v. Berry (18 Ohio St., 462) is apposite. In that case it is said: "But, notwithstanding all this, *ita lex scripta est.* The language as it stands is clear, explicit and unequivocal. It leaves no room for interpretation, for nothing in the language employed is doubtful. We are satisfied, by considerations outside of the language, that the Legislature intended to enact something different from what it did enact; but it did not carry out its intentions, and we cannot take the will for the deed. It is our legitimate function to interpret legislation but not to supply its omissions." (Quoted approvingly in City of Eureka v. Diaz, 89 Cal., 469).

This doctrine is not limited to that particular case, but is found in many American and English cases. In the case of City of Eureka v. Diaz (89 Cal., 469) our Supreme Court says: "It is a cardinal rule in the construction of statutes that the intent of the Legislature should be followed, but this is subject to the imperative and paramount rule that the Court can not depart from the meaning of language, which is free from ambiguity, although the consequence would be to defeat the object of the Act." In the course of the opinion the Court quotes approvingly the language of the Supreme Court of Maryland in the case of Smith v. State (66 Md., 217) as follows: "Even when a court is convinced that the Legislature really meant and intended something not expressed by the phraseology of the Act, it will not deem itself authorized to depart from the plain meaning of language, which is free from ambiguity. As was said by Lord Denman in Green v. Wood (7 Ad. & E. N. S., 185), 'Those who used the words thought they had effected the purpose intended. But we, looking at the words as judges, are no more justified in introducing that meaning than we should be if we added any other provision. We can do no more than give such a meaning as the words authorize.'"

Therefore, no elimination of the words "to repeal" will be indulged in by the courts nor apt words be inserted to give the statute discussed here a different meaning than its language plainly imports.

The language of the Act is plain and admits of but one meaning, viz., that its purpose is to repeal an Act repealing "An Act prescribing the manner of locating mining claims, etc.," and the rule is well settled that in such an event an Act must receive that meaning, although such construction leads to results which are absurd.

Neither is the Act in question helped out by its title, because the title of an Act can never control the plain intent, as the same is expressed in the Act itself, for it is only when the meaning of the language employed in the body of the Act is doubtful that the title, taken in connection with other parts of the statute, may be resorted to for the purpose of removing ambiguity. (*In re* Boston Mining & Milling Co., 51 Cal. 624.) And as the language of the Act is free from doubt, capable of being read and understood, expressing plainly and distinctly the sense of the framers of the Act, it is only, seemingly, a question of time when the courts will declare the so-called repealing Act inoperative and the Act of March 27, 1897, to be undisturbed by its passage.

It is proper for me to add that any views of mine upon the foregoing subject which have heretofore been published were given before I had an opportunity of examining this statute, and were given upon the assumption that I was correctly informed of its repeal.

Chairman Mineral Land Committee
Cal. State Miners' Association.

San Francisco, August 10, 1899.

Notes on the Oil-Yielding Formations of California.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by W. L. WATTS, assistant in the field to the State Mineralogist.

Conditions Under Which Petroleum is Found in California.—It is not within the scope of this article to discuss the vexed question as to the origin of petroleum, for it has been ably and exhaustively treated by A. S. Cooper*, State Mineralogist, as well as by other writers. In California, petroleum is found in formations ranging from the Lower Cretaceous to the Quarternary. In different localities this mineral has accumulated in different geological horizons. The manner in which these accumulations are distributed suggests that in the first instance the accumulation was occasioned by natural distillation, although there is but little doubt that other causes have contributed to the formation of petroleum deposits. In California petroleum is found in shales, limestones, sandstones and conglomerates, and in a few instances granitic and eruptive rocks are found impregnated with this mineral; but in nearly all of the productive wells the oil is found saturating sandy strata. In this State the folding of the rocks has brought these oil-soaked strata near the surface, and the oil lines or lines along which remunerative wells can be obtained extend in length parallel to the axis of folds or to the lines of faulting. The oil lines extend in breadth only a certain distance down the limbs of the folds or down the block of tilted strata, which has been isolated by faulting. The lateral extent of the oil line is limited at its upper side by the outcrop of the oil sand, or a line of geological disturbance such as a fault, or the axis of the fold on which the oil line is situated. On its lower side it is limited by the dip of the formation, which carries the oil-yielding stratum to too great a depth for it to be profitably reached by the drill, or, where the oil sand is struck below a certain depth, it may be found that water has driven out the oil and taken its place.

Methods by Which the Strike and Dip of Oil-Yielding Strata Should be Determined.—As geologists and oil men know, the dip and the strike of the oil sand are of the greatest importance in locating the site of an oil well, and in the case of prospect wells the dip and the strike have to be ascertained from the exposed rocks.

Many people are not familiar with geological terms, therefore it is in order to describe what is meant by the dip and the strike of a stratum of rock, and to give simple methods for determining the conditions represented by these terms.

The dip of a stratum of rock is the angle which its surface, when inclined, makes with the horizon. The strike is the horizontal direction in which a stratum of rock extends, and is always at right angles to the dip. Therefore, if the direction of the dip is known the strike can be readily determined.

The direction of the dip of an inclined stratum corresponds to a line drawn along the inclined surface in the direction of its greatest inclination, and it is always at right angles to the strike.

The following is a simple method for determining the dip of exposed strata with sufficient accuracy for practical purposes:

In Fig. 13 let *P Q D C* represent the surface of an inclined stratum. It is required to determine the

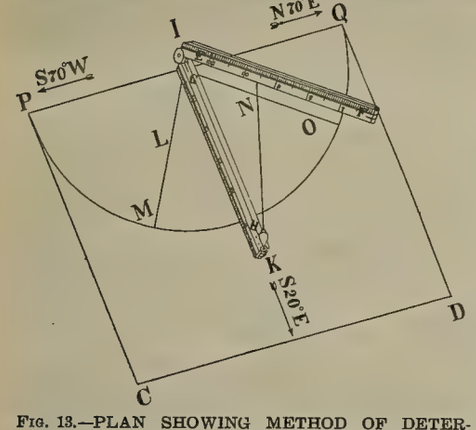

FIG. 13.—PLAN SHOWING METHOD OF DETERMINING DIP OF AN INCLINED STRATUM.

direction in which it dips, and the angle at which it is inclined.

If a plumb bob be suspended from a partly open rule, as shown in Fig. 13, and the open ends of the rule be turned in the direction of the dip until the plumb line forms one side of a triangle with the two limbs of the rule, then the lower limb *G H* is lying in the direction of the dip; for the plumb line will only complete the triangle with the limbs of the rule when its lower limb is placed on *I K*, the line of greatest inclination of stratum *P Q D C*. This can be seen by turning the rule so that limb *G H* falls on line *L M*, or *N O*, neither of which is the line of greatest inclination of the stratum. It will then be seen that while the limb *G H* is in either of these positions, or any other position except the one which coincide with line *I K*, the plumb line and the limbs of the rule will not form a triangle.

If *E F*, the upper limb of the rule, be placed in a horizontal position, and the lower limb *G H* on *I K*, the line of greatest inclination, the side of the triangle formed by the plumb line will be opposite the angle of the dip. The value of this angle may be found from the two sides of the triangle formed by a portion of the upper limb of the rule and the plumb line.

The angle of the dip may also be ascertained with approximate accuracy by carefully laying the rule, opened as explained in the preceding paragraph, on a piece of paper, drawing the angle and measuring it with a protractor.

Some rules are furnished with a clinometer scale, by which the angle formed by the open limbs of the rule is indicated.

It will be apparent to mathematicians that if the upper side of the triangle be considered a radius the plumb line will be tangent of the angle of the dip; and if the hypothenuse, *i. e.*, the lower side of the triangle, be considered as radius, the plumb line will be the line of the angle of the dip.

As previously mentioned, the strike is always at right angles to the dip. Thus in the case of stratum *P Q D C*, if the direction of the dip, as shown by line *I K*, is found to be S. 20° E., the strike will be represented by line *P Q*, at right angles to line *I K*, and the stratum will extend in a horizontal direction with a strike of S. 70° W., or N. 70° E.

Care should be taken that the surface of the stratum, the dip of which is to be ascertained, really is a bedding plane. It must also be borne in mind that the bedding planes are seldom true planes, as they are subject to many inequalities.

Therefore, if possible, the dip should be estimated at several places on the same stratum, and the average of the results taken as the dip. In estimating the dip of a stratum of rock by this method, it is well to clear off a space on the surface of the stratum, and to lay thereon a board, thus getting a better surface on which to work.

When a remunerative oil-yielding stratum has been discovered, its strike and dip should be determined by drilling three wells according to the following method:

In Fig. 14 let *A*, *B* and *C* be three wells in which the oil sand has been respectively struck at 100,

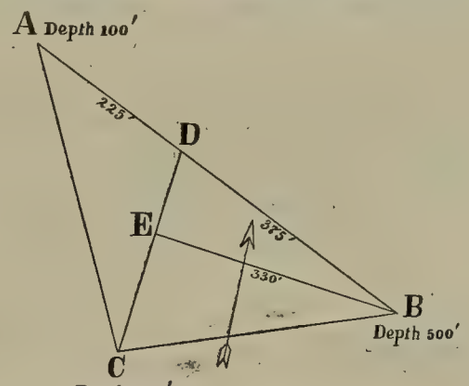

FIG. 14.—PLAN SHOWING METHOD OF DETERMINING DIP OF OIL-YIELDING STRATUM.

500 and 250 feet below any datum plane, such as a horizontal plane touching the top of well *A*. Draw *A B* and let it represent a distance of 600 feet. If a point be found between wells *A* and *B*, at which the oil sand can be struck at a depth of 250 feet below datum, a line drawn from well *C* to that point must necessarily be drawn along the strike of the formation; and if a line be drawn at right angles to the strike of the formation and towards the deepest well, that line will necessarily be drawn in the direction of the dip of the formation. Moreover, the figure contains the elements from which the angle of the dip may be calculated.

The question is at what point along the line *A B* will a well strike the oil sand at 250 feet below datum. The distance *A B* is 600 feet; the difference in the depth of wells *A* and *B* is 400 feet, therefore the grade of the surface of the oil sand between *A* and *B* is 400 feet in 600 feet, or 2 feet in 3 feet. Hence wells situated along line *A B*, and sunk to strike the stratum of oil sand, would, if measured from the datum plane, increase in depth as well *B* was approached, and the depths would be in proportion to the distance from *A* measured along *A B*.

It is required to find a point along the line *A B* at which the oil sand may be struck 250 feet below this line, or 150 feet deeper than at *A*. Since the increase in depth of wells which may be sunk from the datum plane to the oil sand along the line *A B* is at the rate of 2 feet in depth to every 3 feet of horizontal advance towards *B*, the distance from well *A* to the required point will be to the increase of depth of well at the required point as 3 to 2, or one and one-half times 150 feet, which is 225 feet. Lay off *A D*=225 feet. As point *D* is 225 feet distant from well *A*, along line *A B*, a well sunk at point *D* will strike the oil sand at a depth of 250 feet below datum. Hence a line drawn from *C* to *D* will give the direction of the strike of the oil-sand stratum.

Or the proposition may be stated thus: The grade of the stratum of oil sand between wells *A* and *B* is 400 feet, (the difference between the depths of the wells at *A* and *B*) divided by 600 feet (the distance between the two wells), which gives two-thirds of a foot in depth to 1 foot along *A B*. Dividing 150 feet (the difference of depth of wells *A* and *C*) by two-thirds of a foot, we obtain the distance 225 feet, which is the distance *A D*. Therefore, if a well were sunk at *D*, the oil sand would be struck at a depth of 250 feet. Draw the line *C D*. Now it is evident that a well sunk at any point along *C D* would strike the oil sand at a depth of 250 feet. Hence, as before stated, the line *C D* is the direction of the strike of the oil sand stratum. Moreover, any line drawn at right angles to line *C D* and in the direction of the deepest well will be drawn in the direction of the dip of the formation.

It is now required to find the angle at which the oil sand dips, and this can be found as follows: From *B* draw *B E* at right angles to *C D* (the line of strike). This line *E B* is the direction of the dip of the formation. By measurement, we find that line *E B* is 330 feet in length. If a well were sunk at point *E*, it would strike the oil sand at a depth of 250 feet below datum. Therefore, the grade along the surface of the oil sand in the direction of *E B* is 250 feet in 330 feet; and this grade represents an angle of about 37°. If the meridian be represented by the arrow in Fig. 14, then the oil sand penetrated by the wells *A*, *B* and *C* dips S. 80° E., at an angle of about 37°, and, consequently, the strike is N. 10° E.

Method for Calculating the Position of the Outcrop of Oil Sand.—When a remunerative stratum of oil sand has been struck and the angle at which it dips has been ascertained, as shown in the foregoing paragraphs, the distance from any of the wells, as *B*, to the point at which the oil sand ought to crop out at the surface of the ground, if it were on a level with the datum line, can be determined. This is done by the following method:

Let Fig. 15 represent a vertical cross-section drawn through the ground plan of Fig. 14, along line

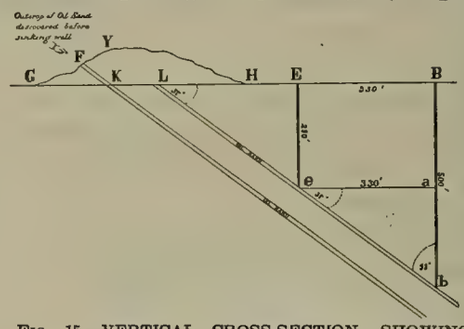

FIG. 15.—VERTICAL CROSS-SECTION SHOWING METHOD OF DETERMINING POSITION OF OUTCROP OF OIL-YIELDING STRATUM.

B E, and extended along the line of dip towards the outcrop. Let *B b* represent 500 feet, the depth of well *B*, and let *E e* represent the depth of a well, which, if sunk at *E*, would strike the oil sand at a depth of 250 feet, as explained in a preceding paragraph. It is required to find the point at which the stratum of oil sand, struck in well *B*, ought to crop out at the surface of the ground, provided the surface were on a level with the datum line and not covered with alluvium. Through points *b* and *e*, or the top of the oil sand stratum, draw *b e*, and extend it until it cuts the datum line; the point where it cuts this line is at *L*. If the distance between *B* and *L* be measured, it will be found to be about 660 feet, which is the distance between well *B* and the outcrop. If the surface of the ground sloped upward from the datum line, as indicated by the outline *H Y*, it is evident that the oil sand would crop out at a point above the datum line. This point can be found by extending line *b L* till it strikes the surface. It is obvious that if the surface of the ground sloped downward from any point, such as *H* on the datum line, the outcrop would be below the datum line.

The angle at which the oil sand dips, and the distance from well *B* to the outcrop, may be found by measurement and the simple methods already given, with sufficient accuracy for practical purposes. But, if a closer estimate is desired, it can be obtained by the following trigonometrical formulas:

From the right angled triangle *a e b* (see Fig. 15) of which *a e* = 330′ and *a b* = 250′, we have:

Cot. of angle of dip (*a e b*) = 330 ÷ 250 = 37° 8′ 48″.

From the right angled triangle *B L b*, of which *B b* = 500′ and angle *a e b* = angle *B L b* = 37° 8′ 48″, we have:

B L = 500 × cot. 37° 8′ 48″ = 660′.

That is to say, the distance from the well to the

*MINING AND SCIENTIFIC PRESS, Feb. 4, 1899.

point where the oil-sand stratum intersects the datum plane equals the depth of the well multiplied by the cotangent of the angle of the dip.

If in the first instance an outcrop of oil sand had been discovered at point *F*, and well *B* had been sunk to strike it, then it becomes important to determine whether or not the previously discovered outcrop of the oil sand is identical with the outcrop of the oil sand as determined by calculation. It has been found that the angle of the dip would cause the oil sand struck in well *B* to come to the surface at point *L* or *Y*. Therefore it is reasonable to suppose that the discovered outcrop which comes to the surface at *F* represents a stratum of oil sand underlying that penetrated by wells *A*, *B* and *C*.

If an outcrop of oil sand had been discovered at *F* and well *B* sunk, and oil-sand had been struck at 500 feet, it would naturally be supposed that the oil sand stratum discovered at point *F* had been reached. If struck a little sooner than expected, it might be accounted for on the supposition that there is some irregularity in the dip; but when three wells are sunk and the dip, calculated by the method of triangulation already explained, shows that the stratum of oil-sand struck in wells *A*, *B* and *C* ought to appear at *L* or *Y*, it is presumptive evidence that the outcrop of oil sand discovered at *F* is a stratum underlying that penetrated by the wells. When no outcrop of oil sand has been discovered, it is important to find out where the outcrop ought to be in order that some idea may be had on the ground, as to the width of that portion of the oil line which lies between the well and the outcrop.

In all these calculations everything must be reckoned with reference to a common datum, which is preferably the horizontal plane passing through the highest or lowest part of the oil field in which the calculations are made. Oil fields should be developed by this method of triangulation or some modification of it. In the development of an oil field in California it is expected that many cases will occur where the calculations will not check with the results, for the reason that there are irregularities in the formation; but taken as a whole progress by triangulation is the only safe method of procedure.

It will be evident to mathematicians that the calculations herein set forth may be made by various formulas.

From the foregoing paper it will appear that, although the element of risk is inseparable from petroleum mining, it is greatly diminished by competent and careful preliminary work, consisting of:

First—A study of the structural geology of the locality wherein operations are to be conducted.

Second—By following a systematic method of triangulation for determining the strike and dip of the oil sand, and the site of new oil wells.

When a remunerative oil line has been discovered it should be developed gradually; and in districts where there has been much geological disturbance, it is better to limit the distance between wells to about 300′.

If oil lines are discovered on both sides of an anticlinal fold, it is well to develop them simultaneously, by which means a correct idea as to the structure of the fold may be obtained.

By prospecting and developing territory on the lines mentioned in this paper, in most instances, a few wells may be so located that they demonstrate the value of the territory; whereas wells drilled without due regard to the geological conditions of the locality only demonstrate the value of the rocks they actually penetrate, and several wells may be drilled which prove the same fact over and over again, instead of the group of facts on which the value of an oil field depends.

Boring Holes in Soft Ground.

Where rock, such as granite, diorite or other massive rock, has become much decayed by weathering or by the action of underground mineral solutions, and is so soft as to give much trouble in drilling, holes may be bored far more rapidly than they can be drilled. For this purpose take an old mill auger or bit such as is ordinarily used by carpenters. If it is too short, weld on a piece of sufficient length. An inch bit is large enough for practical purposes. The bit should be split at the bottom and the ends turned out slightly (one-eighth inch) in opposite directions. The shank should be fashioned by the blacksmith into a form resembling a brace so that it may be used as a brace and bit. On the end opposite the bit a block may be fixed by boring a small hole in it the size of the iron rod. Having selected the spot for putting in the hole, the block is placed against the breast of the operator, who, with his hand, turns the bit by means of the crank-like arrangement formed by the four right-angled turns of the rod. The bits will cut more or less rapidly according to the nature of the rock, and the drillings are discharged automatically by the spiral shape of the bit. This has been found to work admirably in soft, wet ground where a hole could not be drilled, owing to the continued caving of the hole.

A Los Angeles Co., Cal., Mine.

Written for the MINING AND SCIENTIFIC PRESS.

A remarkable ore is found in a vein known as the Kelsey mine in the San Gabriel canyon in Los Angeles Co., Cal. The mine is eight miles above the village of Azusa. The ore is rich in silver and contains considerable of the native metal.

The country is almost wholly made up of metamorphic rocks, having a schistose, gneissoid, or massive structure. Both hornblende and mica occur in these rocks, the former being found frequently altered to chlorite and the latter by further alteration has in part passed into epidote.

Dykes of porphyritic rock have been intruded into the crystalline schists. In the immediate vicinity of the Kelsey vein are found intrusions of a dark green, much decomposed and shattered rock, which is probably diorite. Faults both great and small are numerous throughout the region. Within a few hundred feet of the mine is a great fault which can be readily seen. The displacement reaches several hundred feet and has resulted in bringing in contact in a horizontal plane on the opposite sides of the fault, rocks of entirely dissimilar character. On the south side of the fault the rocks consist of a series of regularly bedded micaceous sandstones, more or less schistose and having a light gray color, or where oxidized the small amount of iron present has given them a buff color. These rocks dip east at an angle of 20° to 30°. On the north side of the fault the rocks are harder, of dark gray color and contain hornblende in place of mica. They are more gneissoid or massive than schistose. The dip is less regular than the sandstones on the opposite side of the fault. In this formation are numerous large, lenticular masses of quartzose and feldspathic rock, which may possibly represent local segregation of the contained minerals. There is much more evidence of disturbance on the north than the south side of the fault. It is in the disturbed area that the Kelsey vein is found. The vein is a fissure and occupies the line of a fault plane which at first was perhaps a crack, but which has become enlarged by the movement of the rock masses upon themselves, resulting in the crushing and grinding of the rocks and the formation of a convenient channel for the passage of mineral waters and excellent conditions for the deposition of minerals from the mineral waters, and this is what has evidently occurred.

The vein consists chiefly of heavy spar (baryta), with carbonate of lime (calcite) and some quartz. The associated minerals are cobalt bloom (erythrite), a hydrous cobalt arsenate; nickel arsenate (annabergite); carbonate of copper (malachite); silicate of copper (chrysocolla); iron oxide and black oxide of manganese. The silver occurs native and as glance (argentite) and possibly to a limited extent as chloride, and in various combinations with sulphur, cobalt and arsenic. Galena occurs sparingly in small, disseminated crystals.

A clay selvage usually separates the vein from the walls, this feature being particularly noticeable on the footwall side. In places a soft, clayey gouge constitutes the entire vein filling. In width the crevice varies from a small seam to more than 4 feet.

The rocks enclosing the vein differ in various parts of the mine; a much decomposed rock containing iron in the form of carbonate occurs frequently. The dyke of dark, basic rock resembling diorite, previously referred to, is exposed at numerous places throughout the workings, often in contact with the vein or close to it. A more or less schistose to massive chloritic rock is also found, which may represent a phase of the dyke rock.

Since its formation the vein has been subjected to torsion and displacement. A nearly vertical fissure crossing the strike of the vein at right angles has displaced the rocks on the south side of the fault and resulted in giving the vein a curving strike.

Most of the ore extracted from the workings has been of high grade, usually running over $200 per ton and small lots sometimes running into thousands. At one time the late Dr. Endlich made some very interesting experiments with the rich cobalt and nickel ores. The ore taken for these experiments contained 7% to 15% cobalt, 2% to 3% nickel and from 1000 to 1400 ounces silver per ton. The ore was crushed through a 20-mesh sieve, mixed with sufficient litharge to produce an 8% charge, and enough borax added to take up the gangue (heavy spar, quartz, calcite, magnesia and iron). Carbonate of soda and flour were added to the charge. When the percentage of arsenic in the ore was sufficiently high to form speiss none was added, otherwise metallic arsenic was mixed in some sulphides in the ore, and reduced sulphur from the heavy spar was utilized to produce mattes. The mixture was melted in large black lead crucibles, the slag poured off and the metallic product allowed to cool. The bars obtained were composed of lead, silver, cobalt, nickel, arsenic and sulphur, principally, the lead being in the form of sulphide, the cobalt and nickel in the form of arsenides. The bars contained from 4500 to 7000 ounces silver per ton. The slag contained a trace of silver and averaged about 0.75% cobalt which, when desired, could be reworked by arsenizing and the cobalt obtained in the resulting speiss. S.

Some Experiences of a Working Miner,

NUMBER XXVIII.

Written for the MINING AND SCIENTIFIC PRESS.

Several men were earnestly engaged in conversation in L—— A—— one day, and as the controversy did not appear to be of a private nature, I approached, knowing most of them, and listened. One of the party, an elderly gentleman, was telling, with much detail and emphasis, of the wonderful wealth discovered some years previous by a party of prospectors in N—— M—— or A——, near the line. Several nuggets were picked up on the surface, he said, weighing $20 to $80, and they had a large amount of small nuggets and fine dust. The mines had been discovered through the agency of a friendly Indian for whom A——, the leader of the prospecting party, had done a favor—saved his life, I believe. As every one in the West knows, the proper thing for an Indian to do who feels that he owes his life to the man who saved him, is to show him a rich gold mine, and this grateful Indian was no exception. A—— and his party had been conducted to the gold field, and, though they knew they were going on a mining trip, strangely failed to provide themselves with the necessary mining paraphernalia; but this made little difference to the success of the expedition. They worked vigorously, packed dirt down the hill several hundred feet to a stream and washed the earth in a frying pan. Notwithstanding these crude methods, they soon accumulated half a bushel of gold, and had not made a good start. One day one of the men left camp for something and went several miles along the mountain. Returning toward evening and nearing camp, he thought it unusually still and decided to investigate. He cautiously approached a spur on the hillside, on the farther side of which was the camp. Reaching this, he looked around a projecting boulder and was horrified to see the cabin a mass of smouldering ruins; his companions were lying about on the ground with arrows sticking in them until they resembled pincushions. The lone survivor remained in concealment until nightfall, and then going to a certain tree where he had buried an $80 nugget, made his way out of the country and eventually to L—— A——, where he sold the nugget.

The little party listened to this recital with marked interest, and when the gentleman had finished, one of them asked:

"Can this place be found again?"

"It can," was the reply; "but there is only one man who knows the locality."

"And who is he—where can he be found?" was asked.

The first speaker looked knowingly, and smilingly said:

"He can be found when wanted."

"Suppose we organize a party," said another speaker, "and go out to these lost mines. What would it cost?"

"It will cost," said the first speaker, "$2000, and every man furnish his own outfit."

These men actually commenced to talk "business." In a few days a party was organized and a friend of mine was a member of it. He, however, intended to make arrangements with an Indian whom he knew to surreptitiously leave the outfit when the party had reached the mines and telegraph to me; I was to have a large party ready to move at once into the Indian country and take possession of all the territory not already located. A day or two before the time appointed for leaving, the leading spirits of the expedition disappeared, and my friend informed me that they had left without notice, evidently intending to go ahead of the others. All hope of finding where they had gone was lost, and a score of anxious men felt that they had been dealt with unfairly. Several weeks passed, and one day a member of the party that had left was seen on the streets. The following day the others put in an appearance. When questioned, they were at first reticent; but finally they were unanimous in condemning the man who first told the stories of the great wealth of the lost A—— placers.

One would scarcely think that a score or more of men would be so easily taken in; "but distant fields seem green," and this lost placer in the heart of a hostile Indian country was too much for them, and some members of the party were so anxious to corral the whole field that they even did not treat their associates honorably. Like most lost-mine fables, it turned out to have no foundation in fact whatever.

* * *

The B—— H—— mines were much talked of, and eventually attracted the attention of capital. A company took the property, expended a large amount of money, had plans for a large mill drawn and were about to order the machinery, when, for some reason, an experienced mine manager was sent to make an examination. He reported value but insufficient development, and finally recommended a small mill for experimental purposes. This was built; but it was with difficulty that sufficient water was obtained to supply the small mill. Not much was ever said about this enterprise, for the reason, probably, that the large mill was not built. Still, the property has great prospective value, if sufficient water can

be obtained. This simply is another illustration of the way investors will plunge into extravagant purchases of machinery, etc., without first investigating the surroundings. A mill alone would be of little use if no water were available to work the ore.

Characteristic Mines of the California Gold Belt.

NUMBER X.

Written for the MINING AND SCIENTIFIC PRESS.

As stated in a previous paper, the central gold belt in Calaveras county spreads out in the neighborhood of Angels to a width of about three miles, extending from the Star of India on the west to the Birney ranch on the east. At the latter place the diabase and diorite rocks, and the amphibolite schists due to their alteration, are in contact with rocks of a different character and represented by types of diorite and other hornblendic rocks unlike any occurring in the area to the westward.

As the amphibolite schists are important in this section, being intimately associated with the gold-bearing veins and being in places gold bearing, a more detailed description should be given of them. F. L. Ransom, of the United States Geological Survey, thus describes these rocks: "The characteristic mineral of these schists is a green fibrous hornblende, but quartz, in the form of a fine mosaic of interlocking grains, plagioclase, feldspar, chlorite, epidote, biotite, white mica and calcite are all abundant constituents in varying proportions. Occasionally the augite and plagioclase of the original rock occur. These amphibolite schists were evidently derived from the various forms of more or less basic igneous rocks."

In several counties of the gold belt the writer of these articles has collected series of rock specimens which show perfectly and conclusively the transition of massive diorite and diabase over to amphibolite schist.

The Birney mine is one of the most easterly of those which may properly be included in the central belt, though other veins occur in the hornblendic rocks referred to in the area lying to the eastward, and not far distant the rocks of the older Calaveras formation are found. The Birney mine is situated on a low hill one and one-half miles northeast of Angels. The rock is a granular diabase of almost normal type, but altering to amphibolite schist near the veins, of which there are a dozen or more within a distance of 200 feet. Most of these veins are gold-bearing, and in depth simple veins have developed characteristics similar to some of the mines near Angels, viz., a splitting up of the vein with increasing width of quartz, a silicification of the amphibolite schist and the occurrence of auriferous pyrite throughout. Sufficient development work has not been accomplished to determine whether the several veins found on the surface will bear any relation to each other in depth or not.

Not far from this mine in a grano-diorite area, lying to the eastward, the granitic rock is found to be gold-bearing and contains large cubes of auriferous pyrite. The occurrence is of geological interest only. In the area between the Birney ranch and the large mines at Angels are several gold-bearing veins upon which a limited amount of prospecting has been done. West of Angels are numerous claims in which are veins and zones of gold-bearing rock. One of the notable features of the zones or mineral veins in this locality is that the schistose rock as well as the quartz is auriferous. When this occurs it may always be observed that, no matter how completely the original rock has been altered structurally by the compression and shearing to which it has been subjected, it is always more or less silicious.

In the Smith's Flat region, or that section lying west of the Madison-Gold Cliff vein and extending to the Star of India, the veins all bear a certain similarity, occurring as lenses or masses of quartz in splintery, schistose or slaty diabase, more or less altered to chloritic schist. Reticulated systems of small veins are also numerous. There are three zones or belts of mines—the Star of India group on the west, the Blair Con., Eclipse and Gold Hill on the central zone and the Smyth on the east.

One of the most prominent is the Gold Hill mine of the central zone, of what may be termed the western half of the gold belt. In this mine two pay zones have been developed in the amphibolite schist. The rock mass is much decayed at and near the surface and heavily mineralized with iron oxides. The zones are 10 to 30 feet in width and about 30 feet apart. The upper portion of the zone has been extensively exploited by the open-cut system and shallow workings, both shoots being worked by a single excavation. The facility with which ore could be mined here, and the large capacity of the mill—six tons to the stamp daily—made it an inexpensive proposition to operate.

Since writing a former paper of this series, in which the statement is made that the dolmitic material, with mariposite, is not seen in Calaveras county north of Carson hill, the writer has received information to the effect that this material is found in the mines of the Brown-Smyth-Ryland group of Smith's Flat. When these mines were visited formerly the dolmitic rock was not observed, as it was covered with detritus and overgrown with thick brush. This material is an important feature of the mines of the central belt in southern Calaveras county and in Tuolumne and Mariposa counties, but nowhere is it particularly indicative of value excepting at the Rawhide mine in Tuolumne county, where it was found phenomenally rich at one place. Gold occurs, however, in the dolmitic rock occasionally, as previously stated, but not abundantly, with the exception of the single instance noted.

The Extraction of Nickel From Its Ores.*

By PROF. ROBERTS-AUSTEN.

The Mond process marked an entirely new departure in metallurgical practice and in the principles which had hitherto guided it. It depended on the remarkable property possessed by nickel of forming a volatile compound with carbon monoxide, from which metallic nickel might be released if the gaseous compound was heated to 180° C. The methods hitherto employed for extracting the metal from its ores involved concentrating the nickel either as a sulphide (matte or regulus), or as arsenide (speiss), followed by either dry or wet treatment; and the metal to be refined, mainly with a veiw to separate it from associated carbon. In 1889, Dr. Ludwig Mond, in collaboration with Dr. Carl Langer, had been engaged upon a metod for eliminating the carbon monoxide from gases containing hydrogen. They had been guided by the observation that finely divided nickel removed carbon from carbon monoxide at a temperature of 350° C., converting it into carbon dioxide, whereas the dissociation of carbon monoxide by heat alone, according to Victor Meyer and Carl Langer, remained incomplete at the high temperature of 1690° C. The experiments were carried out in conjunction with Dr. Friedrich Quincke; finely divided nickel, formed by reducing nickel oxide at 350° C. by hydrogen, being treated with pure carbon monoxide in a glass tube at varying temperatures. The gas escaping from the apparatus was ignited, and while the tube containing the nickel was cooling, the flame became luminous, and increased in luminosity as the temperature sank below 100° C. Metallic spots were deposited on a cold plate of porcelain held in this luminous flame, and on heating the tube through which the gas was escaping a metallic mirror was obtained, while the luminosity of the flame disappeared. These metallic deposits were found to be pure nickel. Nickel-carbonyl was then isolated in a liquid state, and it was possible to produce it with facility in any desired quantity. It could be readily distilled without decomposition, but on being heated to 150° C., the vapor was completely dissociated, pure carbon monoxide being obtained and the nickel being deposited in a dense metallic film upon the sides of the vessel. No other metals which were submitted to investigation showed indications of combining directly with carbon monoxide except iron. The discovery that in a mixture of metals only nickel and iron would form volatile compounds with carbon monoxide, and that they could, therefore, be separated from other metals, induced Dr. Mond to arrange experiments with ores containing nickel, cobalt, iron, and copper —such as "kupfernickel" and "pyrrhotite." The experiments afforded such promising results that apparatus of considerable size, though still within the limits of the resources of a laboratory, was set up, and in it several pounds of ore could be treated with carbon monoxide. The principal nickel ores which were metallurgically treated contained the nickel in combination with arsenic and sulphur, besides other metals and gangue. These ores had first to be submitted to calcination, in order that the nickel might be present in the form of oxide, and to drive off, as far as practicable, the arsenic, sulphur, and other volatile bodies. The resulting oxide of nickel was treated with reducing gases, such as water gas or producer gas, in order to convert the oxide of nickel into finely-divided metallic nickel, and the material containing it was cooled to about 50° C., and was treated with carbon monoxide. In 1892 an experimental plant on a large scale had been erected at Smethwick, near Birmingham. The process began with "Bessemerized" matte; it ended with the market product, commercial nickel. The Bessemerized matte proceeded to the first operation of dead roasting, after which the matte contained 35% of nickel, 42% of copper, and about 2% of iron. It then passed to the second operation for the extraction of part of the copper (about two-fifths) by sulphuric acid, the copper being sold as crystallized sulphate of copper. The residue from this process contained about 51% of nickel, and it passed to the third operation for reducing the nickel. Incidentally, the remaining copper was reduced to the metallic state, care being taken to avoid reducing the iron. This was effected in a tower provided with shelves, over which mechanical rabbles passed, the reducing agent being the hydrogen contained in water gas. The temperature did not exceed 300° C., and should be kept lower when much iron was present. From this tower the ore was conveyed continuously to the fourth operation of volatilization, in which part of the nickel was taken off by carbon monoxide and formed the compound nickel-carbonyl. The formation of this volatile compound was effected in a tower, but the temperature was much lower, and did not exceed 100° C. From the volatilizer, the ore was returned to the reducer, and it continued to circulate between the reducing and the volatilizing stages for a period between seven days and fifteen days, until about 60% of the amount of nickel had been removed as nickel-carbonyl. The residue from this operation, amounting to about one-third of the original calcined matte, and not differing much from it in composition, was returned to the first operation and naturally followed the same course as before. The nickel-carbonyl produced in the fourth operation passed to a decomposer, which consisted either of a tower or a horizontal retort heated to a temperature of 180° C., so as to decompose the nickel-carbonyl and release the nickel in the metallic form, either on thin sheets of iron, or preferably, on granules of ordinary commercial nickel. Carbon monoxide was in turn also released, and was returned to the volatilizer for taking up a fresh charge of nickel. When the operation was in progress, the gaseous carbon monoxide and the partially reduced oxide of nickel and copper continuously revolved in two separate circuits, which joined and crossed each other in the volatilizer. The commercial product contained 99.8% of nickel. The author proceeded to a description of the working as he saw it in full operation in Smethwick. The plant had been working for some time, and nickel had already been extracted from different kinds of matte. The results were satisfactory, and pointed to the conclusion that the process was well able to compete with any other process in use for the production of metallic nickel. The process would always occupy a prominent position in chemical history, and there appeared to be no reason why it should not play an important part in metallurgical practice. Its application in Canada to the great nickeliferous district of Sudbury would probably contribute to the development of the resources of the Dominion.

Of Importance to Miners.

Superintendents of Government forest reserves in all the Western States and Territories where mining is carried on have received the following instructions from the Commissioner of the General Land Office, as to the cutting of timber on Government forest reserves:

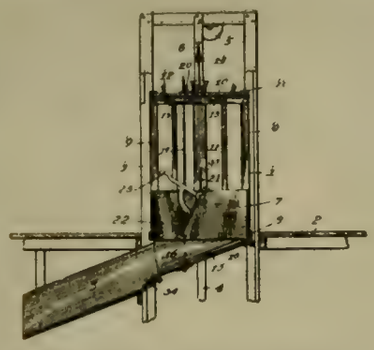
"Referring to the provisions of the Act of June 4, 1897, for the free use of timber, as regulated by paragraph 21, page 12 of rules and regulations governing forest reserves, you are advised as follows:

"Any person authorized by the said Act to secure forestry reserve timber for his own individual needs may procure it through a sawmill operator or other person acting as his agent direct; but however procurred, whether by his own hands or an agent direct, he should first confer or communicate with you directly, or through the nearest forestry officer, designating the location, amount and value of the timber proposed to be cut, the place where and the purpose for which the said timber will be used; stating what sawmill or other agent, if any, will be employed to do the cutting, removing and sawing, and pledging that no more shall be cut from the reservation than he needs for use on his own land or claim, and that none shall be sold, disposed of nor used on any other but his own land or claim; and guaranteeing to remove and safely dispose of all tops, brush and refuse cutting, beyond danger of fire therefrom.

"The bona fide settler and miner, each acting in his individual capacity, is not precluded from taking his timber to the sawmill; nor is the sawmill proprietor precluded from receiving or sawing or otherwise handling the timber for that settler or miner; provided the sum charged therefore is exclusive of any charge of the timber itself, and is no more than a reasonable sum to cover time and labor expended and all legitimate expenses incurred in sawing or handling it. The charge cannot be paid with any part of the timber, or with any other timber taken from any public lands.

"The stumpage valuation is the value of the timber in the standing tree, and it is determined by the locality and size of the timber, the commercial use for which such timber is sought, the demand therefor, etc.

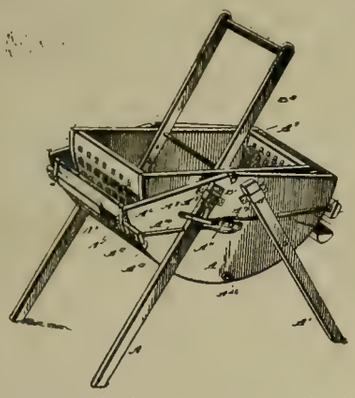
"The said provisions for the free use of timber contemplates individual use only. Therefore mining corporations, lumber companies and any organization engaged in extensive business enterprises requiring vast amounts of timber, are not entitled to any of the benefits thereof.



"Residents of towns and villages within or near a forest reservation, having railroad facilities and other convenient access to sawmills and lumber yards where lumber and fuel can be procured by purchase, are not entitled to the benefits of the provision of the law for the free use of timber."

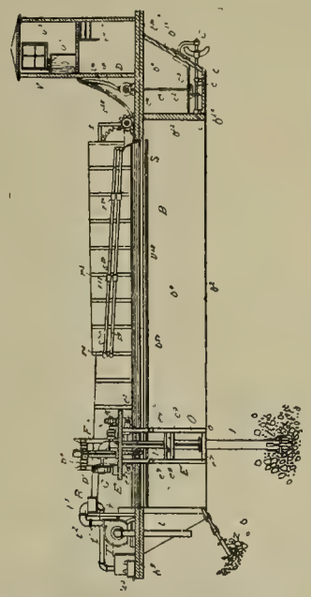
Latest Mining and Metallurgical Patents.

Patents Issued Aug. 1, 1899.



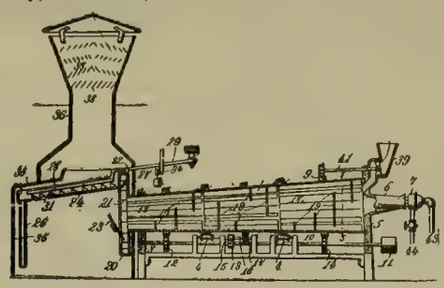
Specially Reported for the MINING AND SCIENTIFIC PRESS.

HOISTING CAGE FOR MINES.—No. 629,854; J. W. Hall, Coffeen, Ill.



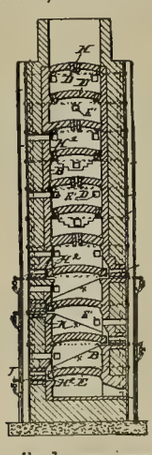
A hoisting cage for mines, constructed with a rectangular receptacle, a door hinged to close the entire lower end of the receptacle, which door is held closed by the weight of the cage, a door hinged to one end of the first mentioned door and closing half of the receptacle, and a vertically arranged partition in receptacle, the lower edge of which engages the edge of the second-mentioned door. Means whereby partition is swung laterally to disengage the edge of the second door, a framework in which the cage operates, and means whereby cage is held at a desired point in framework.

ORE WASHER.—No. 629,947; E. J. Beverstock, Washington, D. C.



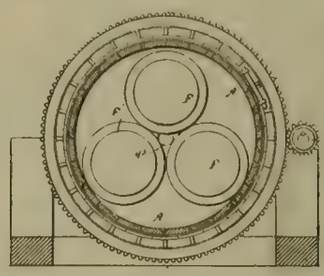
A machine of the class described, a pivotally suspended basket having a curved screening bottom in a combination with a stationary tank having an imperforate bottom of similar curvature, and having an open top and curved bottom with exterior transverse splasher bars thereon; the load carried by the basket is supported below its center of motion in combination with a tank having a similarly curved imperforate bottom.

SUBMARINE MINING AND ORE SEPARATING APPARATUS.—No. 629,910; E. C. Nichols, Topeka, Kans.



A submarine mining apparatus, a frame, a motor upon frame and a stationary material conveying hollow shaft supported within frame, a suction and force pump connected with shaft, shaft also having a separate telescopic portion, rotating power devices connected with the motor and telescopic portion of shaft, an elevating apparatus upon frame, also connected with the telescopic portion of shaft, and separate power reversing mechanism upon frame connected with shaft, elevating apparatus, and also connected with motor. A water carriage and a frame upon carriage, a suction and forcing apparatus and a conductor connected with the induction opening to apparatus and also with shaft, a motor upon water carriage, and a rotary shaft having a worm upon the frame carrying hollow shaft, a power conveyer connected with the shaft motor and the telescopic end portion of hollow shaft, and a collar upon telescopic portion of shaft engaging with worm, and means for reversing the action of motor. An oscillating frame, and a shaft with which frame is connected, suitably supported upon platform, and a hollow shaft adapted to be extended to the bed of the river, supported within frame, a suction and forcing apparatus upon platform, and a pipe having flexible joint connected with the induction opening to suction and forcing apparatus, and also with hollow shaft, and a frame upon platform, and a worm upon frame, and a curved rack upon oscillating frame.

ROTARY CYLINDER DRIER.—No. 630,059; C. M. Kemp, Baltimore, Md.



In a drier, a plurality of horizontal cylinder sections, mounted end to end to form a continuous cylinder, and means for rotating different sections in different directions. The combination with a drying cylinder having an open discharge end, of a drying table arranged at one end of cylinder so as to be heated by the exhaust heat from the latter, means for conveying the material onto the table after it has passed through the cylinder and a series of discharge tubes at the lower end of the table. A conveyer wheel secured to the end of the cylinder and serving to convey the material onto the drying table as it is discharged from the cylinder. A rake movable over the face of table and means operated by the cylinder for moving rake over the table. A cover plate at the rear of table and extending partly over the top thereof and a stack rising up from the table to convey away the exhaust heat from the drier. The drying cylinder having a series of longitudinal blades on the interior thereof, and a plurality of transverse deflector plates arranged in spiral order around the interior of the cylinder, plates being separated one from the other. A series of transverse slats located in the stack and arranged to arrest the flow of fine particles from the stack and to precipitate particles back upon the table.

ORE ROASTING AND CALCINING FURNACE.—No. 630,108; G. A. Richard, Mount Morgan, Queensland.

The herein described ore roasting and calcining device, comprising a vertically elongated structure, a furnace at the bottom thereof and horizontal partitions therein provided with openings at alternately opposite ends, some of partitions being provided with openings at the sides, and some of partitions being provided with vertical openings therethrough along the longitudinal center thereof. The structure provided with fireproof lining, horizontal partitions therein provided with openings at alternately opposite ends, the partitions being arched and some of them provided with openings in the top of the arches, and the others with openings at the sides of the arches, and injectors arranged at the side openings for directing jets of steam or air through openings into the chambers beneath the partitions in proximity to the openings at the sides of the partitions.

PULVERIZER.—No. 630,125; J. H. Steele, Butte, Mont.

A pulverizer, comprising a revolvable drum provided with inlet and outlet openings at opposite ends, and sets of plain disk-like crushing rollers in the drum, each set consisting of three rollers in peripheral contact with each other, and the sets of rollers being arranged side by side throughout the length of the drum with the two lowermost rollers of each set in contact with the drum, the spaces between the rollers of the several sets being in longitudinal alignment with each other and into which spaces the material is fed from inlet opening.

PROCESS OF EXTRACTING GOLD AND SILVER.—No. 629,905; John J. Hood, London, Eng.

A precipitant consisting of an alloy of about one hundred parts of zinc, five parts of antimony and twenty parts of mercury. The process of extracting the gold, silver and mercury from solutions, by bringing the solutions into contact with an alloy of zinc, antimony and mercury, from time to time distilling off mercury from the alloy, and finally recovering the gold and silver from it.

Copper Statistics.

The following table gives the semi-annual statistics of copper compiled by the New York Metal Exchange:

Supplies for the six months ending June 30, 1899:

	Tons.
Domestic production, as per producers' returns	124,487
Foreign net importation	13,908
Total supplies	138,395

Deliveries for the six months ending June 30, 1899:

	Tons.
Exports of domestic to Europe	51,723
Exports of domestic to British North America	220
Exports of domestic to Mexico	50

Contents of sulphate of copper exported:

	Tons.
7640 tons at 25%.	1,910
Total exports	53,903
Estimated deliveries for home consumption	72,000
Total deliveries	125,903

The domestic production shows an increase of exactly 4000 tons, as compared with the same period of 1898, but compared with the last half of 1898 the increase amounts to 10,702 tons.

The importation of foreign is the largest on record, exceeding even the total for the whole year of 1898 by 1000 tons. Of the 13,908 tons imported, about 7100 tons came from Europe, being mostly of Australian and Japanese origin.

Exports to Europe show a decrease of 13,611 tons, as compared with the same period of 1898, and of 14,180 tons if compared with the last six months of 1898.

The contents of sulphate exported show an increase of 820 tons as compared with the same period of 1898.

Deliveries for home consumption were extremely heavy during the second quarter of the year. For the six months the increase over the same period of 1898 amounts to 18,000 tons, and if compared with the second half of 1898 the increase shows 12,000 tons.

The surplus in supplies over deliveries amounted to 12,942 tons, the greater part of which went into newly established refineries.

The above figures are in long tons of 2240 pounds.

By a newly invented process, zinc sulphide is reduced to metallic zinc by first roasting the ore to convert the zinc into an oxide, converting the resulting sulphurous acid into sulphuric acid, causing the latter to act upon a chloride as cupric chloride or perchloride of iron, thereby extracting a portion of the lead removing such solution, roasting the mineral thus partly freed from lead, and then reacting thereon with hydrochloric acid gas in presence of water or a chloride solution, whereby lead and silver are first extracted from the crude ores and subsequently a final solution obtained containing the zinc in the form of chloride.

The Lucknow, N. S. W., Gold Field,*

By A. R. Canning, A. I. M. M.

Mineralogy.—The minerals found on this field are not numerous, but are interesting. They may be separated into two classes—payable and non-payable. Under the former are free gold, auriferous arsenical pyrites and antimony carrying gold. Under the latter are found magnetic pyrites (pyrrhotite), iron pyrites, zinc blende, and more rarely galena, stibnite, kersemite and cobalt bloom.

Free gold occurs in exceedingly rich patches in the calcite. When in this form it is most often dendritic in structure, but is also found tabular or threaded through the stone. Where the rock is less rich the gold differs but little from the ordinary reef gold, although usually met with in calcite. It is seldom found very massive, a 1 dwt. piece being considered large. Pieces of stone several pounds in weight have been and are still being found, yielding up to 40% bullion. Such stone on being treated with acid gives an excellent illustration of how the gold exists in the rock, for, the matrix being dissolved, the moss-like form of the gold is apparent. Rich stones of this class are not by any means regarded as office specimens, for they are not infrequent, and are treated with other ore going from fifty ounces and upwards. The output of the mine depends largely upon this special class of ore.

Up to four years ago, while oxidized zones were still met with, large cavities or vugs were found in the larger quartz veins. In these there existed a quantity of brown matter, sometimes of an earthy, sometimes of a spongy nature, and this carried as high as 50% of gold. By washing and squeezing the valuable contents were easily extracted. It was mainly to the finding of such pockets that the phenomenal returns of that time were attributable. There were 16,345 ounces in March and 16,965 ounces in April, 1895—at that time a record yield. Unfortunately, no specimens of this so-called brown vein have been kept. The value of the bullion is £3 10s an ounce.

Arsenical Pyrites.—This mineral is the most important, and, since the oxidized zone has been passed through, more gold exists in this pyrites than occurs in a free state. Arsenical pyrites is found both in radiating and massive form, though the latter by a play of light very often shows a divergent structure. These forms usually have from one-fourth to one inch radius, but portions of considerably larger bodies have been found.

Careful analysis to detect the presence of antimony sulphide, and so account for this radiating form, have failed to show that mineral. The arsenical pyrites assays very high in gold, the clean mineral in which no gold can be seen yielding 100 to 800 ounces per ton; and from other examples in which gold can be seen coating the faces, sticking out from or otherwise closely associated with the mispickel, assay results of 1500 to 3000 ounces to the ton have been obtained from lumps of considerable size.

Blocks of solid mispickel weighing from two to five tons have been found during the past three years, which, taken intact, would assay 250 ounces of bullion to the ton, and in some instances might have given better results but for the presence of pyrrhotite. For some time it was considered that the arsenical pyrites, in which the radiating structure was displayed, was richer than the more massive, but it is not so. Not the least interesting of the specimens shown is a fine-grained arsenical pyrites occurring in a clean, pearly lustered calcite in which the cleavage is well determined. Such stone, although not carrying more than 25% to 30% of mineral, assays from forty to fifty ounces of bullion per ton. A distinctly different class is found in a dense, fine-grained massive stone having an almost rectangular cleavage, but otherwise uninteresting in appearance. A portion of this stone assayed 321 ounces bullion.

Antimony.—This is more erratic in its occurrence than the other minerals, and, besides being auriferous, it almost invariably betokens the vicinity of rich arsenical pyrites. The value of the antimony lies entirely in the gold contents, and this varies somewhat. There may be said to be two classes of this mineral; the one is hard and untarnished and grouped in heavy well-defined crystals with striated faces. These crystals are found shot about in calcite. This form of antimony is not rich in gold. The other class shows a dense crystalline mass, the mineral being found in splashes or bunches. It does not appear to carry any quartz or calcite matrix. It is much softer than the first-mentioned, and, certain faces being tarnished black, it is evidently accompanied by stibnite. This class of mineral carries considerable gold, but varies with the locality in which it is found. It assays not less than 6 dwts. and more than 10 dwts. per unit of antimony. Bullion won from the antimony ores is good—far better than that obtained either in a free state or in combination with the arsenical pyrites. As has been remarked, antimony is a good indicator, and several valuable bunches of high-grade ore have been found by paying attention to a few specks or a tiny seam of antimony.

Non-payable Minerals.—Magnetic pyrites is the most prominent and the most unsatisfactory feature of the mine. Pyrrhotite occurs in zones in the veins, and either entirely replaces the auriferous mispickel or is so intimately associated with it as to almost smother it, bringing the value of the lode down till it verges on the unpayable. The magnetic pyrites seldom occurs massive, it being more often spotted about or displaying a reticulate form. Splendid pay bodies have gradually given place to this unwelcome mineral, which lives both in the quartz and in the calcite. Not unfrequently, after 50 or 100 feet of worthless pyrrohite, the arsenical pyrites reasserts itself. Where the magnetic pyrites is strong, great uncertainty exists as to whether certain blocks of ground will repay extraction and treatment. Frequently each sample contradicts the previous one. Carefully taken daily samples from a drive advancing along a strong lode, highly mineralized with pyrrhotite, gave the following sequence: 6 dwts., nil, 22 dwts., nil, nil, 3 dwts., nil, 12 dwts., nil, trace—results that hardly tend to elucidate matters. Where a strong calcite lode carrying pyrrhotite is found, it has to be subjected to very extensive prospecting in order to show whether parts of it may not prove payable. The pyrrhotite carries no nickel.

Iron pyrites and also zinc blende are found chiefly in the quartz reefs and apart from the gold-bearing calcite. This, however, is not a hard and fast rule, and free gold has been found on the field in conjunction with these minerals.

*Condensed from a paper read before the Institution of Mining and Metallurgy.

An Occurrence of Free-Milling Gold Veins in British Columbia.*

By Wm. Hamilton Merritt, F. G. S.

The free-milling gold ores have not as yet been developed to the same extent as the smelting ores in British Columbia. Indeed, it might very correctly be said that (excepting, possibly, the Poorman, near Nelson), until comparatively recently the Cariboo at Camp McKinney was the only mine that had been constantly at work for some years back on a free-milling gold ore of sufficiently high grade to yield its owners handsome dividends.

Somewhat similar conditions prevail about twenty-five miles from Camp McKinney in a locality known as the Fairview Camp, and while it cannot be said that developments up to the present have demonstrated ore shoots as extensive, and perhaps as high grade, as on the Cariboo, yet there is high-grade ore, there are strong and permanent veins, and I think I may very properly take a portion of this camp as a type of the occurrence of free-milling gold veins in British Columbia.

Intrusive granite appears to be the rock most intimately connected with the free-milling gold ores in the southern part of the province—that is to say, perhaps not of necessity as forming the walls of the veins, but, as in Nova Scotia, occurring in the immediate vicinity.

Here in one part of the camp in question an immense mass of intrusive granite forms the major part of a mountain. This is bounded on the northeast by a schistose quartzite (microscopic examination, referred to later, would allow it to be classified as a mica schist).

The schistosity of this rock is parallel to the edge of the granite. A couple of strong quartz veins occur in the schists running with them. The veins have been opened at various places along a length of a couple of miles and are found to follow in a general way, and sometimes to be quite close to, the edge of the granite.

Here and there protrusions of the granite mass have caused disturbances and have thrown the veins, in well defined faults, to the northeast. Where the faulting occurs the schist is also much twisted.

The veins above alluded to vary from 2½ to 12 and 15 feet in thickness, and so far as their width and permanency go they are everything that can be desired. The mineralization is similar to that of the Camp McKinney veins, consisting of varying proportions of iron pyrites, galena, zinc blende and gold.

A number of mill runs showed that the free-milling value was some five times that of the value of the concentrates obtained per ton of ore milled; but at the same time a considerable larger value, per ton of ore milled, escaped in the tailings caught by the Frue vanners; indeed, the loss in the tailings in some trials was nearly half the value of the bullion caught in the battery and on the plates.

In higher grade ore the tailings sometimes ran to $4 and $5 a ton.

The loss in the tailings is probably carried over by slimed concentrates. This is a matter that will bear careful watching in the development of the Fairview and Camp McKinney camps, and it would be no matter of surprise to me were it found that all the tailings run away from the Cariboo mill would bear treatment. Cyanide tests have given an extraction of 90% gold and 75% silver of both concentrates and tailings, the samples tested being from above mentioned test runs.

When running on a pay grade of ore the yield of concentrates is about 2% and their average value is about $70 a ton. They have been generally shipped to smelters.

As is usually the case elsewhere, the rich places appear to occur as shoots, and in the claim about 100 feet was quarried along the outcrop, yielding good results, from a width of over 12 feet in places.

I understand that the part of the vein which paid on the surface is being opened in depth.

It should be mentioned that while most of the veins have been developed in the schistose rock, yet there are cases where veins have been opened in the granite. In one of the latter instances ore was obtained which yielded upwards of $30 a ton in the mill, but it was reported that this vein was very irregular and all the pay ore mined out.

The geological features of the portion of the camp above alluded to is the more immediate object of these notes. It might appear that there were at least two series of upheavals—the first may have caused the fissures in which the veins were deposited, and the second, accompanied by constant great pressure, has produced the faults in the veins and also the schistosity parallel to the strike of the vein and at right angles to the evident thrust from the mountain of granite.

This is another example of the so-called "bedded vein" structure, but in this case they are as typical fissure veins as it is possible to imagine.

This is shown much more distinctly in another strong vein farther to the east. Here the vein occurs in a darker schist; but, on microscopic examination, its wall rock shows identical features to the wall rocks of the main system of veins beside the great granite mass. In this latter case, however, it is clearly shown in the rock section (described later on) that the original bedding has been disturbed by pressure and that the present bedding has been set up at some 50° from the original bedding, the present bedding being parallel to the vein.

An example such as this is of value to offset the too often indulged in deprecation of a vein where the bedding is parallel to it, and for which reason it is sometimes held that it is not a fissure vein, though indeed the bedding or schistosity may have been formed subsequently to the original fissure.

The following are the descriptions of the granite and schistose quartzite (or mica schist):

Biotite Granite.—Rock light in color, of medium grain and somewhat porphyritic, owing to the biotite being, as phenocrysts, scattered rather sparsely. The section shows granitic quartz with the usual inclusions; orthoclase rather fresh looking; plagioclase which is much altered and shows much secondary mica in small flakes all through it. The plagioclase is in excess of the orthoclase and the two are predominant in the rock. No accessory constituents are to be noticed in the section.

Muscovite Granite.—Resembles the above closely in color and general structure, but it is finer grained and is without porphyritic crystals of mica. The specimen was taken from the same intrusion as the above, but nearer the edge, where it has cooled more rapidly. The rock is more altered than the one just described. The microscope shows much muscovite, most of which seems to be derived from the feldspar. The little flakes show very high polarization colors; granitic quartz in normal proportion; feldspar present in large quantity, part of it seems to be orthoclase and part probably plagioclase, but very much altered, the muscovite being all around and through it. Some small scattered grains of ferric oxide, in the center of which pyrite is visible where decomposition has not yet oxidized the whole mass.

Mica Schist (*Schistose Quartzite*).—The specimen represents the general character of the formation in which the veins occur along the edge of the large granitic mass. The rock is a very fine and rather evenly grained mica schist. The quartz grains are rather irregular in size, but in a general way they are very minute. There is an abundance of both biotite and muscovite, the two kinds intimately mixed and forming pretty, continuous strings. Both are in fairly well defined crystals, the former in small, oblong prisms and the latter in long needles. Scattered quite profusely through the section are irregular pieces of pyrite, considerably decomposed, and with their longer axes also usually following the direction of schistosity.

Mica Schist.—This specimen represents the rock in which the vein to the east occurs. The constituents of this rock are identical with those of the last described, and they have probably both been formed together, but this rock is less evenly grained, as it shows evidence of having had another bedding previously, and the present bedding is naturally, therefore, not so perfect. The rock is stained dark with iron oxide and microscopically has the appearance of a fine-grained gneiss. It is seen to be made up of dark layers alternating somewhat roughly with lighter and thinner layers.

This section shows by the direction and arrangement of its mica constituents that there has been a previous bedding of the schist inclined to the present bedding at an angle of about 50°. The original schistosity may then have been parallel to that of the previously deposited specimen of mica schist, and the present bedding subsequently formed by heat and pressure at an angle.

*Condensed from Transactions Canadian Mining Institute.

Mining Summary.

ALASKA.

Reports received by the director of the Mint at Washington, D. C., show that so far this season the amount of gold received at Seattle from the Alaskan gold fields aggregates $4,900,000, of which $4,018,262 arrived during July. The amount so far received at San Francisco is approximately $2,700,000. These amounts, however, do not represent the entire output of the fields.

Juneau *Truth*: A new placer strike is reported on a creek flowing into Lake Bennett. Six miles of the creek is already staked and there is a rush to the new diggings. Mr. Morse of Skagway, who owns a quartz claim below the new diggings, saw coarse gold taken from one of the claims.

ARIZONA.

(Special Correspondence).—Stanley Butte and Mount Turnbull mining districts are on the San Carlos strip, on the west side of the Gila river, which was formerly part of the Indian reservation. The strip is from five to ten miles wide by forty-five miles long. It was thrown open for location as mineral land Nov. 19th, '98.

It had been known for years that a coal belt ran through the strip, from which, years ago, coal was mined and hauled by wagon to Globe and Phœnix. When the strip was thrown open the lands were formally located. It had been known that gold, silver, copper and lead existed here, but settlers were prohibited from developing the leads. A large portion of the district is mineralized, the predominating mineral being copper ore, which assays from 5% to 50% and carries gold from $2 to $100 per ton; silver from 5 to 50 ounces, and some lead. Some weeks ago it was reported that a body of wolframite had been found. Samples sent for analysis gave conflicting returns. In one instance returns showed tungsten to the value of $300 per ton; in the others no tungsten was found, but the samples contained gold and silver and a large percentage of specular and magnetic iron.

The formation of the district is lime, porphyry, quartzite and slate, and the veins are mostly contacts. No great depth has been reached in any place. Prospect holes 10 to 60 feet in depth abound.

Wood and water are here in sufficient quantities for present needs, and, in the future, timber in unlimited quantities can be obtained from the sawmills in the Graham mountains, while the Gila river, eight miles distant, will furnish water.

From Stanley Butte, which has an altitude of 11,000 feet, there diverge several ravines known as Kelly gulch, Squaw creek, Garden gulch, Deer creek, Hawk canyon, and others, on the sides of which are the various prospects.

W. J. Parks, who is interested in various parts of the district, owns interests in forty-two claims.

The Copper Belle group, owned by Jones & Porter; the Longfellow, owned by Bull, Whipple et al.; the Nevada, owned by Foster, Cunningham et al.; the Old Man and Palo Alto, owned by Allison Bros.; and the Black Diamond, owned by Dempsey & Williams, are among the important prospects.

The Lone Pine group, under bond for $22,500, is being developed under the management of John Belser, who is working three shifts.

The Gold Crack and Cabinet, owned by Cunningham, Knowles et al., has a shaft down 70 feet and has made two shipments of ore, the first netting $61 and the other $57 per ton. The Friend, owned by Warren & Blake, has made one shipment of sixteen tons, netting $150 per ton, and has another of a like amount ready for shipment. The Capt. Jack and Jump-Off-Joe, owned by W. C. Warren, is where the supposed tungsten was found.

The Grand Reef is owned and operated by John W. Mackay, and consists of a group of ten claims in Aravaipa canyon, at the foot of the Santa Teresa spur of the Graham mountains. This property was purchased by Mr. Mackay, December, '96, and has been operated continually since under the management of J. W. Payne. A depth of 700 feet has been reached and 3000 feet of levels have been run. It is stated that over $200,000 has been expended upon the property. Water is piped from wells three miles distant, and power drills used. Fifty men are employed at $3 to $4 per day. There are a dozen buildings connected with the property.

San Carlos Strip, Ariz., July 29th, '99.

(Special Correspondence).—Mining in Chloride district is active, made so by a number of rich strikes in old and, to some extent, abandoned mines, a number of which have been reopened within three months. Those that have been recently developed have in every instance become ore producers. The ore is found where work stopped years ago. It is proven that below water level the best ore is found. The ore in a number of instances is very rich in native and ruby silver, which is usually accompanied by gold, copper and lead.

The Tennessee mine has 12 feet of ore in its 375-foot shaft, chiefly lead carbonate, with streaks of wire and ruby silver through it. Recent rains have increased the water supply and the concentrator is now run most of the time. Within the past two weeks ore on the dump has been lessened and the concentrates shipped to Pueblo and Denver, Colo.

The Elkhart mine is also in ore and the concentrator is kept busy. The shaft is down 400 feet, with much crosscutting and drifting at this depth in ore. This and the Tennessee are on the same vein, separated by the Schuylkill mine. The ores in these mines are of the same character and value. The Elkhart is working a greater number of miners than ever before, and many improvements have been projected by Dr. T. B. Comstock, the Mgr.

Cleeland Bros. & Cochran of Philadelphia, owners of the Merrimac mine, have been here, and, after an inspection, decided to erect a concentrating plant. In the meantime, J. M. Russell is having preliminary work done at the mine, which has a quantity of high-grade ore on the dump.

Colin Timmons, Mgr. Payroll mine, has a large body of lead carbonates in that property. This is a branch from the Tennessee lead, being a few hundred yards southeast of the latter. It is of considerable size. This ore is being shipped, the mine having no concentrating plant, and no custom work is done in the district.

The Mollie Gibson mine, which was recently equipped with a steam hoisting plant, remains idle. Several men are working under the direction of Mr. Grant, the foreman, but the ore body is not being touched. The owners made the purchase last spring, and all are Montana men. E. J. Carter is Gen. Mgr.

The northern terminal of the Arizona & Utah R. R. is now near here.

Chloride, Ariz., Aug. 9th, '99.

Tucson reports that 100 men are at work in the Helvetia copper camp and that large smelters will be erected.

Pres. Coram of the Cochiti G. M. Co. has issued a circular outlining the developments at the mine to date. He says the company has a shoot of ore which is opened to 600 feet in depth, 450 feet in length and 60 feet in width—a block containing 1,500,000 tons. As soon as the mine is equipped to treat 10,000 tons per month it is thought it will be upon a dividend paying basis.

The village of White Hills, in Mojave county, was nearly washed away by a flood on the 3rd inst. Several cabins and other buildings were destroyed or damaged.

Kingman *Miner*: C. E. Sherman has opened a good body of ore in the Katie mine, at Mineral Park. The ore body was found in a drift run from the tunnel level and within a few feet of where leasers left off. It is 4 feet in width and all pay. A streak on the wall 20 inches wide gives a high value in silver. The mine has been idle for years.

Arizona *Republican*: A favorable report comes from Fool's Gulch. At the Planet-Saturn the 10-stamp mill has been started and five stamps are running. There is a scarcity of water, hardly enough for the five stamps. A portion of the water is pumped back to be reused. It is proposed to sink a new well of large diameter. The ore has been tested and proven satisfactory. The ore bins are full and enough rock is out to feed a 10-stamp mill three months.——R. McNary of Copper Basin is driving a tunnel in good ore. Six weeks ago twenty tons of this ore was worked at the Last Chance mill and turned out gold valued at $1056.54, while the concentrates carried $200 per ton.

Journal-Miner: The Empire M. Co. keeps its 10-stamp mill running day and night on Lynx creek, near Prescott. It is shipping a carload of concentrates every third day.

Journal-Miner: It is reported from Mayer that a strike has been made by the Standard Copper Co. Years ago a shaft was sunk 100 feet in a saddle of Copper mountain, and ore cut by the shaft extended from 42 feet below the surface to the 100-foot level, where the ore was 14 feet wide. It is a black sulphide of iron. Working tests of average sample lots returned from $20 to $26 gold per ton and several ounces of silver. The shaft was continued to a depth of 150 feet, being 550 feet lower than the apex of Copper mountain, and drifts were run in three directions to catch the ore body, but without success. Recently the old shaft was cleaned out and prospecting at a lower level recommenced. A mass of lime 40 feet wide was cut and in this 41 feet from the shaft Mr. Stoddard has struck the body of ore. The drift is in solid ore, which contains four times the copper values of the ore above, the black sulphide of iron being replaced by yellow sulphide of copper.

Kingman *Miner*: G. Klempf and W. Bohne have opened a body of ore on the old Mint claim at Layne Springs that runs 110 ounces silver and 2 ounces gold to the ton. This claim had long been abandoned.——Capt. Polhamus, with the new river steamer, is hauling two mills for the Arizona & New England M. Co. from Needles to the landings forty miles above. On the Nevada side of the river a 20-stamp mill will be erected and on the Arizona side ten stamps will be added to the ten stamps already in position, the two mines owned and operated by the company keeping the mills running.——A representative of the Standard Oil Co. has been examining mines of the Klondike district, in which that corporation is interested. The claims in which they have recently acquired an interest are large bodies of gold-bearing lime carbonate, in which shafts will be sunk.

CALIFORNIA.

Amador.

Sutter Creek *Record*: Supt. A. L. Gross has let a contract for sinking 200 feet in the Centennial shaft.——Development work is in progress at the Pocahontas mine and fourteen men are employed.——At the Bay State mine, four miles north of Plymouth, thirty men are employed and development is in progress. The property is owned in Stockton.——S. K. Thornton has a good prospect in the quartz claim he bonded on the Easton ranch.——The mills working on the old Pacific dump, which were closed recently, are running again.

Jackson *Republican*: Fifty men are employed at the Zeila mine and prospecting is carried on simultaneously with the regular work of the mine. The mill has recently been crushing ore from the Central Eureka. The Zeila mine has been working continuously for a quarter of a century.——At the Amador Queen No. 2, south of Jackson, drifting at the 500 level is in progress.——It is reported that work at the Amelia mine, adjoining the Argonaut, is to be resumed.——It is said that a mill will be put up at the Oneida mine next year.——Another rich body of ore has been found in the Central Eureka mine near Sutter Creek.——Devlin & Marsh, owners of the Klondike mine, have organized with a capitalization of $150,000 to work this mine.

Calaveras.

At the Petticoat mine, near Railroad Flat, a station has been cut at the 550 level; sinking to 650 feet and drifting on the 550 level are in progress.

At the Poorman mine, near Glencoe, the work of sinking from the 250 to the 350 level has been completed and a level is being run to tap the pay chute, which is 500 feet from the shaft.

J. Dixon and J. H. Lewis have discovered a large deposit of rich gravel in the Gunter mine at Washington ranch at a depth of 26 feet. The discovery is on the west end of the mine, where several shafts were sunk forty years ago, varying from 40 to 100 feet in depth, discovering a pot hole or depression in the ancient channel containing little gold on the bedrock, in consequence of which the diggings were abandoned. Dixon & Lewis found no gold on bedrock, but found a stratum of gravel above it 5 to 7 feet thick, which will yield $5 to $7 per ton.

Calaveras *Chronicle*: At the Vorlander mine near Middle Bar everything is running in good order. The new hoist is completed, the pipe laid and water turned on. The work of sinking the shaft will be continued. The lead has widened from 16 inches at 30 feet to 3 feet at the depth of 40 feet. The ore resembles that of the Gwin mine. C. M. Burleson of Mokelumne Hill is Supt.——J. D. Kline and J. A. Sterling are working on the Kline ranch, near West Point, sinking a shaft which is down 40 feet. They have taken out three tons of free-milling ore which will pay $40 per ton.——It is reported that the Farington G. M. Co. intends to sink the shaft on the Lone Star mine, near West Point, 500 feet and also to commence work on the Woodhouse mine, on the Middle Fork of the Mokelumne below Sandy gulch.

Amador *Ledger*: A bond held by J. F. Hamby, on the White Swan quartz mine, northeast of the Gwin, has been transferred to P. Deidesheimer and some Eastern capitalists. The mine is the property of A. J. Sargent.——G. Gates and S. H. Lucas, who are operating the Baltimore mine at Big Bar, are running the mill continuously on ore, which runs $6 per ton in free gold. There is little value in the sulphurets.

Angels *Echo*: Preparations are making at the Angels mine, at Angels, owned by J. V. Coleman, to begin operations. A new gallows frame, 50 feet in height, has been erected, and the concrete foundation for the engine and electrical motor is completed.——The boiler and other machinery recently delivered at the Harris mine, one mile south of Angels, is being placed in position. F. Dunlap is in charge.——It is reported that the Smadaeke mine, at Smith's Flat, will again start up.——C. Tryon has completed his contract to sink 200 feet of the shaft on the Bald Hill mine, at Albany Flat.——The addition to the Lightner mill is nearly completed and soon forty stamps will be dropping.——Recent discoveries in the Demarest mine, on the Copperopolis road, south of San Andreas, are very encouraging. The ledge is 10 feet in width.——Work continues on the Pioneer mine, in Smith's Flat. This is the property of the United Labor G. M. Co. The ore body is said to be 60 feet in width.

Jackson *Dispatch*: The Thorpe mine, near Fourth Crossing, has been shut down, it is reported, for an indefinite period.——D. Gutman has bonded the Ford Brothers' interest in the Ford mine at San Andreas for sixty days and a forfeit of $1000 has been deposited.

Angels *Echo*: The Utica Mining Company is having the ground south of the Stickle mill graded, on which a building will be erected for a large air compressor.——Sinking at the Gwin mine continues and the shaft has reached a depth of over 1600 feet. Last week all the rock taken out in sinking was run through the mill without sorting and it milled $5 a ton. As the shaft is 8 feet wide and the vein 2 feet, but a quarter of the rock milled was ore. A crosscut will be run west to the new vein at the 1200 level, and east below 1600 feet; crosscuts at each level to the main vein will intersect the new vein.

El Dorado.

Placerville *Democrat*: The Placerville Slate Quarry, one mile north of Placerville, operated by Col. Cummings & Son, has made its first shipment of slate. A carload of 47 squares were consigned to Keswick. The slate will be used in roofing the new buildings going up in that camp. J. W. Guthrie and W. S. Desborough of Sacramento recently visited the Pacific Gravel mine, in the Fair Play district. The object of their trip was stated to be to arrange for building a mill, with facilities for working the gravel in their claim. The mine is located on what is known as "Coyote Ridge Channel," and contains 60 acres.——The adjoining mine on the east containing 80 acres, known as the Umatilla, has been worked since February, when it was bonded for three months and afterward purchased by its present owners. Tunnels aggregating 1000 feet near the lines which divide it from the Pacific mine have shown the same gravel in both mines.——In the Pacific, besides the main tunnel 268 feet, there are crosscuts and drifts aggregating 419 feet, through which a body of gravel 30 by 90 feet, has been worked out. For milling purposes, water from a ditch 150 feet above the main tunnel and timber near at hand can be had at nominal cost.——The Blue Bird, near Soapweed, an early day producer, is to be worked under a lease, to a company composed of F. Morey, H. G. Sexton, A. Pierroz, H. Borden, W. Yeoman, E. Meier, H. Niedecker and W. McGarth, who have started operations.——A 2-stamp mill for testing purposes is to be erected by A. Demetre on his quartz claim above Georgetown. He has heretofore worked his ore in a hand mortar.

Georgetown *Gazette*: The 75-foot mark in the tunnel at the LeBoeuf-Weske mine was reached the first of the week.——The McKeeney mine, one mile north of Greenwood, will be ready to work when the mill is completed.——The steam pump for the Little Gem, near Volcanoville, is being taken to the mine.

Placerville *Nugget*: The Eureka Slate Co. has bought the Strahle slate quarry near Placerville. The company is capitalized for $500,000. A plant of new machinery will be put in at the quarry at Chili Bar. When the plant is installed 125 men will be employed.

Placerville *Republican*: There is considerable activity in mining in the vicinity of Kelsey, most of it being development work.——At Red Hill the Jermyn Bros. of Scranton, Pa., are driving a tunnel to crosscut the ledge. It is in 550 feet.——Hayward & Lane are sinking a shaft on the mine recently bonded by them. E. A. Davis is in charge. It will be called the St. Clair mine.——Callaghan Bros. have been at work a year with the cyanide process on the tailings from the mill on the St. Lawrence mine. They bought the tailings of A. Mierson, owner of the St. Lawrence.

Placerville *Nugget*: Fifty tons of rock from the Little Gem mine near Volcanoville is to be crushed at the Esperanza mill near Garden Valley. A new steam hoist and pump have been recently installed at this property and the work of sinking is progressing. Some high-grade ore has been taken out of the shaft.——H. Summers of Rescue reports that the Kepp Bros. have struck it rich at their pocket claim on Webber creek above the Boulder mine.

Kern.

Dennis Searles recently went to the Searles Borax Works to make a shipment of fifty tons.

De Reimer Bros. recently took to Los Angeles a $500 bar from the Merced mine, near Randsburg.

Randsburg *Miner*: The Annex mine is owned by Montgomery & Maginnes. At 130 feet a large body of good ore was struck some time ago. They have 100 tons on the dump which they will send to the mill. The vein is 3 to 5 feet wide.——In the Yellow Aster a new vein has been struck in the Hercules level, 900 feet below the point where the ledge reaches the surface. It is 60 feet in width, the same as in the Rand level. A small vein on one side is rich, showing coarse gold. The whole ledge is milled without sorting and yields $12 to $20 per ton. Two-thirds of the men employed in the mine are doing development work. Work was begun Tuesday on the foundation of the new hoisting plant. This will consist of a gasoline engine of 130 H. P., made by the Union Gas Engine Co. of San Francisco, and an auxiliary engine of 15 H. P. The new hoist is expected to be in place in a short time. The high price of fuel is one of the largest items of expense in working the Yellow Aster mines. Notwithstanding this the cost of mining and milling has been reduced to $3.12 per ton.

Los Angeles.

A gold-bearing gravel channel occurs on Mount San Antonio in Los Angeles county at an altitude of more than 8000 feet. The gulches tributary to the channel have been worked each summer, it is said, successfully for years.

Nevada.

Nevada City *Herald*: Rich ore has been found in the Reward mine, near Nevada City. The rock is rich in free gold and galena, and came from the bottom of the shaft, at a depth of 770 feet. The Reward is owned by a company consisting of R. C. Walrath, George Stone, ex-Postmaster Backus of San Francisco and others. The mine has so far paid over twenty dividends. The ledge averages ten inches in thickness.

Nevada City *Herald*: The Union Hill Consolidated M. Co. has incorporated: T. Mein, E. C. Creller, F. G. Beatty, S. Granger and J. H. Mooser. They will operate the Union Hill and other properties in Nevada county.——At the Pine Hill quartz mine in Wolf district, near Auburn, they have recently struck rich ore.

Orange.

Santa Ana *Standard*: The reports of the discovery of rich gold-bearing deposits in Lucas canyon, thirty-five miles southeast of Santa Ana, are said to be greatly overdrawn. Parties who have inspected the claims located there say that gold may be found in the canyon, but, owing to a scarcity of water, the work of development has been slow and results have been somewhat discouraging.

Placer.

The forty-four men at the Pioneer have progressed 1967 feet in the No. 4 tunnel south. Two hundred feet more will reach a point under the old workings, at which it is proposed to work upward with a view to reaching the region abandoned by the former management. The new tunnel is 600 feet below the level of the old workings.

Colfax *Sentinel*: Gillet & Taylor have completed their wing dam in the American river, near Colfax. The dam extends into the river and down stream below Rice's bridge 650 feet. They have commenced to move gravel.

Auburn *Argus*: Work on the Jupiter, at Iowa Hill, continues. The incline following the rim rock is well advanced. A preliminary or first cleanup was sent down recently. Eleven ounces of coarse gold was the result.

Riverside.

It is reported that the Santa Rosa rancho, on the mesa back of Temecula, has been sold to an English capitalist for $225,000. There are known to be mineral deposits and veins in that section but no mining is in progress.

Dry placer miners are working in the Virginia Dale country, using machines. The gulches on the south side of the range should contain placer gold. Several years ago, coarse gold to the amount of $1200 was taken from a claim called the Schillerman, from shallow surface workings. This gulch has never been

worked for placer. Other gulches near the old Rene camp on the south side should also be gold bearing, as the veins there are gold-bearing.

San Diego.

Los Angeles *Times*: The lepidolite deposits owned by N. G. Douglas are near Pala. A New York firm took a bond on the mines one year ago for $160,000, paying $10,000 down. This bond expires August 5th, and it is not known whether the bond will be taken up. The New York firm has done a good deal of work on the mines. One tunnel shows the ledge 40 feet wide at a depth of 50 feet. The cost of mining it is low. Several shipments have been made to New York. The cost of hauling it from the mine to the railroad at Temecula, Riverside county, is $4 a ton, at which place Mr. Douglas was paid $40 a ton for it, the New York parties paying freight on it from that point to New York. An analysis of some of the lepidolite from the Pala deposits showed that it contained 10% of lithia and 60% to 70% potash, the lithia being worth $700 per ton. Twenty-five men are employed.

Santa Barbara.

A lease from John Barrick and wife to J. C. Cody, J. C. French and H. S. Nelson to a small strip of land, containing three-fourths of an acre, lying south of and adjoining Miramar, for the purpose of boring for oil, has been recorded. The parties leasing the land will commence erecting derricks and boring for oil.

Shasta.

A report is current in Redding that the Mountain Copper Co. has struck a new ore body in depth in the Iron Mountain mine by prospecting with diamond drills. It is stated that the new strike lies 300 feet below the present workings. The Iron Mountain Co. has rewarded the men who worked so faithfully at the time of the fire several months ago and saved the smelter from destruction.

At the Oro Fino mine, recently bought by Behrens & Levisay, a rich body of high-grade sulphurets, accompanied by free gold quartz, is reported.

Shasta *Courier*: The Iler brothers, who own mines on Spring creek a few miles north of the town of Shasta, have sold their interest to W. G. Ducey of San Francisco, as the representative of Eastern men.

Redding *Free Press*: W. R. Beall, who has a bond on the Bullychoop mining property in western Shasta, is having the mine cleaned out.

Sierra.

Sierra Valley *Record*: H. and J. Goering, who are mining near Haskell's Peak, after a run of a month, were compelled to shut down on account of the short water. During that time they cleaned up $2000. The gold runs over $19 to the ounce. This fall they will run 150 feet of tunnel to tap the channel. They have been working on the rim.

Downieville *Messenger*: Last week another rich body of ore was struck in York & Sons' mine in Slug canyon.

Nevada City *Transcript*: Captain Nihell and his men are making good headway with the new 20-stamp mill at the Alaska mine of Pike City. They have removed the old machinery that passed through the fire a few years ago and find that a portion can be used. Thirty-one men are working on the claim besides the builders, and the developments are satisfactory.

Nevada City *Herald*: It is reported that a rich strike was made a few days ago in Harper's mine, at Forest City.

Siskiyou.

Yreka *News*: Jillson, Roberts & Co. continue paying dividends. Miner & LeFlesh of the Badger State M. Co. put in $15,000 before realizing a dollar. Monday they struck the ledge in the lower tunnel.——Doney Bros. have two good prospects, one of which they have developed. It shows 4 feet of ore at 100 feet, some of it worth $50 per ton.——J. L. Boyle has a 4-foot ledge of $10 rock, which was found in searching for a rich stringer lost two weeks ago. Before losing the stringer he took out twenty-four tons of ore, twelve tons of which was milled in the Ashland mill by J. Kinney and C. Lindsey, the brick weighing $824.75. Two tons milled by F. Hegler returned $140. Ten tons sent to the Mountain Copper Co. at Keswick netted $60 per ton.——The Union Copper Co., near Low Divide, shipped ten tons of copper ore from their mine last week, which netted them $255.70.——The New York Copper Co., at Youngs valley, have employed thirty men.——A new discovery has been made at the headwaters of Elliott and Joe creeks by L. F. and A. Cooper and W. Malone of Crescent City. They report that the vein has a width of 25 feet, and assays show copper and gold.——Hendricks & Thompson, owners of the claim bearing their name, twenty-five miles northwest of Klamathon, report the shaft down 150 feet, the vein 8 feet wide and carrying excellent values.

Yreka *Journal*: The Sheba mine at Patterson creek is to have air compressors to work drills on the lower level, where the ledge is firmer. The upper works seemed to be in a succession of ledges, loose in places. The mill is running day and night.——The Wheeler M. Co., working at the Nehrbass place on Greenhorn, adjoining the Blue Gravel mine, is near bedrock and has had to cut through boulders and handle a large amount of water. The two pumps in use are kept running constantly and raise water enough to more than supply Yreka.——The Greenhorn Blue Gravel mine is working a smaller force, owing to a failing water supply.

Trinity.

Weaverville *Journal*: R. A. Skinner has struck a ledge of rock in the Yellowstone mine, owned by him, in East Fork mining district. He has been running for the ledge for some time. The mine was formerly owned by W. T. Coleman and was a good bullion producer in the past.——This week the sale of the group of mines in the Arkansas Dam mining district, above Junction City, owned by T. F. & C. E. Bergin & J. C. O'Neil, was made to the Maple Creek M. Co. of San Francisco for $35,000.——In the New River country J. Frank is prospecting for D. M. Burns and M. Gunst of San Francisco.——The roasting plant at Harrison gulch is nearly completed.——At the Chloride-Bailey mine, near Junction City, they are working twenty men. At the Globe, over the hill, men are at work.——At the Red Hill placer property, under Supt. Goodyear, they are preparing for a cleanup. Thirty-six men are working.

Redding *Democrat*: The Boulder mine is on the west slope of the divide between Sacramento river and the east fork of Trinity river, and 5 miles from the Altoona quicksilver mine. Three years ago G. L. Carr bought the property and has expended several thousand dollars in development. He has run 1500 feet of tunnel trying to find the vein from which came large quartz boulders rich in free gold. Eastern men have been interested and G. C. Carson, M. E., will superintend future work.

Tuolumne.

Sonora *Independent*: United Star Quartz G. M. Co., Stent; capital stock $250,000; T. F. Gormley, A. W. Gilfillan, Quartz Mountain; F. Simen, Sonora; J. P. Mangante, Jamestown; D. Russell, Stent.——Esperanza G. M. Co., San Francisco; capital stock, $200,000; W. A. Clark, Berkeley; S. Salomon, R. Stevenson, San Francisco; J. Y. Miller, East Oakland; F. Enzensperger, Sonora.——Temescal G. M. Co., San Francisco; capital stock $1,000,000; C. B. Tilley, J. E. Stock, J. F. Holling, H. W. Gray, San Francisco; F. McPherson, Sonora.——Mountain Spring M. Co., San Francisco; capital stock, $100,000; H. L. Eastman, Alameda; E. J. Ensign, J. H. Duncan, W. W. De Lano, F. M. De Lano, San Francisco.——Black Oak South Extension M. Co., San Francisco; capital stock, $100,000; W. E. Miles, R. S. Moore, Oakland; D. J. Staples, J. Mason, San Francisco; J. J. Mason, Berkeley.

COLORADO.

The Colorado Fuel & Iron Co. of Pueblo has a contract for a six months' supply of coke for the smelter of the Copper King of Arizona, at Barrett, Ariz.

The Denver Smeltermen's Union has voted almost unanimously to continue its strike until the American Smelting & Refining Co. shall agree to pay the wages awarded by the State Board of Arbitration. The two smelters in Pueblo and two in Denver owned by the association are closed.

The Denver Smelting & Mining Co. was incorporated on the 9th inst., with a capital stock of $1,000,000.

BOULDER COUNTY.

L. H. Denison, Supt. of the Slide mine, at Gold Hill, who leased and bonded the Nugget mine at Rowena, is taking out $600 to $1000 per day. The ore is a decomposed iron, easily worked, and the greater percentage of the values is caught on the plates. The ore carries $40 in gold, and with a few men from fifteen to twenty-five tons is broken down daily.

The Inter Ocean, located in the town of Sunshine, is working steadily with eighteen men and shipping sixty tons per month of high-grade ore, some of which runs six ounces. The shaft is down 300 feet on a 6-foot vein of tellurium ore, with a pay streak 1 foot in width. The rich ore occurs in thin streaks through the mass. The ore is treated as it comes, averaging $80 per ton. Sinking on the ore body has been resumed.

The White Crow mine, near Sunshine, is making preparations to resume operations. The shaft is down 500 feet on a vein 5 feet wide, with a pay streak of 6 inches that will run seven to eight ounces.

The American Star is the mine that was jumped by E. H. De Vore a year and a half ago, who claimed that the assessment work for 1897 had not been done and that the buildings were on Government ground. The ore is silver and rich. A body of ore has been opened in the property averaging 4 feet in width. The shaft is 260 feet from the tunnel level and 350 feet from the surface; it is in ore all the way. Until recently twenty men have been employed, but the former owners of the property have been enjoined by Mr. De Vore from taking out any ore, pending the litigation, and the mine is closed.

The Cold Spring M. & T. Co., at Gold Hill, is driving a crosscut tunnel to cut eleven claims, owned by the company, and make a connection with the shaft, located half a mile northeast from the town. It is in 460 feet, and is to be equipped with a compressor, the foundation for which has already been built. The Cold Spring Co. is composed of Jerseyville, Ind., men, who have been fortunate in a lease on the Mary McKinney, at Cripple Creek. A tunnel was a necessity, for the company, upon the completion of the tunnel, will construct a mill.

CHAFFEE COUNTY.

Victor *Record*: Within less than a mile of Buena Vista, on Free Gold hill, there has been made a strike of gold ore. The Single Standard G. M. & M. Co. started a new shaft recently on a showing that assayed $4.50 at the surface, but on reaching a depth of 200 feet they encountered a body of sulphide ore which runs $150 in gold to the ton. The strike was made on what is known as the Hendricks claim of the Cleveland group of three claims.

CLEAR CREEK COUNTY.

Denver *Republican*: C. Barron reports new gold discoveries on Chicago creek and says that he has one of the rich veins. There are a great number of prospectors in that locality. Many veins and porphyry dykes pass through near the north and south branches of Chicago creek. It is this part of the district which has received the name of Ozone. J. F. Bridges reports finding rich gold-bearing float. He says the veins are wide and rich in free gold. Where some of the richest float is found the slide is many feet deep and the veins are found by trenching. It is reported that phonolite and tellurium have been found. The belt is two miles wide and discoveries have been made along it a distance of five miles.

(Special Correspondence).—The property known as the Tuller & Riley group, south of town, has been sold to an Eastern company, who take charge of it to-day. It was sold for $50,000, part of which has been paid. The first car of ore has been shipped by the old owners, who reserved the ore on the dump, and this first shipment of 9¾ tons netted them a little over $3000. The purchasers expect to sink a shaft as rapidly as possible and drive a tunnel that will tap it at 150 feet, to determine the values of the quartzite dyke in which the vein lies. The high-grade ore is in a vein of white quartz and is 8 to 18 inches thick; it has been opened 3000 feet. Along it at different places and at every opening free gold is visible. The ore has a small amount of iron associated with it, with some copper, a little lead and a good deal of tellurium. This narrow vein lies in a large reef of a changed quartzite, 200 feet wide, and which cuts the dark schist at nearly right angles. It is hard on the surface, but a few feet down it is soft and slightly stained with iron oxide. It disintegrates soon after exposure to the air, leaving a fine granulated mass of crystals. The dyke is interlaced with narrow, ribbon-like veins of white quartz. The gold is sometimes found in the pure quartzite. They have good water power 300 yards down the hill, where a tunnel and mill site can be had.

The concentration mill for the Keystone mine, near Crested Butte, owned by Smith, Bartholemew & Miller, is about ready to make a trial run, and ore is now being hauled from the mine to the mill, which is to be run by water power from a Pelton wheel hired from the Crested Butte Light & Power Co. The mill will have a daily capacity of about fifteen to twenty tons, owing somewhat to the number of hours run. The ores are a low-grade lead and silver, with some copper and a little gold. It will run about three to six tons to one. The finished product will be worth from $15 to $20 per ton net. Great things are hoped for the mill, as there is a good deal of similar ore near there. If the present mill is found satisfactory, a new one will be built next spring at the mine, with a greatly enlarged capacity, which it is hoped the present operations will bear out.

At the Standard mine the shaft is down 75 feet. It is one of the claims owned by the Underhill M. Co., in which Gov. Adams & Bro. own the controlling interest.

The work of placing machinery on the Tom Boy is being rushed and sinking will be commenced. It is the intention of the company to put it down to 400 or 500 feet before drifting is done. The vein is wide and is soft, yellow carbonate on the surface, which at 20 feet has grown hard and shows a fine-grained, pink quartz. The vein is 30 feet wide and lies between schist walls. The surface values show $13 per ton across 8 feet, as far as it has been cut. There is another vein of the same nature, a third of a mile south, that parallels it. It has schist on one wall and coarse porphyry on the hanging wall. This mine is on the Grand Central group, owned by Bartholemew and others.

Work on the Du Boise tunnel is going along and also on the vein at the surface called the Pride of Denver. A recent mill run from the vein gave returns of $10 per ton free gold.

J. McCormick has made a strike in his property at Tin Cup of manganese, almost solid ore, but shows plenty of free gold.

C. Johnson of Denver is securing property at Tin Cup for a company.

The last of the Union Park machinery has been hauled to the ground. The machinery for a steam stamp mill has been taken to the same vicinity by another company.

At the Bull Domingo, on Italian mountain, a great deal of high-grade lead ore is being taken out, which will have to be packed out. The management finds trouble in securing a sufficient number of animals.

At the Gunnison mine the shaft is being sunk and no other work is going on.

At the Good Hope a contract has been let to sink the shaft another 100 feet, which will give it a total depth of 400 feet. The shaft is in the best ore found in the mine, which will run $5 per ton.

At the Humboldt, on the west, it is reported that the ownership of the mine has passed into the hands of the principal owners of the Venable Co. and is now operated by the latter company. The Humboldt Co. have a bond on the claim by that name and the new management assumes the bond.

The Vulcan mine is again sending out regular shipments, the strike trouble having been settled. It is under a new Supt. and things are going along smoothly.

Gunnison, Aug. 5th, '99.

GUNNISON COUNTY.

(Special Correspondence).—In Crystal district a number of new prospects have been opened this season. The Fargo, owned by the Crystal River M. Co., has a vein which carries copper with lead and silver. In 6 feet the pay streak has widened from 14 inches to 36 inches. A pack train is hauling this ore to the Marble smelter. The Black Queen ore taken out last fall after the road closed has also been packed down.

The Carbonate, on Crystal mountain, is making steady shipments to the smelter.

The Copper King, above the Lead King mine, has ore out that will run 10% to 80% copper, with silver.

The Mineral Point M. Co., has let another contract on the Laura.

The Attix properties in Paradise Gulch have several tons of ore for shipment.

The concentrator at Scofield, under the management of Cramer & Co., is equipped with three tables and is nearly completed.

The Bent, on Mineral Point, has an ore chute opened 185 feet and its further extent is not known. It carries copper, gold, silver and lead.

The North Pole in Crystal Basin is producing carbonate of copper which will be hauled to the railroad.

Crystal, Aug. 8th, '99.

HINSDALE COUNTY.

Lake City *Times*: Mgr. Farrell of the Lellie has let a contract for 50 feet more on the long tunnel to Senter & Hardy.——The Silver Lake, Iowa and Sunnyside mines in San Juan county are resuming operations and men are said to be scarce.——Returns for the last carload shipment from the Big Horn mine received by J. S. Hough ran 175 ounces to the ton in silver.——Hill & Griffiths, leasers of the Wyoming mine on Copper mountain, have reduced the force on the mine, not being able to get their ore treated by the smelters.——W. Morehead, owner and operator of the John A. Logan property, above Capitol City, reports that he will have a carload of lead ore to ship from there in a short time.——Some time ago the Contention vein was cut in the Argus tunnel and work is being done on the vein. They lack 80 feet of being under the ore shoot from which high-grade ore was taken in the upper workings.

LAKE COUNTY.

One of the most important strikes in the Twin Lakes section has been made on the Rhoff group, owned by McDonald & Dewar. The vein is 6 feet wide, with a 2-foot pay streak. A 55-pound sample gave an average value of $55 gold and 6% copper. High-grade ore has been found in the breast of the 240-foot tunnel on the Ruby, an adjoining property.

In the Lecompton shaft of the Nisi Prius group on Rod hill, Leadville, a 3-foot vein has been cut which carries seventy-eight ounces silver, 18% lead and .04 of an ounce gold per ton.

The Leadville Home M. Co. is shipping iron from the Penrose and will soon start shipments from the Coronado.

A shipment of thirty tons has been made from the new discovery in the Lillian mine, on Printer Boy Hill, near Leadville, running 30% copper, seven ounces silver and $4 in gold.

Leadville *Reporter*: Another mill will soon be running in Leadville which will have a capacity of 75 tons per day. It is the cyanide mill in California gulch. The mill was built by the Ibex company some time ago for the purpose to work its low-grade ores, but did not prove satisfactory. The company has been storing ores of a grade of less value than they have been shipping with the intention of milling it, and in the last two years have piled up a large amount of it.

TELLER COUNTY.

Returns to the Jack Pot mine of Cripple Creek from the last four shipments sent from the Creston lease were 5.34 ounces, 3.55 ounces, 9.9 ounces and 4.6 ounces. These four shipments, after freight and mill charges were deducted, netted $10,700. In the bottom of the winze, below the 400-foot level, there are 2½ feet of ore that runs $30 to $40 per ton.

J. Winchester, lessee of the Doctor mine at Victor, has made claim to a large portion of the rich Jack Pot ground, alleging that the Jack Pot vein apexes in the Doctor ground. The workings of the two mines are now separated by only a few feet of unbroken ground.

Simmons & Mick the 1st of August commenced work on the Flat Top on Copper mountain. The claim adjoins the Fluorine.

Victor *Record*: It has been decided to equip the Union mine with air drills, the air to be obtained from the Smith-Moffat plant at Goldfield. These drills will aid in the development of the find made in the Orpha May claim recently.——Gold Hill will add to its list of shippers the Happy Day claim of the Alamo M. Co. Silas Parker, the lessee, is erecting an ore house. Drifting at a depth of 80 feet, 20 inches of mineral has been found which assays as high as $1200 to the ton. The entire 20 inches will ship $50 to the ton.——Since the Matoa G. M. Co. commenced operations on its own account, twenty to thirty tons of ore weekly have been marketed, averaging two ounces to the ton. One hundred tons or more are broken in the mine. The property is being developed and prospected. Contractors are working on a 220-foot sinking contract which will put the shaft down to 810 feet.——The Whipp and Glenn lease on the Lansing, of the Pinnacle Co., is shipping a carload of ore daily. Inside of thirty days the mine will be producing from fifty to seventy-five tons every twenty-four hours. The workings are full of ore and in the stope between the second and third levels the miners are breaking 9 feet of ore. In the south drift from the bottom level the breast shows 4 feet of ore and the walls carry values for some distance back. The ore broken in this drift assays $40 to $340 a ton.——Melber & Geraghty, leasing on the Mitchell of the same company, have ten to twelve tons of ore out.——The Lloyd lease, on Pinnacle ground, is also reported to be in ore, a vein having been cut at a depth of 45 feet, carrying values of one ounce to the ton.

Victor *Record*: At a depth of 85 feet in the new shaft being sunk by lessees on the J. I. C., on Battle mountain, one of the largest ore bodies in camp has been encountered. It has been crosscut for 13 feet, with but one wall in sight. The values range between $8 and $15 to the ton. The J. I. C. is owned by the Republic Company.

Victor *Record*: Walker & McGovney, leasing on the joint shaft of the Specimen, have sent out a shipment of ten tons of screenings, which will run twenty to thirty ounces to the ton, and fifteen tons of coarse rock, estimated at ten-ounce ore. These lessees have opened in the fifth and sixth levels, at depths of 250 and 300 feet respectively, the rich lead first uncovered in the 200 level. A crosscut is being driven in the third level. The vein lies 80 feet south of the shaft and is new to the property. The rich seam is 1 to 4 inches in

width.——The Annie, on Gold hill, has been leased by the owners, Tutt & Penrose, to H. L. Brown, F. Cole and W. H. H. Hamilton, for one year, with an option of six months extension; royalties graded. The property is developed by a shaft 140 feet deep and has produced considerable ore.

Denver *Republican*: A strike has been made on the Monument, on Battle mountain, at Victor. The block under lease to Parcells, Limbach & Welch is in good ore. At a depth of 40 feet the lessees have a body of sylvanite ore, a streak in which runs as high as fifty ounces to the ton. Parcells & Co. have leased on this ground for two years, dating July 1, paying a royalty of 30%. They commenced by prospecting the surface, and succeeded in opening a promising vein in three surface trenches. The vein varied in width from 6 to 18 inches, and assays from one to twenty ounces were had. A shipment of six and a half tons was settled for at 127 ounces to the ton. The lessees have been sinking a shaft east of the vein. At a depth of 40 feet a crosscut was started which struck the ore found at the surface. The lessees also have a lease on a block of the adjoining Dillon claim. This lease is for one year, and the same royalty is to be paid. The rich find has been found on this ground as well.——It is reported that the lessees of the Burns of the Acacia Co. have broken into richer ore. Curll & McGill, the lessees, opened up 3 feet of smelting-grade ore in a winze sunk from the 500 level. Several shipments were made and further development resulted in finding rich mineral. One ton is estimated to return $1 to the pound.——The gross value of the output of the Jack Pot mine, on Raven hill, for July is estimated at $80,000. Returns gave from 76-100 ounces to 8.56 ounces to the ton. High grade is being saved.——The Doctor mine, on Raven hill, owned by Cone & Robinson of Canyon City, has been leased to J. Winchester of Denver, who has in turn subleased the ground to other parties.

IDAHO.

Reports from the Badger Creek gold district, near Boise City, vary as usual in such cases. The original discovery, the Copper Queen claim, has been developed to show 10 feet of ore. High assays have been secured, but the average value is from $25 to $50 a ton.

The De Lamar mines of Idaho, during the first eight years' management of the new company, produced 292,591 tons of ore, which yielded $6,323,000, of which $4,850,000 was paid out in dividends, being 117½% of the original capital invested and leaving $170,000 in the reserve fund. The expenses of operation for the same period were $3,970,000.

Spokesman *Review*: A peculiar vein has been found in the Black Jack mine in the Hump country. From information that has come to Dr. Miller of the Idaho University, this vein has a banded structure, having 16 inches of quartz and 16 inches of porphyry, in alternating bands. The quartz carries no values and where the porphyry joins the quartz, the porphyry, on either side, carries iron pyrites from the width of one to one and a half inches, which streak carries $40 to $1600 to the ton in gold. Between these streaks the porphyry is also barren. What the miners call porphyry in this mine is pronounced by Dr. Miller to be a serpentine carrying iron pyrites.—— Since snow has disappeared from Buffalo and active development begun the camp has been improving. All trails into the Hump are bad and travel slow. There is much fallen timber, and the trails are badly defined and in many places dangerous. There are two towns; Buffalo is at the Big Buffalo mine. The other town, where the postoffice is, has been located two miles from the mine.——Owing to litigation the Big Buffalo, which was bonded to the De Lamar company, has reverted to the owners. It is said Mr. Huntley, for Capt. De Lamar, sampled the Big Buffalo lead across the surface cropping and obtained an assay of $19.78; 63 assays averaged $15 in gold. Three samples of the Oro Fino, one of the claims of the group, showed an average of $196.——The San Francisco at Buffalo is under bond for $85,000 to an English corporation.——The St. Louis, which is under bond to Norman & Cameron for $20,000, has been given up and a new bond was taken upon the claim by W. H. and F. E. Young of Spokane for $85,000, on which $5000 was paid. The lead on the St. Louis has been recently crosscut in six places, showing an average width of 20 feet. The ore is yellow decomposed quartz.——On the Fortune, the property of the Norman & Cameron syndicate, work is in progress. The company is erecting buildings. A cut has been run showing the vein 7 feet wide, with an average value of $20 per ton in gold. The croppings show 20 to 30 feet wide.——The Monte Cristo has been crosscut in several places, showing a vein 6 feet in width. The El Dorado adjoins the Monte Cristo. A tunnel is being run on the line between the two claims to cut the lead 200 feet deep.——Work is to be started by C. Sweeny and W. B. Heyburn of Spokane on a tunnel to be run into Buffalo Hump mountain, which will crosscut all the leads.

Idaho *World*: The shaft on the Wolverine mine at Banner has caved and five pumps, three cages, tools and iron pipe are in the wreck, besides other valuables, worth in the aggregate $5000. The shaft was covered with heavy plank at the 200 level. Whether the cave has gone below that level is not known.

MICHIGAN.

The annual meeting of the Calumet & Hecla Copper Co. will be held on the 16th inst. President Agassiz says: "During the past year we produced mineral equal to 43,879 tons of copper; product in fine copper was 44,450 tons. For the previous year our refined copper product was 45,194 tons. The price of copper has varied from 12 cents to 18⅛ cents per pound. It is now 18⅛ cents. During the past fiscal year there have been paid three dividends of $10 each and one of $40, including $30 from surplus cash. In this connection it may be interesting to compare the work we were doing in 1874 with the amount of work performed in 1899. Twenty-five years ago we were hoisting 800 tons a day from an average depth of 800 feet along the slope of our shafts, equal to 400,000 tons raised 1 foot high. The average per day in April, 1899, was 5206 tons raised 3800 feet along the slope, equivalent to 12,302,250 tons raised 1 foot high, or thirty times as much work done in 1899 as in 1874. In 1874 we employed 1616 men. In 1899 we employed 4706 men. The comparative cost of this work was as 30 is to 9."

The lode below the forty-sixth level, No. 12 shaft, South Hecla branch of the Calumet & Hecla mine, shows the richest copper ground ever opened in the mine. Much of the rock is shipped direct to the smelter, being too rich for stamping, ranging from 50% to 80% pure metal.

In No. 5 Calumet and in Tamarack Jr. branch of the Osceola Con. considerable ground giving 20% copper has been mined the past three years.

The first rock from the Arcadian mine has been sent to the stamp mill. New machinery at the mine and mill runs smoothly.

The second drill exploration located Trimountain lode, this time at a depth of 100 feet on incline of vein. Fourteen feet of cores were taken out and some show as good copper as that secured at Copper range, on which Trimountain lode is also opened on the west.

The Mesnard shaft on Quincy property is unwatered and is being straightened and enlarged to the bottom, a depth of 180 feet.

The Kearsarge lode has been located on the Eagle Harbor property.

MISSOURI.

In the Missouri zinc field none of the mines are down below 200 feet and the ore goes down to a depth of 1000 feet. The Crossman Drilling Co.'s charts show the best ore between 300 and 400 feet. In this region the ore underlies an area twenty-five by forty miles, and ore is found at various depths. One double compartment shaft and five other shafts are being sunk on the Chitwood properties, owned by the United Zinc & Lead Co., and a new 100-ton mill is under contract to be built. The company is operating by the royalty system of mining, as this has been found the best way of working the properties.

The New York Zinc Co., with a capital of $700,000, has been organized under the laws of Delaware to acquire a large zinc property in the Missouri-Kansas zinc and lead district that produced the past twelve months 44,377,630 pounds of zinc ore and 1,147,200 pounds of lead ore that was sold for $229,151.

MONTANA.

The Anaconda Copper M. Co. has acquired a quarter interest in the Parnell mine from T. Driscoll for $15,000. The Parnell is being operated by the Montana Ore Purchasing Co. It is said to be showing up well. It is directly north of the Mountain View.

J. A. Murray has transferred to P. T. Dudley of New York three-eighths interest in the Blackfoot for $15,000. S. F. King also conveys to Dudley one-eighth interest in the Blackfoot.

It is reported that the Amalgamated Copper Company has bought the Speculator mine at Butte, which has a capacity of 300 tons of ore a day.

A mining company under the name of the Smoke House Copper M. Co. has been organized for the purpose of tunneling under the city of Butte for copper ore. The organization of the company was brought about through a settlement of litigation which has been going on for years, involving the Smoke House, Destroying Angel and Copper Bottom mining claims, which cover the principal parts of the city of Butte. J. A. Murray, the banker, and other capitalists are at the head of the company.

Salt Lake *Tribune*: T. W. Buzzo, general superintendent of the Alice Mining company's property at Walkerville, reports the mill working on custom as well as company ores. During the year he has opened up new ground.——There is more activity among the silver producing mines of the Butte district than at any time since 1893. Many of the properties are being operated under lease, and many of the lessees are making money. A number of rich strikes of silver ore have been reported recently. On the Volunteer addition, a few days ago, a property owner was digging a well, and at a short distance from the surface uncovered a rich ledge of silver ore, upon which work has already been started.——It is said the Silver King will resume work again. The owners claim they are 50 feet inside their side lines, and the same distance from the Plymouth lode claim. A survey of the ground in dispute is being made.

Loomis *Prospector*: The Bull Frog group, under the management of Del Hart, which recently began work, has 10 men, and the water is nearly out of the 120-foot shaft. The shaft is to be sunk to 500 feet and drifts run at every 100 feet. A steam hoist will be put in.

NEVADA.

Pumping operations at the C. & C. shaft, Comstock lode, continue successfully but slowly. The rise and fall of the water mentioned in the superintendent's report is probably due to the fact that the elevator takes water from the shaft faster than it comes into it from distant workings. Atmospheric pressure in some of the abandoned stopes may have some influence on it, causing the water to seek its level spasmodically. The following telegram was sent on to San Francisco:

VIRGINIA, Nev., Aug. 10, 1899.

To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco: At 6:30 this morning the water was 24 feet below the 1050-foot level station, having risen and fallen during the last twenty-four hours, while the elevator has worked regularly and continuously. G. McM. Ross.

Reno *Journal*: After several years of unsuccessful experimenting, the bed of tailings at the old English mill is worked satisfactorily by the process known as chloridizing, or roasting with sulphur and salt, after which they are run through the amalgamating vats. Nine tons of tailings are being roasted per day, with salt and pulverized iron sulphurets obtained near Washoe City. Six men are employed on the roasting furnace, working three shifts. A charge of 750 pounds is drawn from the furnace every hour. The roasted tailings are transferred to the amalgamating vat, which takes 2800 pounds at a charge, and runs four charges per day. Two men are working on the pans, each working twelve hours a shift. The tailings assay fourteen ounces of silver and from $4 to $6 per ton in gold. Of this it is estimated that from $8 to $12 per ton is saved. Amalgam weighing from 120 to 160 pounds is retorted every other day.

Salt Lake *Tribune*: It is reported that large outcrops of copper-bearing material have been discovered east of the Cortez district and fourteen miles east of the Eureka & Palisade railroad. From the same source it is learned that at a camp fifty miles south of Battle Mountain on the Battle Mountain & Austin railroad, in Ravenwood district, several locations have been made that show from 14% to 28% copper, $6 to $20 in gold and about 80 ounces silver. This last find is not far from Old Jersey district, that produced thousands of tons of high-grade lead ore in former days.

OREGON.

(Special Correspondence).—The Virtue Consolidated mines include the original Virtue and the Collateral groups, which lie in a body eight miles east of Baker City. The Virtue grounds are developed by an 800-foot shaft, sunk close to the vein, and from which extensive drifting has been done on the vein at the 350, 470, 500, 600, 700 and 800-foot levels. The Collateral has five tunnels on the vein, which are from 70 to 100 feet apart, vertically. The two groups are on different ledges, the ores from which, however, are similar. In the Virtue the vein is from 2 to 6 feet in width, and that on the Collateral is from 1 foot to 4 feet. The ores are free milling and are run through a 20-stamp mill on the ground. A pumping plant of good capacity has to be operated to keep the mine clear of water. The company owning this group also own the Cumberland at Silver City, Idaho. The Con. Virginia, near the Virtue, is equipped with machinery, but is idle, due partly to an excess of water, it is said.

The Flagstaff mine, situate four miles west of the Virtue, belongs to a London company and is under the management of N. E. Imhouse, with W. O. Reynolds as superintendent. It is developed by an inclined shaft 728 feet deep, which follows the dip of the vein. There are six levels at 100-foot intervals, aggregating 1500 feet of drifting. The ledge has a width of from 3 to 8 feet between walls, carrying a pay streak of ore from 13 to 18 inches wide. A blind lead was recently struck. The values in the mine run from $8 to $25 per ton, as shown by treatment in the 10-stamp mill on the property. Twenty tons per day are milled. WASCOTT.

Baker City, Or., Aug. 1st, '99.

SOUTH DAKOTA.

Deadwood *Mining Review*: The Esmeralda mine and mill in Blacktail gulch have been leased and bonded to a Boston syndicate, which will erect a cyanide plant with which to treat the conglomerate. The Esmeralda is owned by E. Faust & Son and there is a large amount of ore that will average $8 a ton gold. Blacktail gulch is two miles in length. R. M. Maloney has demonstrated that the low-grade cement ore is amenable to the cyanide process and a large number of companies are starting up old mines to be worked in this way. The ore is conglomerate, the values being contained in the softer cementing material.——The Adams Express Co. is figuring on erecting a cyanide plant at the Boley mine.——B. C. Cook, who owns a part interest in the Omega mine at Terraville, is making arrangements to put in a cyanide plant in connection with a 10-stamp mill at the mouth of Deadwood gulch.

UTAH.

Before a subcommittee of the Industrial Commission at Salt Lake last week Supt. Terhune of the Hanauer Smelting Works was questioned generally on the mining industry of the State. He thought the industry was in a prosperous condition, and much advanced over conditions 20 years ago. He spoke favorably of the eight-hour law. He said that there were no labor unions in the State, and that the men seemed to be satisfied with their conditions. Referring to trusts, he said he did not favor any conditions that destroyed competition. A. Hanauer, manager of the Hanauer smelter, did not approve of the eight-hour law being applied to smelters, but said that the law was all right so far as it applied to mines. He thought a ten-hour day was preferable for smelters. He believed there was more profit in mining silver at present, with silver at 60 cents per ounce, than when silver was 90 cents per ounce, owing to the reduced cost of supplies. He did not believe the smelter combine would work any injury to the mining industry.

Salt Lake *Tribune*: In La Reine of Tintic a strike has been made of copper glance, malachite and azurite, with a black sulphuret of silver, in the upraise from the main workings off the tunnel level.——Assays from the auriferous chute in the properties of the Eagle M. Co. at Mercur show 498 ounces in silver and 6.5% copper.——Lewisohn Bros., who last season bought the Copper Mountain group in Box Elder county, will erect a smelter. G. K. Fischer, who designed the plans for the Highland Boy smelter, is engaged on plans for the proposed one. J. P. Channing, the representative of Lewisohn Bros., will have charge of construction. According to the plans, the new smelter will be equipped with but one stack at the start, although provision will be made for an enlargement.——At the Centennial Eureka a new strike in the winze below the 600-foot level is reported and everything indicates that the chute of high-grade ore which was opened up this season is as continuous as that from which the previous millions were taken.——At the Highland Boy smelter preparations are being made for another shipment of copper, gold and silver bullion. Two hundred thousand pounds are stacked up in the bullion room. Changes in the third furnace are being made and the output will be increased in a few days.——At the Big Indian group in the La Sal region it is understood an examination is being conducted by the Messrs. Rogers of Colorado.——The discovery of a gold field near Marysvale in Piute county is reported. L. Bartholomew and associates, who discovered the district, have staked forty claims.——In the La Sal region in Grand county there are 300 men scattered over the country and improvements are being made. In Miner's basin, Mill creek, Beaver basin, Geyser and Middle mountains and Sylvanite basin claims are being worked with good results.

WASHINGTON.

H. Hewitt, Jr., has bought twenty-six mining claims near Index for $30,000 and will develop them.

In Republic camp, on the Vulcan, west of the Merrimac one-fourth of a mile, the ledge is showing up 5 feet of quartz that averages $5 per ton in gold. It is said a Seattle syndicate will develop it.

The Gold Ledge, at Republic, has been shut down on account of water. No more work will be done until after a steam hoist and pumping plant have been installed.

J. Ross, one of the contractors on the Copper Mountain tunnel, reports an average of 3 feet per day being made in the tunnel. The high-grade ore encountered a few weeks since continues. The ore carries galena, silver and gold.

The new tunnel on the North Star is in 180 feet. Two ledges have been cut, one 150 feet from the mouth and the other at the face of tunnel. They are each 5 feet in width. The last is being drifted north and south.

At a recent meeting of the directors of the Surprise M. & M. Co., in Cedar canyon, it was decided to continue the shaft 100 feet, and a contract was awarded S. H. Webb, formerly superintendent of the Elephant in the same camp.

Spokesman-Review: A strike has been made in the Deer Trail No. 2 mine, in Cedar canyon. The vein has been drifted upon for 45 feet. The ore has widened to 3 feet. Two samples returned $15.31 lead and $119.10 silver, and $125 silver, $1.13 lead. This strike is 200 feet from any of the older workings on the claim. Ore is being stoped in all parts of the mine.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The first discovery of gold in the Kamloops, or Coal Hill mining camp, was made June 6th, '96, and since then 500 claims have been staked, 200 of which have been partly developed. The Copper King, Iron Mask, Iron Cap, Lucky Strike, Pothook and Mammette Lake have each shipped several carloads of ore to the smelters at Everett, Swansea, Trail and Nelson. The ore shipped averaged 18% copper and $5 to $12 in gold to the ton. While the principal ore bodies are copper-gold, there are several good showings of free-milling gold. Two weeks ago a rich strike of free-milling gold was made by J. Dillon at Jacko Lake, six miles south of this city. The claim was named the Last Rose of Summer. The vein at the surface is 14 inches wide, which, at a depth of 10 feet, had widened to 22 inches. Four assays gave values of $16, $9, $111 and $258 to the ton. This property has been bonded, through Messrs. Robinson, Redman and Outhett, in Cannington, Ontario. The Noonday is also showing values in free-milling gold. The shaft is down over 100 feet, and at the 90-foot level is a 100-foot drift running easterly. The Pothook, the best developed mine in the camp, has shut down part of its works to install its new machinery. The new plant consists of a 50 H. P. hoisting engine, fan and six compressed air drills. The shaft on the Pothook is down 357 feet and the drifts will aggregate 1100 feet. The ore averages 8% copper and $4 gold and there is now a large amount of ore in sight. A Glasgow syndicate owns the Pothook. The Python is working ten men under the superintendency of W. F. Wood. This mine is owned by Montreal capitalists. The company proposes erecting a concentrator this fall. A 1000-foot wire tramway is being built from the mine to the site of the proposed concentrator. Messrs. Rand, Flack & Co. of Vancouver have offered $100,000 for the Copper King, which was refused. A quarter interest in the five claims owned by the Coal Hill Copper Mines Co. has been sold to the Paris Mining & Exploration Co. of Paris, France. The owners of the War Eagle at Rossland have had their agent here looking over the Mammette Lake properties. The Iron Mask, owned by N. C. Wallace and Armstrong & Cook of Toronto, is idle. The Dawson has been bonded to Moncton & Colhoun. It will be worked. L. Boillott of Paris, France, is here purchasing properties for the Paris Mining & Exploration Co.

Kamloops, B. C., Aug. 2nd, '99.

NEW ZEALAND.

During the month of April the New Zealand Crown mines at Karangshake crushed and treated 2681 tons of quartz for a return of bullion valued at £6007. The best previous return was for the month of July, 1898, when 2500 tons were crushed for a return of £5891. Compared with the last return, that just to hand shows an increase of £355, although the quantity of ore was fifty tons less. The yield of £6007 gives an average of £2 4s 9d per

ton. The total value of the bullion from the New Zealand Crown mines amounts to £212,268.——During the month of April the Talisman company's mill ran twenty-two days, and treated 788 tons of ore, which yielded £3338 9s 3d, or at the rate of £4 4s 9d per ton. The return is under that of the previous month, when 900 tons of ore returned £3609, but a higher average per ton has been realized this month.——The Komata Reefs Co. crushed and treated 340 tons of ore during April for a yield of £650.

SOUTH AFRICA.

Johannesburg *Mining Journal*: There is a noteworthy reduction in the number of native miners deserting from their contracts. The time-expired still refuse to re-engage, and the number of natives coming forward from the sources of supply is insignificant.——The pioneer borehole has reached a depth of 800 feet. The sinking engine designed to hoist from the 2000 level is erected and the shaft down 130 feet. The Cinderella is popular with the natives. No premium has been paid to secure labor, but more than sufficient boys have sought employment of their own accord.——At the Simmer & Jack Proprietary Mines development continues to improve and the forty stamps going up will crush ore of as good grade as is now being milled. The mines of the Consolidated Gold Fields group have felt the slackness of native labor very little. The Simmer has been especially fortunate in this respect. The new forty stamps will be ready by October or November. The cyanide plant has to be enlarged proportionately.——At the Robinson Deep the native compound is being enlarged and improved for the purpose of making the mine more attractive to native miners. This detail of policy is very essential in deep level mines which have reached the producing stage.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUGUST 1, 1899.

629,975.—VESSEL-LOADING PLATFORM—C. R. Allen, S. F.
630,164.—CIGAR BAND CUTTER—S. J. Ballard, Los Angeles, Cal.
630,187.—FRUIT EVAPORATOR—B. Cunningham, Liberty, Or.
630,198.—BICYCLE GEAR—A. Doyle, Seattle, Wash.
630,231.—COPY HOLDER—L. Hudgin, Lochiel, Ariz.
630,306.—EQUALIZER—C. R. Murray, S. F.
630,002.—AIR BRAKE SIGNAL—Nethercott & Hersch, Alameda, Cal.
630,097.—BOX PLATE FOR LOOMS—J. H. Northrup, Tustin, Cal.
629,813.—MATCHER HEAD—W. W. Philbrick, Seattle, Wash.
629,814.—MATCHER HEAD—W. W. Philbrick, Seattle, Wash.
630,006.—WAVE POWER—J. Rogowski, S. F.
31,312.—DESIGN—O. H. Greene, Chico, Cal.
31,296.—DESIGN—W. A. Russell, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AIR BRAKE SIGNAL.—J. H. Nethercott & J. W. Hersch, Alameda, Cal. No. 630,002. Dated August 1, 1899. This invention relates to improvements in air brake devices. It consists essentially of a chamber containing a whistle or signal controlling valve and interposed between the engineer's valve and the main auxiliary reservoir, with which one end of the chamber is connected, a connection is made between the other end in the train brake pipe whereby a reduction of pressure in the brake valve from any point in the train will operate the valve and actuate the signal without the use of a supplemental signal pipe. In conjunction with this is employed a lock or stop device actuated by the discharge from the engineer's valve so that the signal actuating valve is prevented from moving and the signal from being operated.

PORTABLE VESSEL-LOADING PLATFORM.—Charles R. Allen, San Francisco, Cal. No. 629,975. Dated August 1, 1899. This invention relates to a device which is designed for the loading of vessels from wharves, and is particularly adapted to discharge from wagons directly upon the vessel's deck or into the hold. It consists of a platform, means whereby it is supported above the level of the wharf, an inclined driveway, a means by which it can be detachably connected with the platform, an extension of the platform which is adapted to be projected beyond its edges and over and beyond the edge of the wharf, so that a load can be driven upon the platform, then moved out upon this extension and discharged directly upon the deck or into the hold of the vessel.

WAVE POWER WATER MOVING APPARATUS.—John Rogowski, San Francisco, Cal. No. 630,006. Dated August 1, 1899. This invention relates to a device and apparatus which is especially designed to furnish a supply of water through the action of waves upon a seacoast. It consists of a reservoir or chamber, a pipe leading into the upper portion thereof having a funnel-shaped mouth or opening toward the sea, a pipe leading from the lower portion of the reservoir or chamber, a check valve in the first-named pipe, a valve or gate in advance of said check valve, a discharge pipe connected with the second pipe and a valve controlling the admission of water into said pipe.

Industrial Notes.

—A railroad is projected from Las Vegas to Taos, N. M.

—Wallace, Idaho, will put in a $15,000 sewer system.

—The Utah & Pacific Railroad is completed to Stateline, Nevada.

—The U. P. R. R. has secured control of the new Wyoming Southern Railway.

—The Union Light & Power Co., Salt Lake, Utah, will issue $3,000,000 4% bonds.

—The Santa Fe Railroad pays Japanese laborers $1.10 per day, and is increasing the number of such employes.

—As in California and elsewhere, so in Colorado. Denver reports a scarcity of labor and consequent delay in filling contracts.

—The Burlington Railway Co. will build the road into Keystone, South Dakota, from Hill City, the work to commence immediately.

—It is said the Pittsburg Reduction Co., manufacturers of aluminum, is about to invest $3,000,000 at Shawinigan Falls, Quebec, for the production of aluminum.

—The water power at Winchester, near Roseburg, Or., has been sold to J. S. Johnson of Atlanta, Ga., who intends to utilize the power for manufacturing purposes.

—It is stated in New York that all of the stock of the American Smelting & Refining Co. not heretofore sold, has passed into the hands of the Standard Oil magnates, and the latter have a controlling interest.

—The Boston & Maine railroad, in order to successfully compete with electric roads, it is said, will adopt coke as fuel and sprinkle the roadbed with crude petroleum, thus doing away to a great extent with the smoke and dust incident to steam road travel.

—It is stated that a consolidation of the mica-producing interests of the world is being effected. The Consolidated Mica Co. was formed in June last, and has since succeeded in securing a large number of the heaviest producing mica mines in New Hampshire, the South and Canada. The Consolidated Mica Co. will have a capital of $5,000,000. Its directorate will consist of the leading mica men of the United States and Canada.

—Proposals are to be opened at Pretoria for the construction of two railroads in the Transvaal, South Africa—one from Belfast to Lydenburg, connecting with lines to Pretoria, and one from Pretoria to Rustenburg. The first opening will be too late for American bidders, but the latter will be Oct. 12th. The tenders must be written in Dutch, and in the latter case they must be addressed: "Tender Voor Den Buow Der Spoorweglyn-Belfast-Lydenburg."

—The Yuba County, Cal., Electric Power Co. is expending $600,000 in improvements, dams and reservoirs are being built, sawmills constructed and flumes laid. It is the intention to put in a plant supplying 15,000 H. P. The Nevada County Co. has contracted for 3000 H. P., and 5000 H. P. has been sold to the Folsom Electric Co. Reservoirs have been built in Sierra county, and water will be carried through a mile flume with a capacity of 10,000 inches and piped to the power house, twelve miles below Camptonville, under 940 feet pressure. The foundations for the wheels at the plant will take 7000 barrels of cement. About 500 men are now employed.

—M. Landauer, en route from the Pacific coast to New York, has been in China four years, representing a Parisian syndicate, for which he has secured coal, quicksilver and other mineral concessions in China valued at $100,000,000. He says there are rich mines of cinnabar in Kweechow province and along the Yang-tse-Kiang are copper mines and coal deposits, which he has secured the privilege of developing. Landauer says Europeans and Americans are beginnng to have a realization of China's mineral resources. These have been neglected by the Chinese for 3000 years, because Confucius taught that the tilling of the soil was the safest foundation of any State's prosperity. In consequence the mandarins have not permitted the common people to engage in mining. Now that the opening of China has commenced, Chinese mines will be opened with modern machinery.

—The production of iron ore for 1898 aggregated 19,278,369 long tons, 1,760,323 tons, or 10%, in excess of the previous maximum of 17,518,046 long tons, produced in 1897. This is also a greater amount than has been mined by any other country in one year, being over 1,250,000 tons above the total recorded for Great Britain in 1880, when 18,026,049 long tons were mined. The ores of the British Isles also average lower percentages of metal than those of this country, and therefore represent a smaller pig metal product. The variety of iron ores produced includes red hematite, the output of which was 83% of the total, and brown hematite, which was 10.3% of the aggregate product. Magnetite and carbonate ores make up the remaining 6.7%. The total output in long tons of all varieties by States was: Michigan, 7,346,846; Minnesota, 5,963,509; Alabama, 2,401,748; Pennsylvania, 773,082; Tennessee, 593,227; Virginia, 557,713; Wisconsin, 509,645; Colorado, 318,480; New Jersey, 275,438; New York, 179,951; Georgia and North Carolina, 160,083; Montana, Nevada, New Mexico, Utah and Wyoming, 55,969; Missouri, 50,000; Ohio, 43,868; Kentucky, 12,913; Connecticut and Massachusetts, 20,251; Texas, 9705; Maryland, 5941.

—In appearance tatki, a product of the oil wells of Baku, is a dark, viscous fluid, not more inflammable than vegetable oil and less so than coal. As a steam producer it has no rival, and the demand for this purpose is constantly on the increase. Nothing else is burned on the railways in central Asia, the Caucasus and southern Russia, on the Black sea, Caspian and river steamers, and in the innumerable industrial works which are springing into existence on the Azov littoral. On the railways which employ this substitute for coal locomotive tenders carry a sheet-iron astatki tank, filled by pumping. The result is an intensely white, roaring flame, and in pulverizers of the latest type the value of astatki as compared with coal as a steam raiser is as 2½ to 1. The former sells at Baku at $2.50 per ton, and when the pipe line connecting that place with Batoum is complete astatki will be delivered at the steamer's side at $4.

—The United States Consul to Venezuela, discussing the mineral deposits of Venezuela, says: "Its mineral deposits are exhaustless, and include everything from iron in abundance to gold and diamonds. The district south of Orinoco will probably become the great gold-producing region of the world. Already an American company is operating with dredgers in the tributaries of the great river, and has met with success. Placer mining is also carried on by individuals, who seem to thrive at it. On the Imatac, a small tributary, 75 miles from the Orinoco's mouth, are vast deposits of iron, controlled by an American syndicate, at the head of which is J. E. Searles. The hidden wealth in this region, according to competent engineers, is almost beyond estimation, and there is no doubt that it will be fully exploited, as the company is abundantly able to carry out its schemes. The crying need is a railroad from some point on the river to mines in the interior. I am confident that American capital could find no better field for investment. Mining is expensive now simply because supplies reach the camps only by pack trains, and the journey is tedious and laborious. The Government of Venezuela would undoubtedly subsidize a railroad company whose promoters could produce proper evidence of good faith."

Commercial Paragraphs.

WALLACE & HART have opened an assay office at Baker City, Oregon.

C. DUCOMMUN & CO., of Los Angeles, Cal., who handle a complete line of assayers and laboratory supplies, are of the opinion that the long credits demanded by Mexican houses preclude extensive business with that country in their lines. This matter will doubtless gradually adjust itself, by concessions being made on both sides.

ONE of the highest pressure pipe lines in California has just been completed by the Lacy Mfg. Co. of Los Angeles, for the Mt. Whitney Power Co., on the Kaweah river. The line has a fall of over 1300 feet and develops 1800 H. P. Owing to the character of the country the engineering difficulties were unusually exacting.

A. A. BAILEY of Los Angeles, Cal., the first man there to manufacture spiral packing for the jobbing trade, handles a large proportion of the Southwest trade in packings and engineer's supplies. He manufactures expansion and sectional packing, gaskets, lubricating oil, boiler compound and babbit metal, and carries the "Reliable" oil feeder pump.

THE contract to supply the smelter, sampling works and roasters of the Val Verde, Arizona, Copper Co. has been awarded to the Colorado Iron Works Co., of Denver, Colo., represented by S. W. Traylor, and a payment of $22,000 has been made on account by the company's manager. The smelter will be of the latest improved style. Mr. J. W. Evans, general manager and superintendent Colorado Iron Works Co., is now on the site, overseeing the construction of the work.

ON the 7th inst., in San Francisco, the annual meeting of the stockholders of the Risdon Iron & Locomotive Works was held and the following directors elected for the ensuing year: Captain W. H. Taylor, William Alvord, R. S. Moore, A. Dalton Harrison, Augustus Taylor, F. G. Drum and L. R. Mead. Mr. F. G. Drum takes the place of Lloyd Tevis, deceased. The following officers were elected: W. H. Taylor, president; R. S. Moore, vice-president and superintendent; L. R. Mead, secretary.

IN a recent interview with a MINING AND SCIENTIFIC PRESS representative, Mr. Scheller, of the Union Hardware & Metal Co., Los Angeles, Cal., stated that while their business had increased some 30% so far this year, he does not feel that this indicates 30% increase in the development of the mining propositions of the Southwest, it being largely dependent on the increase in selling prices and the extensive water developments. He states that the increase in cost of materials is not likely to encourage building of new cyanide plants, in which labor is but a small item. Mr. Scheller feels that the west coast Mexican trade, which should be tributary to southern California, can be made so only by the establishment of a regular and efficient coastwise steamer line. It would doubtless surprise many well informed readers to learn that their normal stock of iron is 15,000 tons, owing largely to the large sizes of merchant bar made necessary to meet the drilling requirements of the Southwest.

MR. C. B. BOOTHE, of C. B. Boothe & Co., Los Angeles, Cal., in an interview with our special correspondent, states that during the last two or three months the lack of water and extreme heat have tended to lessen the work on the mining properties of southern California and Arizona. In anticipation of this condition his house had made arrangements for devoting their particular attention to water development. This work has consisted very largely in the "assisting" of artesian wells. The methods employed are practical and economical and the result of long experiment by Mr. Boothe. They have been peculiarly successful, in most cases restoring the original flow and not infrequently increasing it considerably. Mr. Boothe states that they have devoted their chief energies during the past two years to the installing of pumping plants of high efficiency and economy. Such a plant as this is the one at present being constructed for the Val Verde Water Co., in the Perris, Cal., district. This deep-well pumping plant consists of a Sioux-Corliss high-pressure triplex pump. This is one of the most unique plants recently installed, the water being lifted 300 feet through more than a mile of pipe. They expect to effect great economy in operating it. This firm has the agency for the Stilwell-Bierce & Smith-Vaile Co. of Dayton, Ohio, whose general line of deep-pumping machinery is universally known.

Personal.

PROF. HIRSCHING of Good Springs, Nev., is in San Francisco.

EDWIN BLEWETT has returned to Baker City, Or., from British Columbia.

CAPT. C. H. THOMPSON of Spokane was in Baker City, Or., on the 1st inst.

CHAS. H. FISHER of the Risdon Iron Works is in the Baker City, Or., district.

HARRY ELLIS, a California mining engineer, has located in Salt Lake City, Utah.

J. N. WALKER is the new Supt. of the Government assay office at Everett, Wash.

FRANKLIN RIFFLE is the present manager of the Wolff & Zwicker Iron Works, Portland, Or.

J. H. CONRAD, owner of mines at Norris, Montana, and Bingham, Utah, is in San Francisco.

UNITED STATES Engineers are surveying for a proposed dam on the Mojave river, near Victor, Cal.

SETH HOSKINS has been appointed chief engineer for the Colorado Fuel & Iron Co., Pueblo, Colo.

D. E. BIGELOW, representative of the Union Iron Works, recently visited Baker City, Sumpter and Huntington, Or.

W. E. RITTER, president California Academy of Sciences, has returned to San Francisco from a scientific trip to Alaska.

J. W. WATT has gone from Mercur, Utah, to take charge of the assaying department of the S. M. & M. Co., Silverton, Colo.

I. C. STODDARD, Pres. Stoddard Copper Co., of Arizona, says he is going to buy $100,000 worth of machinery for that property.

G. E. PRICE, M. E., Helena, Mont., representative of Fraser & Chalmers, has gone to Los Angeles, Cal., accompanied by his family.

J. H. NEFF, president California State Miners' Association, and Lieutenant-Governor of California, is removing from Colfax to San Francisco.

H. B. BENNISON of San Francisco was in the Baker City, Or., region last week. He and associates are operating the Badger mine on the John Day river.

WARNER MILLER, ex-Governor of New York, is at Auburn, Placer Co., Cal. He, with other Eastern capitalists, is interested in the Pine Hill mine, near Auburn.

JOHN LAMBERT, Pres. American Steel & Wire Co., has gone to Paris to arrange for the exhibit of the American Steel & Wire Co. at the exposition next year.

THOS. NEILSON, till recently assistant at the Keswick, Cal., works, goes to superintend operations at the property of the Neilson M. & S. Co., Redrock, Arizona.

BLEWETT & SON, who opened and now own an interest in the Van Anda copper mine on Texada Island, B. C., are developing the Van Anda gold mine near Sumpter, Oregon.

J. O. NORBOM of the Union Iron Works, San Francisco, is at Greenwood, B. C., with Paul Johnson, in connection with the projected building there of an up-to-date smelter.

W. J. ADAMS has returned to California from Lutaya bay, Alaska, where he had been superintending the inception of a placer mining enterprise. His temporary address is 224 Sansome St., San Francisco.

COL. S. H. LUCAS, of Mokelumne Hill, Cal., is in San Francisco. At his Calaveras county mine he is daily crushing thirty tons free-milling ore, the total cost of mining and milling of which is less than $1 per ton.

A. H. TEN BROECK, Mgr. Gold Bug mine, El Dorado, Cal., has resigned and is succeeded by W. E. Thorne, whom Mr. T. has had placed in charge while he will visit New York State to secure capital for further development.

CHAS. BUTTERS and Thos. Good are credited by the Salt Lake, Utah, *Tribune* with a probable consummation of a plan to consolidate the principal cyanide process companies with the MacArthur-Forrest Co., with the idea of affording better opportunity to the customer with no increase in the cost.

A. H. WICKHAM, who for two years past has been Supt. of the cyanide works at the Camas No. 2 mine, Idaho, has gone to Glenwood Springs, Colo., to take charge of works there. H. R. Case, who has been Mr. Wickham's assistant, succeeds to the superintendency of the works at the Camas No. 2.

F. H. NEWELL, United States Geological Survey, Washington, D. C., is in San Francisco. He has charge of the U. S. work looking to the conservation of water throughout the west half of America, and, after extended research in Colorado, Utah and Arizona, is now going through California en route to Idaho and Montana.

Recently Declared Mining Dividends.

Empire State, Idaho, M. Co., monthly dividend of 2%; payable Aug. 15.

Gwin Mine Development Co., California, dividend No. 9, 5 cents per share, $5000; Aug. 8. Total to date, $81,500.

How to Solder Aluminum.

A circular issued by the Pittsburg Reduction Co. concerning aluminum soldering says:

The soldering of aluminum has always been a difficult problem, and the problem has not been, up to the present time, completely solved.

The difficulties in soldering aluminum arise from the high heat conductivity of aluminum, and the fact that none of the ordinary soldering salts, or any easily obtainable soldering salt, will clean the surface of aluminum.

On account of the high heat conductivity of aluminum the heat from a soldering iron is conveyed away from the iron and from the solder so rapidly that the solder does not become sufficiently liquid to flow rapidly. This can be overcome to a large extent by taking steps to counterbalance the spreading of the heat. If the aluminum pieces to be soldered are small and thin, then, naturally, the difficulty is not so great as when the aluminum pieces are heavy and absorb a large amount of heat. In this latter case the soldering iron should be kept at a higher heat than is usual, and the aluminum pieces should, if possible, have been warmed beforehand.

Whereas aluminum is properly spoken of as a non-oxidizing metal, nevertheless the surface is covered with a very thin film of oxide, which prevents the solder from amalgamating with the aluminum. The most natural and simple way to remove this coating is to scrape it off with emery cloth or a file. If this is not possible, then it can be done by dipping the edge to be joined in a solution composed of about 1 part hydrofluoric acid, 10 parts nitric acid, 50 parts water; or in a solution, first, of caustic soda, and then strong sulphuric acid.

Many manufacturers, after some attempts with indifferent results, are now soldering aluminum with considerable success. Experience seems to be a very important factor in the successful accomplishment of the soldering of aluminum. A workman who, perhaps, is experienced in the soldering of other metals will meet with considerable difficulty in the soldering of aluminum, but these difficulties become less, and in time practically vanish as the experience of the workman increases.

The Pittsburg Reduction Co. do not, however, recommend soldering if any other means of making a joint can be employed. Several joints in aluminum, even when well made, are not as strong as soldered joints in other metals, and, on account of the galvanic action between the solder and the aluminum, the joint will gradually disintegrate, especially if by exposure to water or by other means the conditions are particularly favorable for galvanic action. In dry places, however, a soldered joint will apparently last an indefinite time. Samples of soldered joints submitted to the Pittsburg Reduction Co. a number of years ago, and which have been kept in the office, are quite as good now as when first sent.

In view of the high heat conductivity of aluminum, it follows that a solder which will melt at as low a temperature as possible should be used. There are a number of solders on the market having this characteristic, or one can easily be made to suit the occasion. Nearly all aluminum solders contain a small portion of phosphor tin.

Work of the Glacier.

Rivers work openly where people dwell, and so does the rain and the sea thundering on all the shores of the world; and the universal ocean air, though unseen, speaks aloud in a thousand voices, and explains its modes of working and its power. But glaciers, back in their cold solitudes, work apart from men, exerting their tremendous energies in silence and darkness. Coming in vapor from the sea, flying invisible on the wind, descending in snow, changing to ice, white, spirit-like they brood, outspread over the predestined landscapes, working on unwearied through immeasurable ages until in the fullness of time the mountains and valleys are brought forth, channels furrowed for the rivers, basins made for meadows and lakes and soil beds spread for the forests and fields that man and beast may be fed. Then, vanishing like clouds, they melt into streams and go singing back home to the sea.—John Muir.

Some Electric Traction History.

All of the earlier inventors used motors of too small power for the work they had to do. When this lesson was learned, there came the difficulty of designing motors of sufficient capacity, and, at the same time, small enough to get into the space available for them under the floor of the car and between the car axles. In order to make the motors small enough to get into this space and to decrease their cost and weight, it was necessary to run them at high speed, and gear down to a lower speed at the car axle.

Various devices were used to accomplish this, such as belts, cables, cranks and connecting rods, bevel gears and others; but spur gears were finally found to be the most serviceable. Sprague hoped to use a single reduction with a pinion on the armature shaft and a large gear on the axle, but was finally forced to give up this idea because none of the manufacturing companies were, at this date, able to design a motor to run at the speed required for single reduction which would be small enough to get into the space at his disposal. He was forced, therefore, to put in an intermediate gear, into which the armature shaft pinion meshed, and which, in turn, meshed into the axle gear.

Sprague first suggested making the car truck a separate structure from the car body and proportioning this structure to bear the heavy strains brought to bear upon it by the motor. He also centered the motor frame upon the car axle by means of a sleeve cast upon the motor frame and lined with a brass bushing within which the car axle could turn. This eliminated a great difficulty by keeping the centers of the gears at a constant distance from each other. It also enabled him to suspend the free end of the motor frame on springs, since that end could then have a certain amount of play up and down about the car axle as a center without causing the gears to get out of mesh. The destructive pounding of the motor on the truck and on the rails was thus obviated.

While this lessened the sledge-hammer blows of the car wheels on the rails, the rails in use with the old horse cars were not heavy enough to stand the pounding that still remained, and the result was that the cars were soon running over a series of ridges like the waves of the sea, caused by the sinking of the rails between the cross-ties, and the rail joints were battered out of shape until the bumping recalled the corduroy roads of earlier days.

The motors themselves were a never-ending source of trouble, both because they were not of sufficient power and because they were not well enough protected from dust and water. There were many other minor defects as well. The heavy loads brought on motors of small power were continually resulting in blow-outs, and the necessity of running the motors below the floor of the car and very near the ground made every mudpuddle between the tracks a source of anxiety, since the commutator and the windings of the motor were not protected or incased so as to keep the water out.—Thorburn Reid, in the Electric Railway Number of Cassier's Magazine.

WHAT is claimed to be the largest block of marble ever quarried was recently taken out of the Marble Hill quarry, near Marrietta, Ga. This block is 27 feet 2 inches long, 4 feet 4 inches thick and 4 feet 3 inches wide. It contains 500 cubic feet and weighs about 100,000 pounds. It was recently shipped from Marble Hill to Providence, R. I. It was carried on a special car, which was built for carrying large guns. The company claims that this block exceeds in weight by nearly 40,000 pounds any heretofore quarried in this country.

Ammonia Process in Reduction of Copper Ores.

At Good Springs, Lincoln Co. Nev., Prof. H. Hirsching, formerly of the Salt Lake, Utah, Mining Academy, has recently installed an innovation in the way of an extensive plant for the treatment of copper ores by a process invented and patented by himself. The plant has a crushing capacity of 100 tons daily and a leaching capacity of thirty-five tons.

The plant was constructed by the Risdon Iron Works of San Francisco, Cal., and consists of a crusher, two sets of rolls, trommels, elevators, conveyors, etc. The motive power comprises a 100 H. P. boiler and a 60 H. P. engine. The leaching plant is arranged on a series of terraces and comprises thirty-six vats. The solutions pass from top to bottom by gravity, and, when the copper has been extracted, the solution is pumped back to the storage tanks for reuse without having deteriorated.

The ore, which is chiefly oxide and carbonate of copper in a silicious gangue, averages 14% copper. It is crushed dry through a fine screen and subjected to leaching by what is called by Prof. Hirsching his ammonia process. In two hours the copper is dissolved and subsequently recovered as a finely pulverulent black oxide of copper, in which form it is marketed; but as the market for this material is limited, a portion will be melted into bars and sold as metallic copper. The secret of the process is not made public, as the various operations are not fully protected by patents. The ammonia is said to be recovered with practically no loss or deterioration.

The ore deposits of the region occur at contact of eruptive rocks with an underlying crystalline formation. The ores contain gold and a small amount of silver in addition to the copper contents.

Prof. Hirsching says that he intends to employ the cyanide process in the treatment of the tailings, the objectionable copper having been removed.

An important feature claimed for this process is that it will treat sulphide copper ores at a cost considerably below that of smelting, which, if true, will constitute it an important factor in the reduction of copper ores generally.

To Weld Joints.

The City & Suburban Railway Co. of Oakland, Cal., has been preparing to weld the rails in their tracks with a cast iron joint fused to and becoming a part of the rail, thus acting as a bond for conducting the current and avoiding all trouble from low joints which cause wear and tear on cars, brakes and motors.

A sand blast apparatus, mounted on a dray, passes over the road first and clears the ends of the rails as far back from the joint as is necessary, making them as clean and bright as a silver dollar. The blast is supplied from a reservoir fed by air compressors run by a motor connected with the trolley wire. When the rails are cleaned and the sockets attached over the joints the cupola comes along and completes the welding of the rails.

The sand blast is a simple but effective and rapid operation, and, after once well started, can be worked at slight expense to the company.

The welding machine which follows this and completes the work is a portable cupola, or melting furnace. This one has a diameter of 30 inches by 8 feet in length. It swings upright in chains in the front of a car built for the purpose, the bottom reaching close to the roadbed between the tracks. The molten metal is drawn directly from the bottom of the cupola, on either side, as may be required for the joint.

The cupola is lined throughout with fire brick, with sheet asbestos between the brick and stack, and every precaution is taken to protect it from the intense heat necessary to convert the pig iron and scrap wheels into a liquid mass for use. An upper platform is built on the car, which enables the operator to look down the chimney and see how the cooking is going on.

The cupola having been properly charged with coke, pig iron, etc., carefully weighed in, the fire is started and the air blast from a rotary blower turned on, and this blower is driven by a motor on the car, attached to the trolley wire. The weld consists of a cast-iron socket or cup, in two pieces, bolted to the rail in place of the fish plates. This cup is narrow at either end, but swells at the middle to 6 or 8 inches at the center, according to the size of the rail operated upon. This swell in the cups extends beneath as well as on each side of the joint. A little hot metal is poured in several of these to heat up the ends of the rails, and is followed by another ladle and the cup filled up. This first warming up prevents a "chill" on the casting and allows it to fuse with the rails, cups and connecting bolts, making a perfectly solid joint, amalgamating the rails with the joint, so completely that no other bond is required for free passage of the current. It requires twelve men properly to operate the cupola and move the work along in proper shape. It is hot stuff they are dealing with, and there will not be much loafing around the job while the iron is hot. They will be able to melt 150 joints in twelve hours, when the work is once fairly under way. This work will be done at night, as it can, of course, be done more rapidly and better when there are no cars running to interfere.—Oakland Enquirer.

Electric Plant at Sault Ste. Marie, Mich.

The Michigan Lake Superior Power Co. has projected and is now constructing at Sault Ste. Marie, Mich., the works required for the development of power from the falls of the St. Mary's river at that point and the waters of Lake Superior.

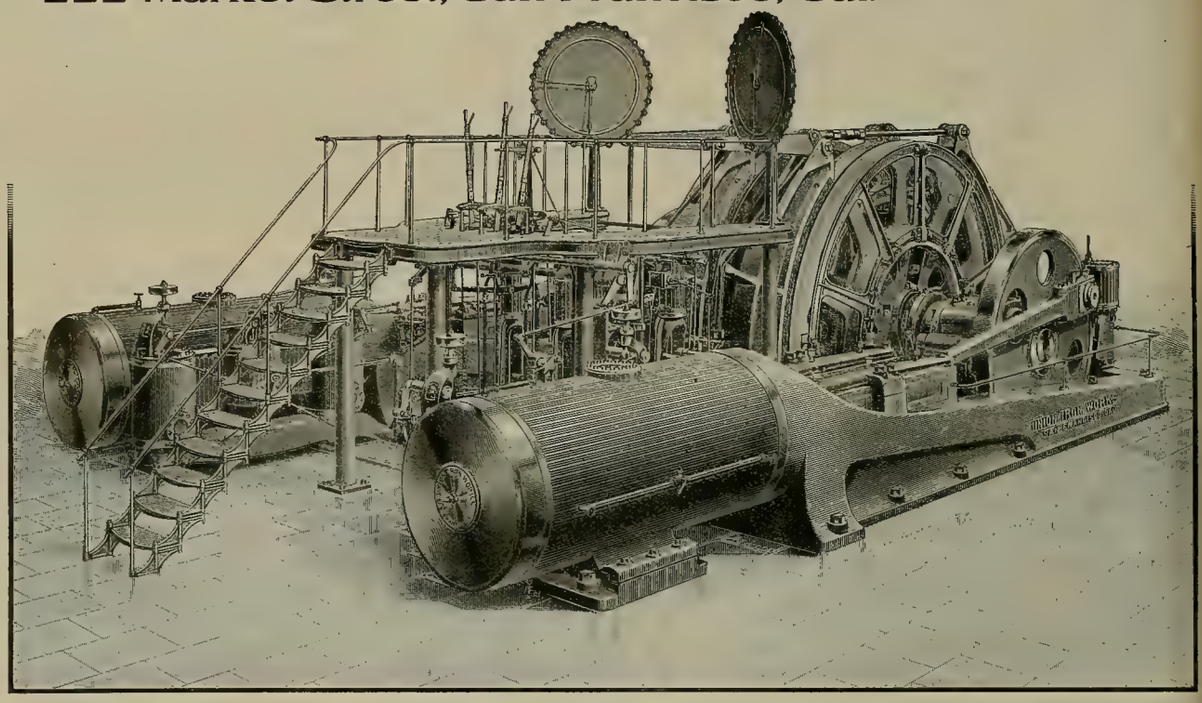
The difference in the mean elevation between the water surface above and below the falls is about 19 feet, and the mean discharge over the outflow section at the falls about 70,000 cubic feet per second. The extent of this development is planned to be such that 40,000 H. P. of electrical energy will be realized, the available effective head being accepted at 16 feet and the volume of water required at 31,250 feet per second. The works now being constructed for this development consist of the intake, the canal, the forebay and the power house, all of which are designed, as to dimensions, to conform to the hydraulic conditions required by the general result to be secured.

The basis from which the hydraulic conditions have been evolved is the realization of 40,000 H. P. of electrical energy, to be available at any point within three miles from the power house for manufacturing purposes. The origin of this energy is to be from single-phase, low-voltage electric generators, coupled directly to the horizontal shafts of turbines, which latter are conditioned to develop 45,243 mechanical H. P., thus providing for the losses entailed during the converting, transforming, transmitting and retransmitting of energy; or 45,243 H. P., converted with 7% loss, will net 42,077 low-voltage electrical H. P., which, transformed with 1% loss, will net 41,655 high-voltage electrical H. P., which, transmitted with 3% loss, will net 40,405 high-voltage electrical H. P., which, retransformed with 1% loss, will net 40,000 effective electrical H. P.

The turbines are to develop a mean efficiency of 80% for a range of three-fourths to full gate opening, and the development of 45,243 mechanical H. P. on the shaft, therefore, requires a gross hydraulic power of 56,554 H. P. —Electrical Review.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.
